Lutyens's stylistic juxtapositions and contradictions enriched his interiors in ways which attract the attention of Postmodernists. When Lutyens's simple vernacular forms were set in more sophisticated surroundings, or when one part of a building announced a style or image contradicted inside, Lutyens created a "fictitious history," an unfulfilled expectation (irony), or (as Robert Venturi observed) a "complexity and contradiction in architecture." Thus, Marsh Court, near Stockbridge, Hampshire (1901–04, 1924), a Tudoresque evocation of English manorial life executed in local Hampshire chalk, echoed through its E-plan, its multiple bays and tall chimneys, and its courts, various formal elements ranging from late medieval to 17th-century England. Inside, Lutyens introduced Artisan Mannerist detail, classical accents, and elaborately carved 17th-century furniture, from Cromwellian chairs to Jacobean tables. Marsh Court's dining room was paneled in walnut and accented with a vast polygonal "ceiling compartment," or shallow dome – what 20th-century decorators might call a "tray ceiling." In the billiard room, he positioned a chalk billiard table in the center of a 17th-century-style interior accented by high paneled wainscoting, prominent windowed bay, and an elaborate plaster ceiling in the spirit of Sudbury Hall (Derbyshire, 1670s). In Marsh Court's hall, Lutyens extended the wainscoting to the ceiling, accented one end of the room with a Palladian arch (positioned to suggest a medieval screen's passage), incorporated an Artisan Mannerist fireplace (reminiscent of Robert Smythson's Bolsover Castle, 1612ff), affixed wooden pilasters over wall panels and detailed their wooden pedestals to suggest cut stone, echoed Sudbury's plasterwork and carving in the ceiling above and in a carved garland frieze capping the Palladian arch, and furnished the room with elaborately carved 17th-century furniture. These juxtapositions were not, as they imply, products of some extended history of alterations within a late medieval building shell, but rather a singular creation of fictitious history by Lutyens.

Lutyens was playing the game of architecture, even as an interior designer. And on the more intimate scale of the decorative arts he introduced wit to his design vocabulary at a time when Modern architecture was distinctly humourless. In fact, he was aesthetically at his most modern in the design of light fixtures. At Marsh Court (and echoed in a similar design thirty years later for the Viceroy's House, New Delhi), Lutyens designed a ceiling light of a single globe bulb whose necking is a flat spun glass disc, fastened in place by wrought iron clips, above which float three ornamental beads. At the Viceroy's House, a whimsical narrative informs the nursery's ceiling

lights, one of which depicts hens and chicks atop a cross piece of the fixture, below which electrical wires hang; these extend to broken eggs which appear to be hatching light bulbs. Another chandelier depicts small Egyptian boys fishing among the bulrushes, their bent poles and fishing lines extending to hanging electric bulbs, below which fish arch up to nibble at the bait. This kind of light-hearted expression, the architect called "vicereations," activities which included amusing people, especially children, with little sketches, singing and dancing, and telling jokes. He also created jokes as a designer: a garden seat at Ednaston Manor (Derbyshire, 1912–14) is in the shape of an elongated wheelbarrow, with wheel at one end and handles at the other so that one could, in the fashion of a farm worker at a wheelbarrow, lift up and move the bench to another location (or dump its occupant?).

The most extensive of Lutyens's interior design projects (with more than 1000 drawings in the Royal Institute of British Architects Collection), was his furniture for the Viceroy's House. Here, he continues his Mannerist tendencies to play with form and style, to stretch or contradict models, to manipulate or exaggerate profiles, and even to show off a little. Architecturally, the Viceroy's House is a tour de force of classical Baroque and Moghul design, through which the symbiotic relationship of emerging nationalist India and an occupying England is masterfully expressed. There were hundreds of rooms to furnish, and antiques were selected for Indian craftsmen to reproduce. Lutyens's office designed many pieces for India, copying (in whole or in part) historic models from William and Mary, Queen Anne, Chippendale, and late 18th century Neo-Classical sources. Other items combined eastern and western themes much as his New Delhi architecture did. An easy chair, for example, was designed with scalloped back, 18th-century arms, lathe-turned stretcher, and bell-shaped feet recalling an Indian throne. A state bed was ornamented with Indian dancers, recalling the same Indian forms in the bell-shaped profile of the skirts. In a state ballroom annex, a table was carved with elephant heads (another recalled tusks in the shape of its supports), and these interior features echoed architectural motifs outside: the road crossing the Viceroy's Court, for example, was marked by elephants sculpted by Charles Sargeant Jagger (1885–1934). Rich in imagery and association, Lutyens's architecture, interiors, and designs for the decorative arts restated, once again, his theme of instant history. The implied accumulation of different period styles of furniture, collected by generations of country house occupants, presented the Viceroy's House much like an English country house, while simultaneously Lutyens referenced local traditions and forms and gave monumental expression to the splendor of Indian culture.

Beginning his career during the "golden afternoon" of the Edwardian era, a period which embraced "progressive eclecticism" and "free classicism" in its search for style, and ending it in the setting sunlight of India, Lutyens remained an accomplished traditionalist throughout a half century of architectural practice. He mastered design at scales ranging from furniture to urban planning. His projects were as varied as his clients; his styles ranged from vernacular to classical. And his sensitivity to context allowed him to build, almost unnoticed, an English cottage sited in the back lanes of a medieval Surrey village, or to site on axis, with impressive public notice, an imperial

courtly architecture which monumentalized a virgin site in a foreign land. Both were exactly right for their place and time. As an interior designer, orchestrating the forms, scale, and spirit of his furniture and the details of his interior fittings, Lutyens reinforced the essential humanism of his architecture. Complex and contradictory, whether vernacular or classic, eastern or western, the interiors of Edwin Lutyens offered a richness which made even more eloquent his architectural expression during a period when Modernist designers were losing their capacity to speak at all.

ROBERT M. CRAIG

Biography

Edwin Landseer Lutyens. Born in London, 29 March 1869, the son of a painter. Entered the South Kensington School of Art, London, 1885. Married Lady Emily Lytton, daughter of the Viceroy of India, 1897; 5 children. Worked in the office of the architects Ernest George (1839–1922) and Harold Peto (1854–1933), 1887–88; opened his architectural office in Surrey, 1889; in private practice, London, 1890–1944. Appointed chief architect for the imperial capital at New Delhi, 1912; principal architect, Imperial War Graves Commission, London, 1916–44. Designed furniture from c.1897, lighting from c.1901. Received numerous honours and awards including Gold Medal, Royal Institute of British Architects, 1921; Gold Medal, American Institute of Architects, 1924. Fellow, Royal Institute of British Architects; knighted, 1918; President, Royal Academy of Arts, 1938–44; Order of Merit, 1942. Died in London, 1 January 1944; buried in St. Paul's Cathedral.

Selected Works

A vast collection of Lutyens's drawings, including over 1000 drawings for the Viceroy's House, New Delhi, is in the drawings collection of the Royal Institute of British Architects, London. Additional architectural designs are in the Avery Library, Columbia University, New York. Examples of Lutyens's furniture survive *in situ* at Castle Drogo, Devon, and the Viceroy's House, New Delhi. Queen Mary's Dolls' House, described as a miniature compendium of his interior design, is displayed in Windsor Castle, Berkshire.

Interiors

- 1897 29 Bloomsbury Square, London (furniture): Edwin Lutyens
- 1899–1902 Deanery Garden, Sonning, Berkshire (building, interiors and furniture): Edward Hudson
- 1901–04 Marsh Court, Stockridge, Hampshire (building, interiors & 1924 and furnishings)
- 1902 Little Thakeham, Sussex (building and interiors): Ernest M. Blackburn
- 1903–04 Papillon Hall, Market Harborough, Leicestershire (building and interiors)
- 1903–04 Lindisfarne Castle, Northumberland (restoration and interiors): Edward Hudson
- 1905–12 Lambay Castle, Ireland (building and interiors): Hon. Cecil Baring
- 1910–32 Castle Drogo, Drewsteignton, Devon (building, interiors and furniture)
- 1912–31 Viceroy's House, New Delhi, India (buildings, interiors, furnishings)
- 1913 Abbey House, Barrow-in-Furness, Lancashire (building, interiors and fittings)
- 1920–24 Queen Mary's Dolls' House, Windsor Castle (building and interiors in miniature)
- 1922–26 Gledstone Hall, Yorkshire (building and interiors): Sir Amos Nelson
- 1925–28 Midland Bank, Poultry, London (building with Lawrence Gotch, interiors and furniture)
- 1928–29 British Embassy, Washington, DC (building and interiors)

M

McIntire, Samuel 1757–1811

American architect and carver

Although trained as a housewright in the artisan tradition, Samuel McIntire became an architect and carver of tremendous importance in Salem, Massachusetts, in the era of the New Republic. For nearly three decades, McIntire dominated the architectural trade in Salem, a bustling seaport town of about ten thousand people north of Boston. His working career, roughly from 1780 until his death in 1811, coincided with Salem's era of greatest prosperity, as its indefatigable and ingenious Yankee traders traveled the earth in search of valuable cargoes. McIntire served as the architect for Salem's wealthy sea captains and merchants. He provided elegant houses for them on Essex Street, Federal Street, and Washington Square, carved their interior woodwork and furniture, and decorated their ships. He also designed courthouses, churches, taverns, gates, and other public buildings and structures, and thus left his aesthetic stamp on nearly every aspect of the built environment. Due to the efforts of local museums and historic preservationists, much of McIntire's legacy survives today.

McIntire's exterior and interior designs grew out of the English vernacular architecture tradition and the experience of house builders in the Salem area. His father, Joseph, and his brothers, Joseph and Angier, were all trained as housewrights. So far as we know, he never traveled abroad and, with a few exceptions, his work was confined to Salem. The English builders' guides and pattern books published by Batty Langley, and William and James Pain, and more formal English design books such as Isaac Ware's *Complete Body of Architecture* and James Gibbs's *Book of Architecture*, were his main sources. The work of Charles Bulfinch in Boston and the surrounding area in the Adamesque mode also exerted its influence on McIntire, whose success depended less upon innovation than upon his ability effectively to translate these sources into his own distinct idiom, developing a style that was widely accepted by his clientele.

Fiske Kimball, McIntire's chief biographer, has divided his career into three phases. His first phase (roughly 1780–92) is typified by the Peirce-Nichols house, built in 1782 and now owned by the Peabody Essex Museum. This large, four-square house along the North River is decorated with tall pilasters at

the corners, and it has a substantial presence characteristic of McIntire's Georgian work. McIntire's middle period (1793–1806) represents a shift away from this robust style to a more elegant, refined, and attenuated Adamesque mode. The carved motifs now recognized as signposts of McIntire's work – cornucopia, clusters of grapes, and baskets of fruit – were used abundantly in this period, and his house plans became more varied, with such features as double parlors, oval rooms, and circular staircases. The highlight of this period, and McIntire's masterpiece, was the mansion he designed and built in Market Square between 1795 and 1799 for Elias Hasket Derby and his wife Elizabeth Crowninshield Derby. McIntire's plan for the house was influenced by a preliminary design provided by Bulfinch and was refined during lengthy negotiations with the opinionated Mrs. Derby. The house was richly embellished with McIntire's carving and stuccowork by Daniel Raynerd, surrounded by outbuildings and lavish gardens, and furnished with magnificent furniture and furnishings. An early visitor remembered that upon entering the house “the door opened into a spacious entry; on each side were large white marble images. We passed on by doors on each side opening into the drawing-room, dining room, parlor, &c., and at the further part of the entry a door opened into a large, magnificent oval room, and another door opposite the one we entered, was thrown open and gave us a full view of the garden below” (Kimball, p. 88). (Unfortunately, both the Derbys died in 1799, shortly after their house was complete. The dwelling, probably the most ambitious house erected in 18th-century America, proved too expensive for the Derby heirs to maintain and it was destroyed in 1815.) The grandeur of the Derby mansion is evoked by the surviving three-story brick Gardner-Pingree house, recently carefully restored by the Peabody Essex Museum, built in 1804–05. Such large brick houses with increasingly spare classical details are characteristic of McIntire's last years (1807–11).

McIntire's work also embraced furniture carving, and more than one hundred objects attributed to his hand have survived, including chairs, tables, and case pieces. Several of these objects indicate that copies of Hepplewhite and Sheraton were included in McIntire's working library. The greatest surviving example of his work in furniture is the magnificent mahogany chest-on-chest of c.1796, now at the Museum of Fine Arts, Boston, made originally for the Derby family. Lavishly carved from top to bottom, this object displays McIntire's skill at

rendering motifs such as urns, cherubs, rosettes, medallions, horns of plenty, and clusters of grapes. (A member of the Skillin family of Boston carved the central allegorical figure.) He was also very active as a shipcarver (although virtually none of this work survives) and several figural sculptures, including portrait busts and eagles, and other carved works by him are known.

Three rooms from Oak Hill, the Danvers, Massachusetts, home of Elizabeth Derby West built in 1800–01, have been preserved in the Museum of Fine Arts, Boston. Although undocumented, they have always been accepted as McIntire's work on the basis of style. In addition to their door surrounds, architraves, mantels, window cornices, and other woodwork, these rooms retain their original overmantel paintings by Michele Felice Corne and are furnished with McIntire-carved furniture and other objects originally owned by the Derby family. They thus present an opportunity to see a meticulously re-created McIntire interior, and to observe the repetition and integration of ornament between woodwork and furniture that is characteristic of McIntire's approach to interior decoration.

McIntire's tombstone notes that "He was distinguished for Genius in Architecture, Sculpture, and Musick." His son, Samuel Field McIntire (1780–1819), followed his father's footsteps for a few years but did not achieve his father's stature. As a significant figure in the transition from traditional builder to professional architect, and as the exponent of a distinguished local Neo-Classical style, Samuel McIntire has earned a distinctive place in the history of early American interior decoration.

GERALD W. R. WARD

Biography

Born in Salem, Massachusetts, the son of a successful housewright; baptized 16 January 1757. Trained as a wood-carver and builder under his father. Married Elizabeth Field, 1778: 1 son, the architect Samuel Field McIntire. Worked in the family business; practised independently as an architect and carver, Salem, from c.1780. Died in Salem, 6 February 1811; architectural practice carried on by his son.

Selected Works

The largest collection of McIntire's drawings and related papers is held by the Peabody Essex Museum (formerly Essex Institute), Salem, Massachusetts. Three rooms from Oak Hill, and examples of McIntire's furniture, are preserved in the Museum of Fine Arts, Boston. For a complete list of his architectural commissions see Kimball 1940.

Interiors

- 1782–1801 Peirce-Nichols House, Salem, Massachusetts (building, decorations and interiors; renovated and redecorated 1801)
- 1786 Second Elias Hasket Derby House, Salem, Massachusetts (renovation and interiors)
- 1791 Simon Forrester House, Salem, Massachusetts (building and interior carving)
- 1793 Nathan Read House, Salem, Massachusetts (building and interiors)
- 1793–94 Derby Summer House, Danvers, Massachusetts (building and interiors)
- 1793–98 T. Lyman House, Waltham, Massachusetts (building and interiors)
- 1795–99 Fourth Elias Hasket Derby House, Salem, Massachusetts (building, interiors and furniture)

- 1796 Assembly House, Salem, Massachusetts (remodelling of building and interiors)
- 1800 Ezekiel Hersey Derby House, Salem, Massachusetts (building by Charles Bulfinch; interior carvings by McIntire)
- 1800–01 Oak Hill, Danvers, Massachusetts (interiors): Elizabeth Derby West
- 1804–05 John Gardner House, Salem, Massachusetts (building and interiors)
- 1805–07 Hamilton Hall, Salem, Massachusetts (building and interiors)

McKim, Mead and White

American architectural practice, 1879–1915

The New York-based architectural firm of McKim, Mead and White formed in 1879, soon after the three men took a special tour of early American buildings along the New England coast. Charles Follen McKim had already shown a professional interest in Colonial American design through a series of photographs taken in Newport, Rhode Island of pre-Revolutionary War

McKim, Mead and White: entrance hall, Isaac Bell House, Newport, Rhode Island, 1882

houses and furniture which he commissioned in 1873–74 as a subscription series for other architects. It was the eyewitness visual impact of these ancient wood frame structures, many of which had fallen into picturesque disrepair that was remembered years later by the men as the prime influence on their new partnership. Along with the growing infatuation for early Americana prompted by the nationalistic tone of exhibitions like the Philadelphia Centennial in 1876 these self-taught lessons in American building traditions immediately informed many of the firm's first architectural projects and those of contemporaries Peabody & Stearns, Bruce Price, William Emerson and Clarence Luce in the 1880s. This revival idiom, combined with influences from abroad such as contemporary English architecture (i.e., Norman Shaw) and oriental design (also represented at the Centennial fair in the form of a vernacular Japanese building) set the course of McKim, Mead and White's design work for over a decade. While much of this aesthetic is manifested on the shingled exteriors of their projects for the decade beginning in 1879, it is clear the firm was equally concerned with creating novel interior spaces and furnishings for their private and institutional commissions.

In buildings like the Casino (Newport, 1879–81), Skinner House (Newport, 1882), Appleton House (Lenox, Massachusetts, 1883–85) and Choate House (Stockbridge, Massachusetts, 1884–87) they totally transformed the balanced grid rectangularity for interior room layouts, typical of American architecture up to that time, into asymmetrical arrays of spaces that flowed more freely into each other. The other rooms were most often grouped around an enlarged, multi-functional hall or fireplace core whose design derived from the historic revival of a grand living hall. This new hall usually included, as it does in the Bell and Tilton Houses (Newport 1881–82), a built-in seating nook, hearth area, cabinetry, elaborate paneling, spindle screens, and other decorative flourishes in metalwork, tile or glass. Its filtered light and low horizontality also provided a transitional and dramatic counterpoint between exterior daylight and the vertical rise of the light-filled main stairwell. Dining, library or other specific use rooms radiated around this stable space which often led to porch and garden access as well. While such halls were the anchoring space around which the rest of the interior was arrayed, they also served more importantly as a means to

differentiate the varied, often conflicting functions of the late 19th-century house as the architects articulated spatial distinctions between public and private, family and visitor, utilitarian or formal, indoors and outside. Many of these spatial and decorative experiments appear in designs for summer houses in the relatively relaxed, resort atmosphere of suburban or rural locales and far removed from the more rigid social conventions to which their clients would have adhered in their primary urban residences.

These innovative interior layouts reflect a struggle on the part of the firm to reconcile a sense of order and planning with the admission that domestic life in the 1880s (at least for a clientele of substance and social standing) needed rooms that conveyed distinctly disparate sensibilities. By mid-decade, this tension pushes their design work toward more urban, formal and classically-inspired solutions as they leave it to the next generation fully to explore (and in the work of Frank Lloyd Wright, receive credit for) this new spatial planning. Although other fashionable firms such as Jules Allard and Sons or Tiffany were employed by McKim, Mead and White to achieve their intended effects, the architects often operated as their own decorating consultants to bring together the designers and artisans needed to execute their original interiors. In the Villard Houses (New York, 1882–86) a sumptuous ensemble of marble veneers and carved ornament inspired by Italian Renaissance sources, mantels and clocks (some designed by Augustus Saint-Gaudens) and mural paintings was configured into a geometric clarity that may have directly inspired Edith Wharton's *The Decoration of Houses*, written in collaboration with Ogden Codman in 1897.

Stanford White often specialised in interior work. His early design sense is typified by the delightful mixture of textures, materials and images in the dining room addition to Kingscote, Newport (1881), which incorporated Tiffany glass and translucent tile work with polished bronze, a cork ceiling and screens. Subsequent projects, such as the large urban and suburban houses of the 1890s, utilized more opulent and luxurious materials to create grand spaces often reflecting courtly European references from France or Italy. White also sometimes collaborated with other major artists – for example, Augustus Saint-Gaudens, Louis Tiffany and John La Farge – to achieve particular elements in his overall concept. In his later efforts, especially those dating from the first years of the new century (private Manhattan houses for Henry Poor, Joseph Pulitzer, Payne Whitney or Charles Dana Gibson; clubs like the Colony; and business blocks such as those for Gorham and Tiffany), he exploits lavish historical sources even as he continually develops a style of decoration which grafts the inventive playfulness of his early career with a profound sense of lively ornamentation tempered by a new-found planarity and restraint.

Perhaps not surprisingly, White also had a substantial impact on turn-of-the century taste for historical furnishings as a dealer. He supplemented his architectural income, often importing artworks, furniture and other architectural details, to fill the houses that he and his partners had designed in a spectrum of revival styles. At one point in the 1890s he installed a “picture gallery” showroom in the top floor loft of his own townhouse in Manhattan where the formal portraits,

antlered sconces, fireplace surrounds, iron grilles, chests and chairs could be displayed for sale to his wealthy patrons.

RONALD J. ONORATO

Charles Follen McKim. Born in Isabella Furnace, Pennsylvania, 24 August 1847. Studied at Lawrence Scientific School, and Harvard University, Cambridge, Massachusetts; apprenticed to the architect Russell Sturgis; pupil, At  lier Daumet, Ecole des Beaux-Arts, Paris. Employed as a draughtsman in the office of H.H. Richardson, New York, 1870; established McKim, Mead and Bigelow firm, New York, 1878; organized McKim, Mead and White, New York City, 1879. Fellow, American Institute of Architects; Gold Medal, Royal Institute of British Architects, 1903; Gold Medal, American Institute of Architects, 1909. Died in St. James, New York, 14 September 1909.

William Rutherford Mead. Born in Brattleboro, Vermont, 1846. Studied at Amherst College, Massachusetts, BA 1867; trained in the office of Russell Sturgis, New York, where he met Charles Follen McKim. Partner, McKim, Mead and Bigelow, 1878, and McKim Mead and White, 1879. Fellow, American Institute of Architects. Died in Paris, 21 June 1928.

(William) Stanford White. Born in New York, 9 November 1853, the son of the architect Richard Grant White. Graduated from New York University, 1871. Studied painting; apprentice draughtsman, under McKim, in the office of H.H. Richardson, 1872. Married Bessie Springs Smith in 1884; son was the architect Lawrence Grant White. Partner, McKim, Mead and White, 1879; responsible for many of the interior details. Also active in independent practice as an architect and designer of furniture from late 1870s. Collaborated with Associated Artists, H. La Farge, and L.C. Tiffany. Fatally shot in New York, 5 June 1906.

Selected Works

A large collection of McKim, Mead and White's original drawings, blueprints, and correspondence is held by the New York Historical Society, New York. Additional material relating to Stanford White is in the Avery Library, Columbia University, New York, and the personal and office correspondence of Charles McKim is in the Library of Congress, Washington, DC. A full list of the firm's architectural commissions appears in Roth 1978. Examples of White's furniture are in the Wadsworth Atheneum, Hartford, Connecticut, and the Detroit Institute of Arts.

Interiors

- 1874–75 Watts Sherman House, Newport, Rhode Island (hall and library by White; building by H. H. Richardson)
- 1879–80 7th Regiment Armory, New York (Veterans' Room by White with Associated Artists)
- 1879–81 Casino, Newport, Rhode Island (building and interiors)
- 1881 Kingscote, Newport, Rhode Island (dining room by White)

Mackintosh, Charles Rennie 1868–1928

Scottish architect and designer

The work of Charles Rennie Mackintosh, in architecture and in every aspect of design relating to interiors, has always been regarded as important, but for varied and sometimes incompatible reasons. In his own life he had greater renown in Central Europe than in Great Britain, though that fame was based rather upon his interior and decorative design than upon his architecture. His first commentators tended to see him through the spectacles of a polemical “Modernism”, and looked down on his decorative genius or attributed it to the influence of his wife, Margaret Macdonald (who was a professional collaborator as well as life partner). A later approach

has described him as “one of the last and one of the greatest Victorians” and stressed his indebtedness to Pugin and Ruskin. More recent studies have tried to define him in terms of “critical regionalism” and Glasgow’s native traditions. That all these are viable indicates the richness of the work.

Trained as an apprentice with the Glasgow practices of Hutchison and of Honeyman and Keppie (from 1889), and enrolled at the Glasgow School of Art, he was perfectly placed to benefit from a powerful local building tradition, a rapidly developing formal curriculum, and access to the most up-to-date resources of capital and technology.

His first work consisted mainly of interiors and exterior features for commissions received by Honeyman and Keppie, all in Glasgow. His interior designs for the Glasgow Arts Club (1892), and features of the Glasgow Herald Building (1893–95) show signs of a highly individual style, akin to and showing knowledge of similar work in London and further afield; it can be described as “proto-art nouveau”. This is much more strongly marked in his collaborations with Herbert Macnair and the Macdonald sisters (Frances and Margaret). This group, bound by personal as well as professional links, became known as “The Four”; their graphic and decorative designs attracted national interest, and were notorious for their extreme character. Celtic, Japanese and other sources were employed to create an iconography of attenuated vegetal and female forms, a distinct character of line and an exalted, not to say outré symbolism that set them apart from their British contemporaries, but aligned them with similar developments in continental Europe.

During 1895 Mackintosh took on part responsibility for the design of the Martyr’s Public School. This rugged and practical structure, though largely determined by the municipal committee, demonstrates Mackintosh’s deep attachment to vernacular models (while containing modern hot water baths in the basement). The central atrium and stairwell contain bravura carpentry, shapely corbels and touches of colour; all themes that his later designs develop.

He also began, in collaboration with George Walton (1867–1933), the first of his many tea-room interiors (in Buchanan Street, Glasgow). These commissions, which were almost continuous throughout his Glasgow years, resulted in many striking and often original interiors where the imagery of “The Four” was extended over murals, chairs, screens, doors and all manner of decorative details. The climax of this sequence of work is the Room de Luxe of the Willow Tea Rooms, in Sauchiehall Street (1903–04). White and silver laquered wood, subtle dull pinks, purple and greens and darker points of colour are absolutely characteristic; motifs of stems, leaves, and roses formed from complex arcs comprise a naturalistic element in the decor, but designs based upon lattices and grids are also present. This repertoire of forms and colours was developed in association with Margaret Macdonald, who contributed gesso panels and other details. What is uniquely architectural and distinct to Mackintosh is the heightened awareness of space. This is at several levels – that of the whole complex of rooms and their relations to one another; that of the room itself, perfectly judged to combine a sense of enclosure with an alert self-consciousness; and that of the spaces around the table, which, enclosed by the high backs of the throne-like chairs, offer an intimacy within the modified public

Mackintosh: entrance hall, Hill House, Helensburgh, 1902

space of the room, and the circulation of the whole arrangement.

Other tea rooms designed for the same client, Kate Cranston, were of a character appropriate to the clientele; where the Room de Luxe is an expensive and feminine retreat, the Argyle Street Tea Rooms (with George Walton), extended over four floors to contain much more masculine domains, for billiards and smoking, with rugged oak furniture and dark colours.

In 1896 Mackintosh's drawings for a new Glasgow School of Art were accepted, on the insistence of the principal Francis Newberry. The completion of the first stage of this building occupied the next two years. It combined, in its overall composition, Scots vernacular, Art Nouveau and industrial functionalism with an ingenuity that has never ceased to be admired. Exterior details of ironwork and carving raise the iconography of "The Four" to full architectural scale. Internally, the simple, almost industrial plan and the rugged carpentry have stood the test of time. Of particular note are the "crossbow" roof trusses in the Museum. The services, including ducted air heating and synchronised clocks, were of the most modern. The more private or ceremonious parts of the School, however, are treated with greater delicacy.

In 1898 came Mackintosh's first design for a complete house; Windyhill at Kilmacoll outside Glasgow, built for William Davidson. Externally a fairly conventional small mansion, within it extended the subtle "white interiors" already seen in small commissions, and the attention to carpentry, to a new finesse. This manner was developed further in Hill House, Helensburgh, for the publisher Walter Blackie (1902–04) and the designs for "A House for an Art Lover" (1901) which (though unbuilt) won great acclaim in Germany and Austria. In these houses, and other buildings, we find a distinct poetic pattern, whereby the further into the private reaches of the rooms one progresses, the more extreme and innovative becomes the style; one passes from a neo-Vernacular exterior, by halls and corridors in highly articulated timber, to living and bedrooms whose sleek finishes and curved profiles embody a restrained eroticism. "Here," wrote one contemporary, "were rooms like dreams". But we note that they imply a deportment and style of behaviour that are now hard to reconstruct.

All of these interiors contain decorative panels and paintings by Margaret Macdonald, whom Mackintosh married in 1900. With her he renovated apartments at 120 Mains Street, Glasgow, and elsewhere creating the typical "white interior", in which the colour scheme is derived from an idealised nudity, and in which highly crafted and natural surfaces are treated with exquisite sensuousness. Rooms such as this have a prehistory in the Aesthetic Movement, especially in rooms by E. W. Godwin and C. F. A. Voysey; but these remain unique for their intensity and perfectionism. Hermann Muthesius in *Das Englische Haus* (1904) claimed that they "mark the way to excellence for mankind in the future".

Furniture and designs connected with the Mains Street interiors were seen, with other work from Glasgow, at major foreign exhibitions, notably the 8th Vienna Secession Exhibition (1900), and the Turin Decorative Arts Exhibition (1902), as well as the Glasgow International Exhibition (1901) where Mackintosh designed the stand for the firm of Wylie and

Lochhead, who were the principal retailers of "The Glasgow Style".

But these years are also marked by larger or more public undertakings in Glasgow, especially the *Daily Record* building in Renfield Lane (1900); also completed was Queen's Cross Church, Garscube (1899). In 1903, Mackintosh submitted drawings for a competition to design Liverpool Cathedral. What is striking about these designs is their strongly neo-Gothic character, and they provide evidence for those who argue he was essentially a 19th-century man. Quite different was a second school, in Scotland Street, Glasgow (1903–06). This building, noteworthy for its use of geometric ornament, marks the start of Mackintosh's later phase. Across the south wall of the building a huge rectilinear thistle is inscribed, like a Scots Tree of Life. The building as a whole manifests a vernacular quality ingeniously blended with Modernism; all of this is quite unlike the Cathedral designs on which he had been working simultaneously. The interior is a blend of the work-a-day and the elegant, and a marked departure from the Art Nouveau character of the work done with "The Four".

Mackintosh returned to The School of Art in 1907 to design the Library (completed 1909). While this addition appears to be in a very different style – abstract, vertical and "proto-Modernist" – it blends perfectly with the original, already mixed but unified, composition. The reading room itself is assembled from discreet, mechanically shaped timbers. The Library is the culmination of themes begun in the Martyr's Public School and continued through Windyhill and Hill House (and miniaturised in many pieces of furniture); it bears some relation to Japanese design, with which Mackintosh was well acquainted. But it also looks forward to, for example, the furniture of Gerrit Rietveld and to all the more recent "kit" constructions. Another notable feature of the Library is the design of the electric lights, whose shades mimic the exterior of the building.

Such was the variety and quantity of Mackintosh's work in the decade between 1897 and 1907 that it is a major effort of scholarship and mental organization to keep track of it. In addition to architecture and interiors, furniture of every kind and size was designed and produced. Billcliffe (1986) has identified over 400 distinct designs. To this must be added designs for cutlery, light-fittings, textiles, fire-irons, carpets, kitchen equipment and anything else required. This fertility was made possible by a level and method of graphic invention that enabled the transfer of ideas from one scale and medium to another, with unexampled ease. There is, in effect, no clear distinction between interior design as such, and architectural and other design, because the linear flow blends one realm with another, without loss of continuity. Mackintosh achieved that synthesis between all the elements of design, at which Art Nouveau had always aimed.

After 1909 Mackintosh's career went into decline, for many reasons. By 1914, cut off from his many Continental connections, he moved to Walberswick in Suffolk and later to Chelsea. In 1915 he received his last substantial commission, to remodel a small terrace house in Northampton, 78 Derngate, for W. Bassett-Lowke. This final design takes up the geometric motifs explored in Scotland Street School and the Library (but always present in his work), and builds the entire interior around them.

The entrance hall of Bassett-Lowke's house, in velvet black with stripes and patches of bright colour, is much too dynamic to fit easily into classifications such as Art Deco. It is closer in spirit to Vorticist painting, and its coloration is that of the Ballets Russes. The bedroom of this house, now preserved in the Hunterian Museum, is decorated with a optical display of blue stripes and pale beechwood furniture; the living room fireplace is reminiscent of the stonework of the Library. This is an extraordinary set of rooms, demonstrating once again principles of decorative unity and spatial organization.

There were no further substantial commissions, and although more furniture and several striking textiles were designed, the rest of Mackintosh's career was spent as a painter in the South of France.

Biography

Born in Glasgow, 7 June 1868. Articled to the architect John Hutchison (c.1841–1908), from 1884; enrolled in painting and drawing courses, Glasgow School of Art, 1884, 1888. Married the painter and decorative artist, Margaret Macdonald (1865–1933), 1900. Joined the firm of Honeyman and Keppie, 1888; partner, 1904; private practice, 1913. Active as an architect and designer of furniture and interiors from the mid-1890s; collaborated with Herbert MacNair and Frances and Margaret Macdonald, "The Four", 1890s; collaborated with George Walton on Glasgow Tea Rooms, 1896–97. Few architectural commissions after 1909; from 1914 worked mainly as a textile and graphic designer, and from 1923 as a painter of watercolours. Participated in several international exhibitions and competitions, including the Arts and Crafts Exhibition, London, 1896; Secession Exhibition, Vienna, 1900, and International Exhibition of Modern Decorative Art, Turin, 1902. Left Glasgow, 1914; settled in London, 1916; moved to Port Vendres, France, 1923. Died in London, 10 December 1928.

Selected Works

A collection of over 600 drawings and designs, more than 60 pieces of furniture, and reconstructed interiors from 120 Mains Street and 78 Derngate, are owned by the Hunterian Museum and Art Gallery, University of Glasgow. Additional important collections of drawings and designs are in the Glasgow School of Art which also includes much of the original furniture and fittings. Furnishings from the Ingram Street Tea Rooms are in the Glasgow Art Galleries, Glasgow. The University of Glasgow and the Glasgow School of Art also own work by Margaret Macdonald

Interiors

- 1895 Martyr's Public School, Parson Street, Glasgow (interiors including the stairwell and atrium; with Honeyman and Keppie)
- 1896 Tea Rooms, 91–93 Buchanan Street, Glasgow (mural decoration; furnishings by George Walton): Kate Cranston
- 1896–99 Glasgow School of Art (eastern section; building, interiors & furnishings: redesign of western section, including Board Room, Library and Ladies' Common Room, 1907–09)
- 1897–98 Tea Rooms, 114 Argyle Street, Glasgow (furniture; decorations by George Walton: decoration and furniture for Dutch Kitchen, 1906): Kate Cranston
- 1898–1900 Westdel, Queen's Place, Glasgow (interiors)
- 1899–07 Windyhill, Kilmacolm, Strathclyde (building, interiors and furniture): William Davidson
- 1900 120 Mains Street, Glasgow (decorations and furniture): C.R. and M. Mackintosh

- 1901 "House for an Art Lover" (competition designs for a bedroom and music / reception room published in *Zeitschrift für Innen-Dekoration*, Vienna): Alexander Koch
- 1901, 1907 & 1909–11 Tea Rooms, Ingram Street, Glasgow (White Dining Room; furnishings and decorations including gesso panels by Margaret Macdonald; decorations and furniture for Oak Room, 1907: decorations and furnishings for Oval Room, Ladies' Rest Room, Chinese Room and Cloister Room, 1909–11): Kate Cranston
- 1902 Scottish Section, International Exhibition of Modern Decorative Art, Turin (with Margaret Macdonald; furniture and decorations)
- 1902 Wärndorfer Music Salon, Vienna (furniture and decoration; gesso panels by Margaret Macdonald): Fritz Wärndorfer
- 1902–04 Hill House, Helensburgh (building, interiors and furnishings): Walter W. Blackie
- 1903 & 1917 Willow Tea Rooms, 199 Sauchiehall Street, Glasgow (furnishings and decorations including the Room de Luxe, Front Saloon and Back Saloon: decoration and furniture for the Dug Out, 1917): Kate Cranston
- 1916–19 78 Derngate, Northampton (remodelling, interiors and furniture): W. J. Bassett-Lowke

Designed furniture for Messrs. Guthrie & Wells, Glasgow; textiles for Foxton's & Sefton's, London.

Mackmurdo, Arthur Heygate 1851–1942

British architect, designer and theorist

Co-founder of the Century Guild, one of the first of the Arts and Crafts Guilds, and co-editor of the *Hobby Horse*, A.H. Mackmurdo emerged as one of the most original and creative figures of his generation. He anticipated and influenced the work of C.F.A. Voysey, H.M. Baillie Scott and the Glasgow Four among others, and justifiably gained international acknowledgment for the significant and formative role that he played in the genesis of the Arts and Crafts Movement, Art Nouveau and the Private Press Movement.

From a prosperous and well-connected family, Mackmurdo came into early contact with leading figures of the artistic and intellectual spheres including Carlyle, Ruskin, Whistler, the philosopher Herbert Spencer and William Morris. Mackmurdo was trained as an architect, and his early work in that field developed rapidly during the 1870s into a quite distinctively personal style, the complexity and ingenuity of which was informed by his growing awareness of Northern Italian work and his later appreciation of the architecture of Christopher Wren. This is most effectively shown by a comparison of Halcyon House, c.1873 and the later Brooklyn, both in Private Road, Enfield. The remarkably advanced composition of the latter has led to its proposal as a pioneer of the Modern

Movement. However, its sparing classical details evoke faint reminiscences of the Northern Renaissance and perhaps reflect the influence of Herbert Percy Horne (1864–1916), Mackmurdo's partner and collaborator from 1883 until 1890.

Mackmurdo's design work was no less innovative or influential. He appreciated the arts and crafts both for their intrinsic beauty and for their social importance as a means by which craftsmen would regain their individuality and dignity. Believing in the essential unity and interdependence of the arts he exhorted designers to consider the total environment, laying particular emphasis on the inter-relationship between different areas of domestic interior design. Described as an "organic thinker" (Stansky, 1985), he felt that life should itself be integrated, and this conviction underlay his ideas on city planning and informed his later social thinking and publications.

In 1882 Mackmurdo founded the Century Guild with Selwyn Image and Herbert Horne. The Guild aimed, in its own words, "to render all branches the sphere no longer of tradesmen but of the artist" and "to restore building, decoration, glass painting, pottery, wood carving and metal to their rightful places beside painting and sculpture". Inspired in theory by Ruskin and in its practice by William Morris, the Guild was a loosely allied group of designers which undertook commissions for completed buildings or for furnishings and decorated rooms. They were united in their shared concern to sustain the highest qualities of design and execution in both handcrafted and manufactured goods and were more realistic in their approach to the machine than many other Arts and Crafts organisations. Mackmurdo was active in the National Association for the Advancement of Art in Industry and promoted a more co-operative and socially acceptable relationship with manufacturers.

There was no common workshop, but designers collaborated in producing stained glass, decorative metalwork, moulded plasterwork and painted decoration, textiles, picture frames, wallpapers and furniture. The Guild acted as an agency for craftspeople, promoting individuals such as Rhoda and Agnes Garrett (furniture and decoration), De Morgan (ceramics), Powell's (glassware) and Charles Rowley (picture frames) and firms such as Morris and Company, the Chiswick Press and Royal School of Needlework. Other art-workers worked through the Guild itself – Herbert Horne designed many of their textiles, Mackmurdo the furniture and Benjamin Creswick the sculptural decoration, while Selwyn Image was often called on for stained glass and Harold Rathbone, Clement Heaton, and Kellock Brown for decorative metal work. Nevertheless, Mackmurdo's espousal of group activity and individualism allowed the Guild to present their work in a co-operative way, and it was not always possible to tell who exactly had produced what, although a shared style did emerge.

The Guild made a great collective impact at a series of major exhibitions in the 1880s, starting with the International Inventions Exhibition in London in 1885. The *Building News* of that year, considered their stand to be "vigorous and fresh, and is what it aims at being – quite of this century". Mackmurdo and the Guild were well represented at the International Navigation and Trades Exhibition held in Liverpool in 1886. Their stand was painted bright yellow, with brown-stencilled flower motifs to set off the rich dark colours

of the furniture and fittings. It was distinguished by distinctive, slender, closely spaced columns capped by a series of wafer thin squares, one of Mackmurdo's hallmarks and one which anticipated the work of C.F.A. Voysey and Charles Rennie Mackintosh. Mackmurdo's stand for Cope Brothers, the tobacco firm, was similar in design. The interior of his smokers' pavilion was noteworthy for its exposed and unrelieved timbers. The Guild's dining room had a lightness and a unity of touch departing from contemporary show furnishings which tended towards darkened oak in an Elizabethan or Jacobean style, with heavy upholstery and hangings. It demonstrated the Guild's concern for unity of effect and aesthetic delicacy, succeeding in balancing colour, form, structure and decoration and integrating sculpture and painting, fine textiles and ceramics.

The Guild's work at Pownall Hall, Cheshire (1886), for the brewer Henry Boddington, is particularly important as it was their only known substantial commission. The rooms exemplify the Guild's ideal of re-uniting the arts, although the contents are drawn from different artists. The tall, oblong dining room was fitted and furnished with the contents of the Guild's Liverpool Exhibition stand, notably the rather ponderous dark mahogany buffet, and the livelier chimneypiece with Creswick's gilded figures. The loose furniture was rather delicate and reminiscent of Hepplewhite and Sheraton, a typically English style advanced by the Guild in the 1880s, although it did not find favour with the Arts and Crafts followers until the 1890s. The armchair and dinner wagon illustrated a version of the cabriole leg, and the corniced panel rising from the chair-back was an example of the Guild's idiosyncratic interpretation of classicism. The predominantly yellow drawing room was closer in mood and colouring to the delicate aestheticism of Whistler and Godwin. Throughout the house, chandeliers, sconces and various pieces of metalwork display the motifs which have come to characterise the Guild. The Entrance Hall, exhibited by the Guild at the Manchester Jubilee Exhibition in 1887, was based on their work at Pownall Hall.

The Guild's most important design contributions were undoubtedly made by Mackmurdo himself. His style is exemplified in his furniture, using flowing natural forms in its carved and inlaid decoration and upholstery fabrics. Nature was Mackmurdo's source; flowers, leaves and birds predominate. His palette of yellow ochres, coral pinks, purples and acid greens distinguishes him from Morris. The keynote in both furniture and architecture is the ubiquitous mannered pillar, stretched to a slender vertical elegance and forming an essentially grid framework; functional and yet clearly linked to the Aesthetic Movement. Within that frame, the decorative patterns billow and sway, allowing the relief of severe designs by means of vivid natural ornament. There is also an acute sense of proportion which is unmistakably insistent throughout each of his designs. Mackmurdo also valued architectural severity of line in all structural features, whether it be in metalwork or in wood furniture. It is evident in designs for various objects such as lamps, sconces, mirror frames, writing tables, lampfittings and even in fireplaces.

The conjunction of different impulses from architecture, design and social thinking invest Mackmurdo's work with its

fascinating complexity, and accounts for his importance for late 19th century interior design.

HILARY J. GRAINGER

Biography

Born in London, 12 December 1851. Apprenticed to the architect Chatfield Clark, 1869; attended John Ruskin's drawing classes, Oxford. Married his cousin Eliza D'Oyly Carte in 1902. Employed as an Improver by James Brooks, 1873. Visited Italy with Ruskin, 1874; travelled to Italy again, 1875–76. Established independent architectural practice, London, 1874; active in London and Manchester from 1890; joined the architectural practice of Latham Withall, 1896; retired from his London practice, 1906. Designed furniture and interiors from the 1880s; co-founder with Herbert Percy Horne (1864–1916) of the furniture and interior design co-operative, the Century Guild, 1882 (dissolved 1890); involved in typography and graphics from 1883. Moved to Essex, 1902. Published numerous works on design and society including articles in the *Hobby Horse* (founded 1884), the journal of the Century Guild; his later years were largely devoted to developing ideas for socio-economic reform. Died in Essex, 15 March 1942.

Selected Works

A collection of furniture, wallpapers, textiles and designs by Mackmurdo and the Century Guild is in the William Morris Gallery, Walthamstow, which also includes Mackmurdo's unpublished manuscripts for his *Memoirs* and *History of the Arts and Crafts Movement*. Examples of drawings, watercolours, lamps, metalwork and furniture by Mackmurdo are in the collection of the Colchester and Essex Museums, Colchester. Additional examples of wallpapers and wall decorations are in the Victoria and Albert Museum, London. For a list of Mackmurdo's architectural works see Pevsner 1968.

McMillen Inc.

American interior decorating firm; established 1924

Founded in New York by Eleanor McMillen Brown (1890-1991), McMillen Inc., is often cited as the first professional full-service interior decorating firm in America. The company has worked in every design vernacular during its existence, but is best-known for formal rooms painted in light colors and decorated with antique furniture, panelling and fabrics.

Born in St. Louis, Missouri, Eleanor trained in interior decoration at the New York School of Fine and Applied Arts (later renamed the Parsons School of Design). At the end of her third year of study, she attended the school's Parisian branch, under the direction of William Odom (1886-1942). Odom guided his students through the great houses and museums of France and Italy to insure that they had a solid background in art history.

McMillen's first professional commission was the design of a modern Portuguese interior for the American embassy in Rio de Janeiro. In 1924, she returned to New York, where the well-known decorator Elsie Cobb Wilson invited McMillen to join her business. It was not long before William Odom, who was also working with Wilson, suggested to McMillen that she establish her own interior design office selling antiques chosen by him in Europe.

Most of McMillen's clients at her townhouse at 148 East 57th Street were from the high social circles in which she travelled. She chose the name McMillen Inc. to indicate that she and company intended to uphold professional standards. McMillen established the firm's style in these early years; interiors showed a lightness and modernity as rooms incorporated compatible objects from different periods and styles with pale wall colors and fabrics. McMillen's personal taste was tradi-

tional and classical; she preferred Neo-Classical French and English late 18th and early 19th century styles.

The most distinctive characteristic of McMillen's work, and what set it apart from that of other decorators, was the firm's facility and expertise in interior architecture. Grace Fakes, a former teacher at the New York School of Fine and Applied Arts, joined McMillen in 1926. Fakes, an expert on historic woodwork and floor plans from every period, oversaw the architectural work undertaken by the firm. McMillen believed that it was not necessary for the architecture of the room to be of the same period as the furnishings as long as it was restrained, elegant and set them off to advantage. McMillen's showrooms displayed antique furniture and decorative objects within room-like settings, allowing clients to envision complete and harmonious interiors.

McMillen's taste was more severe than her contemporaries, and her use of pattern more restrained. She believed that the walls of public rooms should be painted in tranquil colors, relieved only by pilasters and niches. Walls were only wallpapered in bathrooms, dining rooms, and occasionally bedrooms, and flowered chintzes were used only in country houses. McMillen did not disapprove of the new styles, yet she hesitated to incorporate them into her designs. Early work included interiors for Colonel H.H. Rogers, his daughter, Millicent Rogers, and Mr. and Mrs. Henry Parish II.

To survive the economic hardship of the Depression, McMillen dipped into the firm's capital, and to keep the staff busy, Fakes designed a travelling exhibition of miniature rooms. These nine rooms, which were first exhibited in the McMillen showrooms in 1932, were furnished down to the smallest detail. Noted contemporary artists made tiny examples of their work to decorate the rooms, while the staff at McMillen made miniature marble floors, fireplaces, furniture, Aubusson rugs, crystal chandeliers, tea services and magazines. According to McMillen, these rooms were "modern interpretations of the classic and stress the importance of proportion and composition. They are not intended to be radical in any respect." The rooms, comprising a large New York apartment, were so popular that at the end of 1932 they travelled to several cities in the United States and Canada, benefiting unemployment relief charities.

After the Depression, the company took on its first contract work: the decoration of the Cosmopolitan Club in New York in 1933 and the redesign of the Steuben Glass showroom, New York, in 1934. The same year, Eleanor McMillen married the New York architect, Archibald Brown. Throughout the 1930s she taught at Parsons and travelled to Europe on buying trips. To promote the business, McMillen had several fine and decorative arts exhibitions and wrote articles for decorating magazines on historical styles as well as future trends in interior decoration.

In 1940, McMillen opened a branch of its offices in Houston, Texas, where the company had been particularly successful. The Houston showrooms, at 2503 Westheimer Road, displayed not only furnishings but also art exhibitions from the New York galleries Wildenstein and Knoedler. World War II eventually forced the closure of the Houston office in 1943, as shipping became increasingly difficult.

Although after the war many Americans moved toward a less formal style of living, McMillen's clients continued to seek

out the firm's historically accurate and traditional interiors. The company consolidated its reputation as the decorator to socially prominent and stylistically conservative Americans. These clients chose McMillen for the staff's expertise in a wide variety of styles and periods. Clients from this period included Millicent Rogers, Marjorie Merriweather Post, and Mr. and Mrs. William Paley. Two of the most important commissions from this period were the restoration of Rosedown, a plantation house in St. Francisville, Louisiana, dating from 1835, and the decoration of Mr. and Mrs. Henry Ford II's residence in Grosse Point, Michigan.

Although McMillen was primarily interested in interior decoration using historical styles, during the early 1950s, she was impressed by objects made by young French designers. In 1952, under the direction of Betty Sherrill, McMillen exhibited two floors of complete room interiors furnished with work by 26 contemporary French designers, craftsmen and artists.

During the 1960s, as bolder prints and stronger colors started to predominate within American interiors, McMillen continued to produce classical rooms, but incorporating brighter colors. Although the firm was not designing the most avant-garde interiors, decorating magazines such as *House and Garden* continued to promote the company's work. McMillen joined Sister Parish, Billy Baldwin and Dorothy Draper as the established and conservative forces in American interior design during the 1960s and 1970s, a position the firm still holds today.

During the early 1960s, under the John F. Kennedy administration, the firm received the commission to decorate several rooms in Blair House, the United States' official guest house for visiting dignitaries in Washington, DC. Later, McMillen decorated President Johnson's family's private quarters in the White House. Also during the 1960s, the firm established a formal contract department to generate work from banks, clubs, hotels and other businesses. By the 1980s, half of the McMillen's business was for corporations.

Over the years, McMillen employed and trained many noted decorators, including Natalie Davenport, Albert Hadley and Mark Hampton. In 1976, the company was restructured: McMillen became chairman, although she continued to work daily into her nineties, and Betty Sherrill, who had joined the firm in 1951, became president. In 1978, after 56 years, the company moved its offices to 155 East 56th Street. McMillen died in 1991, leaving a legacy of classically trained decorators working to design elegant, light and comfortable interiors.

Magazines and Journals

As with most serial literature, magazines and journals on interior design and decoration allow rapid coverage of developments in the field. More than published books and decorating manuals, magazines identify and champion popular trends and tastes; they are usually very contemporary in their approach to subject matter. By the mid-20th century magazines fell into three categories: professional and trade titles; scholarly journals; and popular, home or general interest periodicals. Most magazines on interior design are overwhelmingly visual in their presentation. Content is usually descriptive rather than evaluative, except for articles in scholarly journals.

Magazines on interior design and decoration were well established by the mid-19th century. The British, who produced numerous books and manuals on decorating, also issued various periodicals on aspects of the subject. Topics relevant to design reform and interior decoration and furnishings were critically covered in the *Journal of Design and Manufactures* (UK, 1849–52). This serial publication was an influential by-product of the London Great Exhibition of 1851; its tone was didactic and it included articles by several leading designers and theorists including Richard Redgrave, Henry Cole and Owen Jones. The *Journal of Decorative Art* (UK, 1881–1937) was a longer-running successor that provided artistic and commercial evaluation of the applied arts. Other specialist journals reviewed developments within architecture and the furniture trade. *The Builder* (1842–) carried regular features on the work of popular architects and contributed to contemporary debates on style, and the *Cabinet-Maker and Art Furnisher* (1880–1905) featured discussions of room treatments as well as text and illustrations relating to recent furniture designs. Magazines that championed avant-garde styles included *The Studio* (London, founded 1893) and *Art et Décoration* (France, 1898–1914) and *Dekorative Kunst* (Germany, 1897–1914). *The Studio* was the mouthpiece of the international Arts and Crafts Movement while its European counterparts also took up the cause of Art Nouveau and Secessionist design. While many of these journals were aimed primarily at a professional readership, individual issues offer a vivid insight into interior decoration tastes of the times.

The American market for magazines on interior furnishing also developed in the 19th century. They aimed for mass market appeal and instruction in home decoration tips, as seen in the *The Art Amateur* (US, 1879–1914), and the still in-print *Ladies Home Journal* (US, 1883–). *House and Garden: The Magazine of Creative Living*, which has been in print continuously since 1901, is particularly valuable for its documentation of the most current trends in interior design throughout the century.

Once the interior decoration profession was established by the last quarter of the 19th century, serial publications served as communication tools. As the industry prospered and grew, magazines were created to promote, advertise and educate

those in the profession. Emphasis is on current, notable designers and firms rather than thematic articles. *Interiors: For the Contract Design Professional* [formerly *Contract Interiors*] (US, 1888–) is one of the earliest continuing professional and trade periodicals. Important installations or restorations of interiors, commercial and residential, are regularly profiled in photos and text. *Interior Design* (US, 1932–) is still a major resource for professionals in its broad examination of all types of installations, and its ability to forecast trends in interior looks. *FDM: Furniture Design and Manufacturing* [formerly *Furniture Design*] (US, 1959–) is meant for the professional woodworking industry; features examine relevant technical, manufacturing and marketing issues. *Contract: The Business Magazine of Commercial Furnishings, Interior Design, and Architecture* (US, 1960–) is specifically designed for the top end of the trade market. As its title indicates, all aspects of the business, including financial details, are regularly featured. *Decorating Retailer* (US, 1964–) is another title with a specific readership. Glossy magazines such as *The World of Interiors* (UK, 1981–) and *Elle Decoration* (UK, 1990–) appeal to both professionals and general readers and contain numerous articles on fashionable interiors as well as information on particular designers and decorating trends. *Interiors* has more of a historical bias and has been particularly instrumental in promoting a taste for period revivals and the English Country House look, while *Elle Decoration* concentrates on modern trends.

Scholarly periodicals provide information meant for professionals, historians, students and informed laypersons. *ID (International Design): Magazine of International Design* (US, 1954–) covers all product design, with profiles on designers and innovative products. *Abitare* (Italy, 1960–) and *Ottagono: Design, Art, Architecture* (Italy, 1966–) document the importance of modern Italian interior design contributions. In America, *Design Quarterly* (US, 1954–) and *Journal of Interior Design Education and Research* (US, 1976–) are examples of the post-World War II growth of educational training in the field. *Design Studies* (UK, 1979–) is a British equivalent with evaluative articles on interior design topics, and was followed by *The Journal of Design History* (UK, 1988–), which provides footnoted articles on historical issues in all areas of material culture, including key interior styles, individuals and furnishings. The scholarly content of these publications has been supplemented by specialist journals on the decorative arts. The *Connoisseur* (UK) and *Magazine Antiques* (US) both include information on the history of furnishings and interiors aimed at historians and the antiques trade while more recently, academic journals such as the *Winterthur Portfolio* (US) have fore-fronted new approaches and research on many aspects of the decorative arts and design. *Interior Design China / Shih Nei She Chi* (Hong Kong, 1987–) is only one example of a beginning interest in national and regional focus interiors. Researchers seeking articles on interior design will find author and subject access in the following periodical indexes: *Art Index*; *Art Bibliographies Modern*; *Avery Index to Architectural Periodicals*; *Design and Applied Arts Index*.

Popular magazines offering practical advice or inspiration to the general reader have flourished since the mid-19th century. During the 1860s, the British design reformer, Charles Eastlake, contributed regularly to journals like the *London*

Review and *Queen*, and the late 19th century witnessed a positive burgeoning of articles on home decoration in magazines such as the *Lady's World* and *Harper's New Monthly Magazine*. In recent years, publications of this kind are usually highly visual presentations. *House Beautiful* (US, 1896–), a long-running title, is particularly popular for its photographic spreads of attractive interiors. *Country Life* (UK, 1897–), which commenced in the wake of the preservation movement, while retaining its chiefly British focus, contains well-written articles and features on important aspects of interior design. *Better Homes and Gardens: The Magazine for American Families* (US, 1922–) is intended for a middle-class American readership and offers how-to features on building, remodeling and decorating, among other domestic topics; its British equivalents are *House and Garden* and its rival *Homes and Gardens*. Another American magazine, *1,001 Home Ideas* (US, 1940–) belongs to the do-it-yourself tradition. The emphasis is on home improvement and covers new trends and products. These magazines are important venues for viewing more mainstream types of interior design and decoration. A venerable title that crosses between professional and popular interests, *Architectural Digest* (US, 1925–) has gone through various transformations; since the 1980s, it has become a glossy, stylish trendsetter, with a heavy emphasis on photographic essay profiles of celebrity residences.

More avant-garde coverage is offered in several magazines that overlap interior design and visual arts concerns. For example, *Antiques* (US, 1992–) is a cross-over title that, while very popular and glossy in format, contains articles of scholarly quality. *Casabella: International Architectural Review* (Italy, 1928–) and *Domus: Monthly Review of Architecture, Interiors, Design, Art* (Italy, 1928–) explore the relationships between architecture and interior design. Both magazines have done much to promote the radical elements of modern Italian design on the international stage: *Casabella* was edited by Alessandro Mendini (1970–76) and *Domus*, was founded and later edited by Gio Ponti. In the last 25 years, the market for specialized periodicals on interior design styles and types has boomed. Representative of these new publications are popular titles with attractive photographic layouts and style profiles such as *Metropolitan Home* (US, 1969–). And with the growing interest in revivalist styles the market for magazines with a period focus has also increased: *Colonial Homes* (US, 1974–); *Victorian Homes* (US, 1982–); and *Traditional Homes* (UK, 1984–90). The fashionable aspect of interior decoration can be seen in spin-offs like *Vogue Decoration* that is published in several languages throughout the world.

Maiolica

The term "maiolica" is the name given to a type of tin-glazed pottery principally made in Italy from the early 14th century. Tin-glazed earthenware was also produced in other countries where it is called *faience* (France) and *Delftware* (Holland and England). The technique was introduced into Italy from Moorish Spain by way of the island of Majorca (or Maiolica), from where it derived the name by which it came to be known in Italy. The main centres of production were: Faenza, Deruta, Urbino, Orvieto, Gubbio, Florence and Sarvona.

Most maiolica involved glazing a fired piece of pottery in a white glaze made with the addition of tin-oxide, on to which colours were then painted. These were then fused on by a second firing. The palette of the maiolica painter was generally restricted to five colours: cobalt blue, antimony yellow, iron red, copper green and manganese purple; the blue and purple were used, at various periods, mainly for outline.

The forms of maiolica are few and comparatively simple. The white glaze provided an open invitation for pattern and imagery, and the very separateness of the thick glaze surface from the underlying body predisposed a dominant concern with surface. For the most part the forms were dictated by the need for a surface on which the painter could exercise his skill. This has given rise to the criticism most often levied against this type of pottery that the forms are nearly always subordinate to the surface decoration and little effort was made to integrate these two components of the object. The strict division of labour in the fine arts in Renaissance Italy which meant that in the production of maiolica a hierarchical distinction quickly formed between content (the painting) and form (the pottery body), perhaps helps to explain this emphasis.

The most common form made in Italian maiolica was probably the *albarello*, or drug jar. These gaily coloured jars were a fashionable decoration for pharmacies, displayed in large sets along specially designed shelves. The albarello shape, copied from Spain, was used for dry drugs and a spouted variety was created for wet drugs. Another popular and distinctive form was a type of pear-shaped pedestal jug (the *panata*), with a large thrown and applied lip. The most notable form of Italian maiolica, however, was the *piatta da pompa*, or show dish, that uses the pottery body solely as a support for a purely pictorial effect. Not surprisingly, these dishes form the greater part of surviving wares because, since they were expensive, special pieces, intended for display rather than general use at the table or in the kitchen, they have been carefully preserved. They are generally painted on only on one side, intended to be viewed from the front like paintings, and were displayed on sideboards and buffets in prominent positions as focal points in the decorative schemes of domestic interiors.

From about the 15th century some maiolica potters made tiles and architectural ceramics, such as wall roundels, tile panels and pavements to enhance interiors. The Florentine workshop of Luca Della Robbia, for example, made glazed terracotta reliefs: lunettes, roundels, armorial medallions, free-standing figures and busts, for interior schemes in conjunction with a number of architects. The first appearance of ceramics in Della Robbia's work is in the Pertola (1441) in the form of polychrome glazed garlands of fruit and flowers, white glazed cherub heads and blue glazed background.

The whiteness of the maiolica glaze was held in high regard for its resemblance to Chinese porcelain which had initially inspired the production of tin-glaze pottery. The white glaze suggested notions of purity, refinement, status and expense. Its ability to maximise colour in a luminous fusion of glaze and pigment presented a marked contrast to the earthy utilitarian pottery common throughout Europe in medieval times.

Maiolica was considerably more costly than common lead-glazed slipwares due to the large amount of highly skilled labour required and the relatively expensive materials and processes involved, which meant that this type of pottery was usually only affordable by the middle classes, and large institutions such as hostels and monasteries. Some important families, such as the Medici family in Tuscany, patronised certain potters, and had their personal monograms incorporated within the painted designs on the pottery they commissioned.

The first examples of Italian maiolica exhibit a strong influence of Near Eastern pottery, which had inspired it, but it soon developed its own styles, subjects and methods of production, with many regional variations. The earliest maiolica, beginning in the 13th century, is decorated in green and manganese purple, in imitation of Spanish *Paterna* ware. The most important centre at this date was Orvieto, in Umbria, where the characteristic maiolica jug, with a disproportionately large pouring lip, was first produced. Similar productions started soon after at Florence and Siena. The decorative motifs most commonly used were masks, animals of various kinds, and foliage in a Gothic style of ornament. Early in the 15th century maiolica potters in Florence developed a series of wares painted in a distinctively dark, thick blue. These, too, are in a Gothic style which, from about 1450, made particular use of oak-leaves and heraldic animals.

From the late 15th century, with the development of the Italian Renaissance, classical motifs, imagery and conventions started to be used by maiolica painters, and the Gothic style declined. The *istoriato* (or narrative) style of maiolica was the most notable manifestation of this period, developed first in Faenza from the 1520s, and then in other centres soon afterwards. During the Renaissance the fine art of painting came to be held in the highest regard, while the crafts, such as pottery, were given a low status as a purely manual task. Ceramic painters were keen to dissociate themselves from craftsmen, and pictorial considerations began to take precedence over those of form and function. Consequently, the pots became mere vehicles for decoration. The *istoriato* period is characterised by elaborate showpieces in the form of large flat dishes, often decorated across the whole of the surface, individually produced and usually signed by the artist. Many of the *istoriato* painters were well-known fine artists, such as Nicola da

Urbino and Francesco Xanto Avelli. The imagery they used was usually taken from a respected source, such as the Bible, classical mythology or legend, or copied from prints by or after well-known artists such as Raphael, Dürer or Mantegna. Technically and artistically maiolica reached its most sophisticated during this period, but the style quickly declined in the latter half of the 16th century, as High Renaissance conventions declined in favour of Mannerism, and the designs became increasingly mass produced and conventionalised.

Maiolica has continued to be produced, though in less elaborate and in decreasing quantities, up to the present day, particularly at Faenza and several other centres in Northern and Central Italy.

From Italy the fashion for tin-glaze spread throughout Europe. In the early 1500s Italian potters, with an eye to new and developing markets, started to emigrate and set up workshops initially in Spain and Antwerp, and later Switzerland. From Antwerp the technique travelled to Holland, to Germany and then to England. From Switzerland, it was to move eastwards to Austria, Bohemia, Moravia, Slovakia and Hungary.

La Maison Moderne

French furnishings retail outlet, 1899–1903

In September 1899, when Julius Meier-Graefe (1867–1935), a German-Hungarian expatriate and supporter of design reform, surrendered his position at *Decorative Kunst / L'Art Décoratif* he did so to become the director of a new store in Paris – at 82 Rue de Petits Champs and 2 Rue de la Paix – that was symbolically named for what it was to represent: La Maison Moderne. Objects exhibited in the store's extremely modish interior made Meier-Graefe one of the day's most adventurous entrepreneurs of the applied arts, rivalling Siegfried Bing (his close friend and confidant) who had spurred design reform in France from the moment he opened his first Salon of Art Nouveau in December 1895.

Meier-Graefe envisioned the creation of an active association of artists for solely commercial purposes, and based his plan on precedents he had observed in Belgium with La Maison d'Art (1894–1900), in Austria and among various members of the Munich Werkstätten. He emphasized the exhibition, selling, and distribution of works produced by commissioned designers. He would promote their objects through display in his shop and through a very energetic advertising campaign aimed at wealthy consumers. As a result, ceramics, furniture and jewellery were acquired by chic collectors.

His extensive plans were funded by a substantial inheritance he had received on the death in 1899 of his father, a magnate in industry and mining. Among Meier-Graefe's ideas was the establishment of branch stores in other key cities on the Continent, including Budapest, locations where he hoped to reach the same type of clientele as in Paris. In fact, La Maison Moderne in Budapest became a centre of artistic activity, attracting the same group as in Paris, with Henry van de Velde providing the inspiration for interior design that was produced by Hungarian artists and architects working very closely with Frigyes Spiegel – a friend of Meier-Graefe's.

According to the original plan, Meier-Graefe was to function as the producer of a given piece – a ceramic, a chair, etc. Hence individual works would bear both the mark of the independent designer and the trademark (or stamp) of the association (or shop) that sold the object. Not only did designers provide Meier-Graefe with original drawings (he retained the right of rejection since his money was funding production), but they also oversaw the creation of pieces and received a royalty on every example actually sold.

In general, in opening and decorating the interior and exterior of his Parisian shop, Meier-Graefe chose to emphasise the domestic environment in his vision of the burgeoning design reform movement. By decorating La Maison Moderne to reflect new design concepts, he hoped to generate enough interest among the public and the daily press to lure potential customers. Meier-Graefe anticipated that he could revolution-

ize the aesthetic taste of the contemporary modern consumer, who would want objects that harmonized with one another and reinforced the contemporary vision of unified design.

The primary designer for the Paris store's interior was the Belgian architect and designer Henry van de Velde who had already worked closely with Bing. Meier-Graefe realized that van de Velde represented the best of the new design concepts that were originating outside France and that he had already achieved harmonious effects in interior design. With the interior of La Maison Moderne van de Velde demonstrated that line was structure and that ornament could be achieved through a freely developed, moving linear pattern. This principle was employed in the way van de Velde designed the cabinets and vitrines so that many of the smaller pieces created by the craftsmen working for Meier-Graefe could be seen and appreciated in an environment that enhanced their aesthetic qualities. The effects of soft lighting in the interior enriched the subtle colours on fabrics and ceramics produced by firms such as Bing & Grøndahl in Denmark or Max Laeuger from Germany. In Budapest, at the second Maison Moderne, a similar interest in abstract patterning created a swirling pattern on the walls and in the furniture that caught an observer's interest in new environments.

La Maison Moderne was an inventive way to bring artists and the public together in the creation of one-of-a-kind pieces for home interiors and fashion. Meier-Graefe, and his international artisans and designers, avoided the degrading effects that were implied by mass-production techniques appropriate to a factory. Despite an extremely far-reaching and effective advertising campaign (including advertisements in magazines such as *L'Art Décoratif* and the wide availability of posters designed by Manuel Orazi and Maurice Biais) individual purchases in France were few. Directors of applied arts museums – especially in Germany, Austria, and Scandinavia – who were eager to obtain pieces as models for students often formed the clientele. Although Meier-Graefe received a major award at the first International Exhibition of Modern Decorative Design in Turin (1902) he was forced to close La Maison Moderne in Paris in 1903; the shop in Budapest continued to sell design pieces into the 1910s.

The major achievements of La Maison Moderne were three: first, along with Siegfried Bing, Meier-Graefe emerged as the principal tastemaker and promoter of the applied arts internationally. Second, his artists were among the most progressive on the Continent, and Orazi, Paul Follot and Abel Landry did much to demonstrate that designed environments were as significant as buildings. Third, and most significantly, Meier-Graefe demonstrated that there was a way to professionalize and market the applied arts, providing a glimpse of the way in which theory and design could work cohesively when supported by an enlightened patron of the arts.

Mallet-Stevens, Robert 1886–1945

French architect and designer of interiors, furniture and film sets

Robert Mallet-Stevens played an important role in the development of modern French architecture and design during the inter-war years. At a time when wealthy Parisian taste favoured the luxurious and highly decorative effects characteristic of the Art Deco style, he introduced new concepts of simplicity and functionalism and championed the work of the International Style. In describing the evolution of a new architectural style he declared, "Each time that an art is born it is at first simple, then little by little it is decorated, overloaded until it succumbs, literally crushed by ornamentation". His own work was devoid of superfluous ornament and his particular brand of Modernism evolved from his experimentation with pure, unadorned geometric volumes, and his interest in materials of the machine age.

Born in Paris in 1886 into a wealthy and artistic family, Mallet-Stevens studied architecture at the École Spéciale d'Architecture between 1905 and 1910. During this period, his uncle, Adolphe Stoclet, commissioned the architect Josef Hoffmann to build the celebrated Palais Stoclet in Vienna (1905–24). Hoffmann designed all the elements of this house, including the garden, the furniture, the hardware and even the table settings, and Mallet-Stevens had a unique opportunity to study the work in progress and to witness Hoffmann's skill at creating a completely integrated environment. Hoffmann's influence on the younger man's career was to last only a few years, but the interest that he generated in designing all aspects of an environment endured throughout Mallet-Stevens's life. Subsequently, the influence of the Vienna Secession was supplanted by that of traditional Japanese interior design, and Mallet-Stevens was particularly inspired by the sparseness of Japanese furnishings and the decor and the use of walls and bays in defining spaces. He shared the belief, articulated by his friend and collaborator Francis Jourdain, that "One can decorate a room in the most elegant manner by de-furnishing it rather than furnishing it". This idea exemplified the Modernist approach to interior design but Mallet-Stevens's ability to integrate other influences within a modern vocabulary gave his work a distinctive character all of its own.

In 1911 Mallet-Stevens began to publish a column, "L'Art

Mallet-Stevens: hall, Maison Mallet-Stevens, Paris, 1927

Contemporain" in the Belgian magazine *Le Home*. Each article concentrated on a different aspect of contemporary work, often focusing on residential interiors and individual rooms. The text was accompanied by illustrations and views of dining rooms, music rooms, and bathrooms were drawn in the designer's geometric, volumetric fashion. Having lived through an especially savage tuberculosis epidemic, Mallet-Stevens was particularly concerned with issues of health and hygiene; he wrote: "The modern architect's role is to organize an installation which is practical, hygienic, convenient, with air and light in profusion, provided with easy access facilities, and well-planned fixtures and fittings".

The following year Mallet-Stevens received one of his first important design commissions. Madame Paquin asked him to remodel the entrance hall and music room of Les Roses Rouges, her villa in Deauville. The influence of Hoffmann, as well as that of the Glasgow designer Charles Rennie Mackintosh, was still evident, especially in the design of the stairway's handrail and in the composition of the panes of glass in the door lights. But other interior projects of this period were distinguished by the use of massive, wooden furniture and a Fauve-inspired vibrantly colourful palette.

Mallet-Stevens was also a regular participant in the annual Salon d'Automne exhibitions. He first exhibited at the Salon of 1912, where he contributed nearly twenty interior and furniture schemes. These included proposals for dining rooms, bedrooms, exhibition halls, theaters, and shop interiors, all with their respective furnishings. After a break from exhibiting during World War I, which he spent as a volunteer in the air

force, he resumed his contact with the Salon d'Automne in 1922 and was a frequent exhibitor for the remainder of his career. He was also a founder-member of the more radical and progressive Union des Artistes Modernes.

In much of his work Mallet-Stevens collaborated with a group of artist / designer / artisans who shared his enthusiasm for the machine age. He designed interior spaces by manipulating the interplay of horizontal and vertical planes and by manoeuvring masses, wall surfaces and openings to create functional and unadorned, yet expressive compositions. His design for the Hall in a French Embassy, one of five entries in the 1925 Exposition des Arts Décoratifs et Industriels Modernes, was among the most forward-thinking in an exhibition dominated by the Art Deco style, and exemplifies his liking for collaboration and his approach to creating space. The interior reflects his interest in planar surfaces and was articulated by the reshaping of a cube. Stained-glass designer Louis Barillet created the light fixtures with three layered sheets of glass, and the ceiling which was also made of glass. The artists Fernand Léger and Robert Delaunay painted the wall panels, and a bas relief was sculpted by Henri Laurens.

Another important collaborative project was the house begun in 1923 for the Vicomte and Vicomtesse de Noailles in Hyères. Notable collectors of modern art, the Noailleses wanted a home that was indisputably contemporary in style and they gave their architect total freedom in the design. Mallet-Stevens's response was to integrate the interior and the exterior by using translucent, sliding panels in the window openings and doors. He also used green lacquered tubular steel and canvas for the garden chairs that he designed for the pool terrace. A veritable galaxy of other Modernist designers – including Djo-Bourgeois, Pierre Chareau, and Francis Jourdain – were commissioned to design additional pieces of furniture to complement the villa interiors. Marcel Breuer's tubular steel chairs were imported from the Bauhaus in Dessau, and the De Stijl architect, Theo van Doesburg, was invited to decorate the flower room, a room where the floral bouquets were arranged before being distributed throughout the villa. The final building, completed in 1933, was a stylish and exemplary exercise in International Modernism.

In the group of houses built in 1926–27 on the rue Mallet-Stevens, the street that now bears the architect's name, Mallet-Stevens was able to bring theory and practice together. His own home, at no.12, was a volumetric composition punctuated with ribbon windows and overhangs, and was a study in the use of natural and artificial lighting. The spaciousness of the double-size salon was emphasised by the two-storey window containing at its top white stained glass designed by Barillet. Mallet-Stevens was particularly fond of the white leaded glass that was a feature of Barillet's work. He also used much custom-made furniture – some of which he designed himself – and versions of the Breuer chairs previously used in the Villa Noailles. His wife replaced the seats and backs with needlepoint that she made from one of her husband's abstract, geometric designs.

In 1934 Mallet-Stevens was one of several artists from the Union des Artistes Modernes chosen by the Office Technique pour l'Utilisation de l'Acier to design prototypes for steamship cabins. In his lecture on this work, he stressed that ocean liners should be seen as machines, stating: "No more Persian carpets

and varnished woodwork to hide the electrical installations. No more fountains painted on the wall. Make way for real washbasins in stainless steel next to the bunk. Make way for soft but powerful lighting, for mirrors you can actually see yourself in". This marked a radical shift from earlier views which had perceived liners as floating luxury hotels and where the decorations were rich and heavily ornamented but rarely functional.

The apex of Mallet-Stevens's career was the execution of five pavilions at the 1937 Paris Exposition Internationale des Arts et Techniques dans la Vie Moderne, including the Pavillons d'Hygiène, Electricité, Solidarité nationale, and Tabac, and the Café du Brésil. The Café du Brésil resembled the interiors of some of the boutiques he had previously designed in Paris. It used a vocabulary of machine-precision materials with percolators made of cylindrical glass, counters built of steel and chrome, and handrails made of shiny, polished metal.

Some years earlier, in the mid 1920s, Mallet-Stevens had become involved in the burgeoning world of avant-garde film. His first sets, created in 1923–24 for Marcel L'Herbier's *L'Inhumaine*, shocked audiences accustomed to Neo-Classical settings by their aggressively modern appearance, and subsequent productions were equally controversial. Indeed, he was to use his film sets as a platform for experimentation, replacing the traditional painted scenery with constructed sets, many of which featured his own and others' contemporary furniture. Thus, he was able to expose film-goers – a comparatively large section of the general population who would not normally attend the various exhibitions at which he showed his work – to the advances being made in interior design and architecture. And in so doing he hoped that "modern architecture will no longer amaze, it will be understood by everyone; the new furniture will no longer seem eccentric but normal".

Broadly speaking, Mallet-Stevens's career was defined by the two world wars. Prior to the Great War, much of his work was concerned with interior design and decoration, and also included theoretical projects such as the drawings for *Une Cité Moderne*, journalism, and exhibition projects. In the period between the wars his work became more well-known, his career as an architect became more established and many of his most important buildings and interiors were constructed. During the German Occupation of France, he escaped to the southwest with his Jewish wife. He never returned to active practice. His legacy is a wide-ranging body of work, including architecture, furniture, writings and drawings, that underlines his belief in the beauty of simple and pure forms. His work continues to be admired for these qualities today.

SALLY L. LEVINE

Biography

Born in Paris, 24 March 1886, the son of an art dealer and collector. Educated at the École Spéciale d'Architecture, Paris, 1905–10. Active as a designer of interiors and furniture and writer from 1911; designs published in *Le Home* and *L'Art Ménager*, 1911–12. Pilot in the French Air Force, 1914–18. In private practice as an architect and interior designer, Paris, from 1920; worked as a designer of film sets, 1920–29. Regular exhibitor, Salon d'Automne, Paris, from 1912; additional exhibitions included Exposition Internationale des Arts Décoratifs et Industriels Modernes, Paris, 1925, and Exposition Internationale des Arts et Techniques dans la Vie Moderne, Paris,

1937. President and founder-member, Union des Artistes Modernes (UAM), 1929. Friends and collaborators included the architects Pierre Chareau, René Herbst, Francis Jourdain, Djo-Bourgeois, and the stained glass designer Louis Barillet. Professor, École Spéciale d'Architecture, Paris, 1924; lecturer, École d'Architecture de Lille, 1936–40. Published many books and articles on architecture and design and was associated with the journal *L'Architecture Moderne*, from 1923, and on the editorial committee for *L'Architecture d'Aujourd'hui*, 1930. Retired from architectural practice c.1939 to concentrate on writing. Died in Paris, 8 February 1945.

Selected Works

Examples of Mallet-Stevens's designs and furniture are in the Musée des Arts Décoratifs, Paris.

Interiors

- 1914 Les Roses Rouges, Deauville (interiors including the hall and salon): Mme. Paquin
- 1923 Villa, Hyères (building, interiors and some furniture; with Chareau, Jourdain, Bourgeois and others); Vicomte and Vicomtesse de Noailles
- 1924 Château de Gibet, Mézy, Seine et Oise (building and interiors): Paul Poiré
- 1925 Pavillon du Tourisme, Hall d'un Ambassade Français, Studio de Cinéma, and other projects, Exposition Internationale, Paris (interiors and furnishings)
- 1926–27 Houses, rue Mallet-Stevens, Paris, including Maison de J. and J. Martel, Maison de Mallet-Stevens, and Hôtel de Mme. Reifenberg (buildings, interiors, and furnishings: with metalwork by Jean Prouvé and stained glass by Louis Barillet)
- 1928 Casino, Saint-Jean-de-Luz (building and interiors)
- 1929 Apartment building, rue Méchain, Paris (building and interiors including the studio for Tamara de Lampicka)
- 1930 Cafés du Brésil, Avenue Wagram, Paris (building, interiors and furnishings)
- 1931–32 Villa Cavroix, Croix (building, interiors and furnishings): Cavroix family
- 1937 Pavillon de l'Electricité, Pavillon de l'Hygiène, Pavillon des Tabacs, and other projects, Exposition Internationale, Paris (buildings, interiors and furnishings)

Publications

- Une Cité Moderne*, 1922
- Répertoire du Goût Moderne*, 1928–29
- Grandes Constructions*, 2 vols., 1929
- Pour l'Art Moderne: Cadre de la Vie Contemporaine*, 1934
- Vitraux Modernes*, 1937

Mannerism

The Early Renaissance was a cultural phenomenon of extraordinary importance, but relatively localized; it was nurtured and thrived at the Italian courts which had been pacified after the Peace of Lodi of 1454. The succeeding period, encompassing Mannerism, was a culturally well-defined historical period broadly dateable between the beginning of the 16th and the beginning of the 17th centuries.

The term Mannerism was already used by contemporary historiographers such as Giorgio Vasari, and refers to a complex artistic phenomenon with a characteristic aesthetic identity of such forceful appeal that it gained hold within a

short time all over Europe, even in countries barely touched by humanist culture. Its influence was spread widely from Bohemia to the Iberian Peninsula, from France to the Netherlands, and south to the Vice-Kingdom of Naples. Though Mannerism originated in Rome and Florence, its introduction into the North was encouraged by the activity of Italian artists at the European courts, including Primaticcio, Rosso Fiorentino, Nicolò dell' Abate, and Benvenuto Cellini, who all worked at Fontainebleau for the King of France, François I. Other important Italian and Netherlandish artists worked at the Prague court of the Emperor Rudolph II of Habsburg. Here protagonists included the Milanese painter Giuseppe Arcimboldo (1537-93) and Northern painters including the Flemish Roelandt Savery (c.1576-1639) who painted animals from the Emperor's menagerie in mythological scenes.

Mannerism's close relationship with the dynamics of the earlier Renaissance, however, is undeniable, much in the same way that the development of the Baroque is explicable only by reference to this previous phase. In order to define the fundamental characteristics of this style, its peculiarities within the aesthetic field need to be underlined. As Vasari said, the *maniera* follows the "rule", "order", "measure", and "design". During the Renaissance pictorial space was ordered through strict mathematical laws, and the art of depiction had reached

Mannerism: Netherlandish interior by Bartolomeus van Bassen, c. 1620

Mannerism: detail of stucco by Primaticcio, Fontainebleau, 1533-44

a complete formal perfection. It soon became clear, however, that the goals which had been achieved constituted only a first step. Artists felt the need to confront fantasy and intellectual elaboration in order to surpass classical art and react to the stimuli of a new age.

During the 16th century new internal struggles, doubts, and uncertainties surfaced in man's consciousness. Europe was devastated by several fierce conflicts and even more by complex religious and philosophical disputes. Artists, as interpreters of the spirit of their age, tended towards an art of twisted forms, broken lines, grotesque, or straightforwardly monstrous poses, sumptuous and brilliant effects, strong chromatic contrasts, and bright or metallic tonalities.

All of these components surfaced clearly in the ingenious works of some of the period's greatest protagonists, such as Michelangelo. Yet they are also detectable in the works of thousands of anonymous craftsmen and artisans who, aided by the incisive role played by patronage, adapted their language to the new cultural issues of the 16th century and completely embraced the new Mannerist style.

The term Mannerism, although widely used in the literature of architecture, painting, and sculpture, is more rarely used for the decorative arts. As a result, the most important examples of cabinet-making, silversmiths' work, ceramics, and small bronzes during this period are generally neglected in the histories of the Renaissance. During the period a fundamental role was played by the diffusion of printed material and drawings, especially since they spread knowledge about recent discoveries in the field of archaeology. In this context grotesque ornament (an ancient Roman device which combined human and animal forms) is emblematic, for the discovery of Emperor Nero's Domus Aurea in Rome around 1480, and the admiration elicited for the monstrous figures modelled on its walls, precipitated the immediate diffusion of these ornamental motifs. They were called grotesques because the building complex had been filled with earth during Trajan's time in order to build a market above, and visitors to the Domus Aurea had the impression of gaining access to caves (*grotte*). An early example was Pinturicchio's 1490 decor in the salone of the della Rovere Palace. From Venice the motif spread to Lombardy and Southern Germany, where Hopfer published a book of Italian grotesques for use in the applied arts. A Mannerist tapestry from Brussels, *February* from a set of the 12 months, depicts Neptune surrounded by grotesques, cartouches (a device simulating a scroll of parchment), and bizarre figures.

Mannerism in England was influenced by the German Wendel Dietterlin's *Treatise on the Five Orders* (1598) and pattern books produced by Hans Vredeman de Vries. Strapwork is found in a number of Elizabethan chimneypieces. Influenced by Fontainebleau, Dietterlin produced a third edition of strange Mannerist variations on classical orders – distorted animal figures and strapwork. The ornamental motifs were extraordinarily widely diffused throughout the 16th century, and were first reinterpreted by Raphael and his workshop in the decoration of the Vatican Stanze and Loggia. The motifs can be found in frescoes and furniture carvings, on ceramics, fabrics, and metal objects, sometimes in typical designs, at other times in reinterpretations by artists who were familiar with them only through prints and drawings. The crit-

ical fortune of the grotesque was extraordinary, also because continuing archaeological discoveries attracted many Northern European artists to Rome, who, in their turn, contributed to the diffusion of the "Italian manner" in their own countries.

In France, the Florentine painter Franasque Pellegrin published a book (1530) of Italian adaptations of Moorish designs known as *arabesques*: elegant stylized leaves and sinuous tendrils. These typically Mannerist motifs came from the East, brought back by Venetian merchants in the form of decorative artifacts. In Italy the device was first used for textiles, then pottery and floor tiles.

From the School of Fontainebleau a special type of strapwork evolved, a device used for framing which simulated curled and studded leatherwork. Also following Fontainebleau, Hans Vredeman de Vries used Atlantean figures (nude or draped male figures supporting heaven) to flank the windows and doors on the front of a house in Antwerp, c.1560–70. It was on Cornelis Floris's design for Antwerp's town hall that compositions of flat bands, popular in central European architecture, first appeared (1561–65).

Rinceaux motifs ran in a frieze along cornices and the lintels of façades such as the Villa Madama in Rome, or were used in chiselled bands around metalwork. In the early 16th century Daniel Hopfer published samples of friezes with flowers, foliage, and other ornaments.

Not only artists travelled, however: the 16th century was also the time when new horizons opened up and new ambitions flourished in response to the discoveries of unexplored distant countries. Thanks to the first Portuguese colonies, vast quantities of gold, silver, and precious stones reached Europe, while the more intense commerce between Venice and the Netherlands, and the East, made highly precious objects of extraordinary quality available in Europe. The precarious political situation and the great riches that could be gained with commerce favoured the emergence both of a new wealthy and a new titled class, while a large section of the European aristocracy was enjoying renewed prestige. These considerations contributed to some aspects of the development of new tastes characterizing the interiors of palaces and houses of the nobility and wealthy classes.

Mannerist styles emphasized decoration even more strongly than the earlier Renaissance, and though the decoration was often redundant, it was always interpreted according to a unified project and strongly linked to architecture. In contrast to those of the Early Renaissance, the interiors of noble houses presented a more sumptuous aspect, almost to excess. The house had acquired an official function and become emblematic of the social status of its owner and his family. A greater role was attributed to spaces for entertainment, which grew in number with the prestige and power of the family. In the most important palaces a new space was created: the Gallery, which was richly decorated, and generally opened towards the exterior by means of large windows. Echoes of Roman wall paintings can be found in the ochre, yellow, and black colours of the richly decorated and well preserved Galleria of the Vatican's Casino of Pius IV, in itself a feast of Mannerist fantasy and exquisite craftsmanship.

The Galerie François I at Fontainebleau, an enclosed bridge, built in 1528 by Gilles Le Breton, was decorated with painted scenes framed in stucco, and the un-Italian use of strapwork

Mannerism: ceiling of the Sala dei Giganti, Palazzo del Te, Mantua, by Giulio Romano, 1526–31

motifs divided into zones, by Rosso Fiorentino and Francesco Primaticcio, although it has since been repainted. Relief panels on the lower register were in walnut with gold leaf, by wood-carver Francisco Scibec de Carpi, from 1539, and the areas between the windows were divided into panels, with strap-work cartouches and fleurs-de-lis. Smaller panels contained the emblem of François I. Lions' paw feet supported benches between the windows. In England, the 17th century gallery at Aston Hall, Birmingham has much Mannerist carving in the panelling and chimneypiece, and a highly patterned plaster ceiling. Although dating from 1640, the gallery at Lanhydrock House in Cornwall, 116 feet long, is decorated with Old Testament scenes and an ornate plasterwork ceiling with pendants.

Renaissance sobriety became Mannerist magnificence and opulence, the fantasy of decorators was unleashed, and fresco artists achieved artistic solutions of extraordinary complexity. Many examples of these works survive, especially in Italy: at the Palazzo del Te in Mantua, with frescoes by Giulio Romano, including the exuberant Hall of the Giants, which symbolizes the power of brute force, and the Hall of Emblems with its painted heraldic shields and ribbons glorifying the Gonzaga family; at the Casa Vasari in Arezzo, decorated by Giorgio Vasari himself in the 1540s; at the Farnese palaces in Rome and Caprarola; and at the Salottino at Villa d'Este in Tivoli, attributed to Federico Zuccari's workshop. One fundamental element links all these rooms: the quest for astounding effects, the victory of imaginary space over real space. In Northern countries affected by Mannerism, especially the Netherlands, Bohemia, and Bavaria, the fascinating compositions of Italian artists and the most popular classical subjects, diffused by printed sources, soon reappeared in tapestries and upholstery.

An extraordinary monumentality became usual for the decoration of assembly rooms, particularly with the opulent door-cornices and very large fireplace, embellished with classical friezes. The hooded type of chimneypiece was used for a longer period in the North than in Italy. Frequently lavishly decorated, the chimneypiece was often the focal point of a room. In the Queen's Bedroom at Fontainebleau, decorated by Primaticcio, the ornate fireplace is similar to the decorations at the Palazzo del Te. The mascarón, a grotesque head or mask, became a popular motif on fountains and keystones and was the device for a bizarre stucco chimneypiece with huge open mouth forming the fireplace itself, one of four original chimneypieces in the Villa della Torre by Bartolomeo Ridolfi (c.1560).

Ceilings were made primarily in stucco or in painted wood, and their decorations often repeated the motifs of the floors and might be lavishly gilded. Floor maiolica became rather outdated but was still used on the Iberian Peninsula for wall surfaces in the Arab tradition. The most prestigious schemes were often created in geometrical or figurative compositions of coloured marble, stone, or mosaic. In Northern Italy and in Northern European countries wood decorated with marquetry (*intarsia*) was used to cover the lower portions of walls, to highlight sections of the room, for example the doors of Urbino's Sala degli Angeli, and for floors.

One such extraordinary Mannerist interior is the Laurentian Library in Florence, designed by Michelangelo towards the middle of the 16th century at the request of Grand

Duke Cosimo I de' Medici. The ornamental scheme of the inlaid ceiling and the terracotta floor includes a repertory of subjects with strong symbolic meanings linked to philosophical investigations. Some of the most recurrent themes, like the *mascheroni*, the intertwined dolphins, the chimeras, lost their original meaning with time and assume a virtually proto-Baroque purely decorative value. This is a particularly characteristic aspect of a Mannerist style acquired indirectly, or unselfconsciously, especially outside Italy.

The political stability which preceded the success of Mannerism also contributed to the diffusion of a new type of domestic interior, and of furniture and objects for personal use. In time, interiors tended to lose their temporary and multi-functional character, and assumed an aspect closely linked to their specific function and their location within the house. The love of conviviality, the importance attached also to the table as a place for conversation and for business discussion, ennobled it and the table became a stable element of the furnishings. The most typical form for tables in the 16th century was rectangular, though there were also examples of circular tables supported on small columns. The table-top, carved along the sides, rested on two trestles carved with classical motifs, such as griffins or large acanthus leaves. In general these were paired with high-backed chairs, although the 15th-century type of chair called *Savonarola* – a framework of wooden bars crossing in a X-shape to provide seat and support – was still in use. The dowry *cassone* was also still in use, but in richer forms; decorated with carvings in classical style with mythological scenes, or with battles carved in relief, and generally resting on lions' paws. Often the same famous architects or sculptors would design those furnishings. For example, in the Horne Museum in Florence there is a fine Florentine *cassone* which was probably made by Bartolommeo Ammanati, while some Venetian examples refer to the style of Jacopo Sansovino.

A new type of furniture, which was extremely rational since it doubled as a *cassone* and as a simple bench, was the *cassapanca*. This was a chest which could be opened from the top and rested on steps or on four carved legs and almost always surmounted by a backrest or *spalliera*. The sideboard developed from the bread-bin (*madia*) and the flour or grain bin (*arcile*), and was sometimes surmounted by a plate rack or shelves, since plates and various tablewares were placed inside and on it. The latter were generally made of precious metals, or even in gold in the richer households, or in refined ceramic, and after being used they were usually left out on display.

During the 16th century the bedroom began to be decorated according to similar criteria to those employed today: with chests, bedside-tables and chests of drawers in which to store objects and linen. These pieces of furniture generally had doors and drawers arranged in geometrical fashion, and decorated with carved, and sometimes gilded, mouldings.

Collecting underwent a revolutionary transformation in the 16th century, and from a private activity it increasingly became part of the exercise of power. For that reason patronage tended to promote the most magnificent aspects of artistic expression, and to look for extraordinary and amazing effects, rather than for substance. Archaeological finds, oriental products, and exotic curiosities were particularly in demand. In Northern Europe especially, the Renaissance *studiolo* was transformed into a *Wunderkammer* – a room of wonders. In this room the

most curious man-made and natural objects were arranged and exhibited for the admiration of visitors: ostrich eggs and rhino-horns, together with curiosities from the Middle and Far East, and classical findings. These objects were not kept in chests but were placed in purpose-built show-cases or shelves. During the 16th century the concept of museums open to the public also started to evolve, even if the very first example is represented by the Museo Capitolino in Rome, which had been founded already in 1471 by Pope Sixtus IV.

Goldsmiths' work is without doubt among the most prominent sumptuary arts during the Mannerist period, so much so that it can be compared to the applied arts. In that category we should include not only objects made in gold and silver, but also those extremely complex objects in which different materials were used and mounted in precious metal. Benvenuto Cellini's famous salt cellar, made for Ippolito d'Este in Rome, c.1540–43, and completed in France for François I, was made in gold and coloured enamels, portraying Gea, goddess of the Earth, placed opposite Neptune, god of the sea (it is now in Vienna's Kunsthistorisches Museum). Rock crystals, agate, jasper, chalcedony, lapis-lazuli, and malachite are some of the hard and semi-precious stones with which chalices, salt-cellars, caskets, trays, vases, liturgical objects such as candelabras, altar crosses, tabernacles, and altar-frontals were made. The Museo degli Argenti in Florence has an important collection of such objects, mainly of Medicean provenance, while the Kunsthistorisches Museum in Vienna holds many precious items which once belonged to Emperor Rudolph II. The great majority of rock crystal objects by the Milanese workshop of the Miseroni or the Sarachi, or the engraved crystals by Giovanni Bernardi di Castelbolognese, are veritable masterpieces made with great technical virtuosity. Giovanni Bernardi was also the maker of the panels which adorn the Farnese Casket, one of the most extraordinary objects of Mannerist culture, made by Manno di Sebastiano Sbarri in 1548–61 (Capodimonte Museum, Naples).

Another very sumptuous object is the so-called Merkel centrepiece by Wenzel Jamnitzer in gilt silver and embossed for the city of Nuremberg in 1549 (Amsterdam, Rijkmuseum). The same German Mannerist goldsmith also made a chalice formed from a shell held in a complex gilt-silver mount, in which emphasis is given to shape, light and the material (Munich, Schatzkammer). The search for new plastic effects and the esteem for objects of curious natural form (such as horns or narwhale horns) often led to the creation of unique and extraordinary objects, made from one element of organic origin, such as a large blister pearl, and precious metals with translucent enamels or worked in relief. In France, Limoges continued to specialize in the production of enamels, which reached extraordinary levels during the 16th century. In Bohemia, Mannerist culture was typified by the *Handstein*, sculpted groups portraying biblical scenes, with parts in silver, glass, and enamel, on pedestals of gilt silver.

Grand Duke Cosimo I de' Medici had called expert Milanese craftsmen to Florence, and during the last decades of the 16th century the working of *pietra dura*, semi-precious stones such as rock crystal, amethyst, lapis lazuli, for use in sculpture, jewelry, and mosaics, became highly developed, leading to the perfection of technical skills in *commesso* work or inlaid semi-precious stones. In 1588 the Opificio delle Pietre

Dure was founded in Florence. The Medici Tapestry workshops were also based there: a highly specialized enterprise in which important series of tapestries were executed after designs by the most prominent artists of the date, including Francesco Salviati, Agnolo Bronzino, and Joannes Stradanus. Tapestry production also developed in many cities in Northern Europe, including Bruges and Lyon.

In Venice, especially in Murano, the art of glassmaking also developed. Master glassmakers produced complex shapes, applying coloured glass paste: vases and chalices with feathered effects, filigree (*retortoli*), or in *reticello*; objects in ice-glass with gilding and polychrome decorations; and marbled glass intended to imitate hard and semi-precious stones. By the 16th century, the success of Murano glass throughout Europe caused a migration of specialized workers, resulting in the development in other areas of glass *à la façon de Venise* that is sometimes difficult to distinguish from the original. Excellently manufactured glass objects in the Mannerist style could also be found in the Netherlands and Bohemia.

During the Mannerist period the production of maiolica became highly developed, especially in response to the need for tableware and pharmaceutical vessels. Following predominant tastes during the first years of the 16th century, maiolica was generally characterized by strong chromatic contrasts and by decoration based on the classical repertory, or on mythological and moral stories modelled on printed sources. Typical of this phase is historiated decoration, with profane or religious themes taken by pouncing from prints, and painted with bright colours on vases, bowls, and plates. There was also a strong tendency to make the objects more opulent by imitating precious metals. In Italy some tableware was enriched by gilding and by lustre ceramics, a technique in which iridescent metallic reflections were achieved by means of a third firing, and which had already been successfully developed in the Islamic world. Some towns like Pesaro, Urbino, Casteldurante, Deruta, Gubbio, Faenza, Venice, and Castelli d'Abruzzo, specialized in the production of ceramics. As a consequence of the rules imposed by the Council of Trent, during the second half of the 16th century a more sombrely ornamented so-called *compendiario* style was developed in some workshops. An example is the maiolica-type Faenza white-ware (*Bianco di Faenza*), with a white glaze sparsely decorated in blue and yellow, which first appeared in the 1540s (though similar objects were also produced in other centres). Mannerist styles are evident in this ware, in the monumental and complex forms, and architectonic structure, inspired by those of metal objects.

On the instigation of Grand Duke Francesco I de' Medici a workshop was set up in Florence around 1575, which produced a small number of exquisite porcelain objects decorated in white and blue, clearly inspired by Ming porcelain. Between 1525 and 1560 many objects in fine ceramic encrusted with Middle-Eastern motifs, were produced in Saint-Porchaire in the Charente-Maritimes, France. The taste for sumptuous decoration and the most typical precepts of the Mannerist style can also be detected in other categories of objects, such as arms and armour, or scientific and musical instruments.

The search for astonishing effects also determined the construction of non-utilitarian objects. The great majority of

these objects had a precise place within the house: arms and armours were generally stored in the anterooms, while cymbals and clavichords were put in the hall where guests were received.

With the introduction of Realism by painters such as Caravaggio (1573–1610) and a new form of classicism, as shown by Agostino Carracci (1557–1602), Mannerism gradually became less popular and came to be seen as contrived and schematic.

Mansart, François 1598–1666

French architect

A contemporary of Poussin and Corneille, François Mansart, like them, represents a particularly French attitude towards classicism – rational and structured, composed and elegant, the spirit of antique art translated into a French idiom. Mansart was influenced by such French antecedents as the Luxembourg Palace by Salomon de Brosse and Philibert de l'Orme's Tuileries Palace, as well as the Italianate detail he would have seen at the Hôtel d'Assezar and the Hôtel du Vieux-Raisin in Toulouse in his early years. (It is unlikely that he ever visited Italy.) Although he never achieved such worldly success as his nephew, Jules Hardouin-Mansart, perhaps because of his unaccommodating temperament, Mansart is nonetheless considered to have been the finer architect. He was an innovative designer and, as far as the interiors of his secular buildings were concerned, he is celebrated for his spacious staircases and for his part in the development of the type of large townhouse known in Paris as the *hôtel*.

Mansart's remodelling of the Château de Berny at Fresnes in 1623–24 incorporated a staircase built around an open well. This was unusual in France at that time, grand staircases of the period more often taking the form of inclined tunnels. The main staircase is also the most important interior feature of the Château of Balleroy in Normandy, which was probably begun c.1626. Here Mansart used a square open well stair supported by stone vaulting, which he was often to use subsequently. This château, his only work of importance outside the Ile de France, is one of the few buildings by Mansart that has survived in almost original condition. The interior of the ground floor *salle* may be original. The Escalier Mansart which Mansart inserted in 1631 into the Château de Coulommiers was much admired at the time for its spatial ingenuity, including the illusionistic device of a dummy flight of steps that lead nowhere. The stair chamber of his Orléans wing (1635–38) at the Château of Blois survives, although the staircase itself is modern. This space measures about 36 by 30 feet, and the main stair terminates at the first floor, which is surmounted by a stone cove above which is a gallery running round all four sides of the compartment. The corners of the gallery have arched recesses to the window openings so that light enters with Baroque fluidity. The chamber is covered by an oval dome and a cupola, all in stone. The whole interior is executed in the monumentally austere yet gentle monochrome of stone, anticipating Mansart's finest work at the Château de Maisons.

The Château de Maisons was the most important work of his career and was built at Maisons-sur-Seine near Paris between 1642 and 1651 for the immensely wealthy financier René de Longueil. Now known as the Château de Maisons-Lafite, the house survives and provides a unique opportunity to appreciate Mansart's innovative treatment of an interior. Mansart was given *carte blanche* by Longueil and the budget was huge. As far as internal planning is concerned, Mansart's innovation was to move the stair chamber to one side of the usual central position, leaving the adjoining vestibule in the centre of the house and freeing the space at first-floor level for a much longer reception room. The separation of stair chamber and vestibule was also a new development and

Mansart: staircase at Château de Maisons-Lafitte, 1642–51

ensured that the main rooms on the ground floor no longer had to be entered by crossing the stair chamber. Vertically, the internal arrangements make use of a varied section. The lofty reception rooms in the centre of the building are reached by the main stair and low intermediate floors – *entresols* – at the sides and in the wings are reached by small stairs buried in the thick walls which were provided for the less important apartments and service quarters. Throughout, the interior planning is fluid, versatile and masterly.

The main reception room at Maisons, the *salle d'honneur* or *salle des fêtes*, is about 80 feet long, and the far end of the room is separated from the rest by a screen with a central arch and doorways on either side; this part was probably intended for entertainment or as an antechamber to the king's bedroom which lay beyond. In this antechamber is a monumental plaster chimneypiece by Gilles Guérin with caryatids holding fruit. The ceiling of the *salle d'honneur* is strangely unadorned, divided into three compartments and surrounded by a deep plain cove – all white. The arched screen is reflected in the shape of a mirror opposite above which a minstrels' gallery rests on huge corbels. The paintings over the doors are mainly in grisaille apart from the depiction of large Chinese vases in blue. The overall effect is of restrained grandeur.

Other rooms in the building are original, but the most striking part of the house is the spatial sequence of vestibule and stair chamber. The outer doors of the vestibule were once secured by polished steel grilles, wonderfully wrought and now in the Louvre. Executed exclusively in a monochrome of stone and stucco, this monumental vestibule, with low relief panels depicting the elements by Guérin, leads via several steps to the stair chamber, the lower part of which is totally undecorated. The generous open-well stair with its wide stone cantilevered steps and massive stone balustrade leads majestically from here up to the first floor. The balustrade uses a striking motif of interlacing hoops, partly fused at the crossing, with the upper hoops wreathed in acanthus. Each flight of the balustrade was carved from a single piece of stone. As the stair moves up to the first floor, the walls become articulated by raised panels and Ionic pilasters, which are in turn topped by a bold cornice above which playful putti break out in a moment of Baroque exuberance. An oval gallery running round the second floor level leads up to the oval dome which crowns the space.

Earlier, Mansart's Hôtel de la Vrillière (1635–38) had introduced the long gallery to the repertoire of designers of Parisian *hôtels*. This gallery ran down the side of the garden at a right angle to the main building. Fragments of the original Hôtel survive in the building now occupied by the Banque de France, but the present gallery, although on the site of the original and of the same proportions, is a reconstruction. After Maisons, the separation of vestibule and stair chamber was incorporated into many of Mansart's *hôtel* designs, including the Hôtel du Jars (1648–50) where the vestibule was centred on the court with the stair chamber to the side, in the corner. The Hôtel de la Bazinière, where Mansart did improvements between 1653 and 1658, incorporated a very ingenious staircase, S-shaped with swirling steps in the lower flight. This building also had a much admired *cabinet* with a ceiling painted by Charles Le Brun. Apart from the Hôtel de Guénégaud-Nevers (1648–52), which is now a museum, very few of these Parisian buildings now survive, and those that do are mostly altered beyond

recognition. We depend on plans, sections and written descriptions of their original appearance and on Mansart's work at the Château of Maisons-Lafitte to imagine what they might have been.

BARBARA CORR

Biography

Born in Paris in 1598, the son of a master carpenter. Trained by his brother-in-law, Germain Gaultier (1571–1624), and perhaps under Salomon de Brosse (1571–1626), from whom he learned about Italian architecture, though he never visited Italy. First commission in Paris, 1623. Designed Paris churches, c.1632–45. First worked at Balleroy, 1626, Blois, 1635–38, Maisons-sur-Seine, 1642. Appointed Architecte en service des bâtiments du Roi, 1624; Conducteur des bâtiments du Roi et de sa Altesse Royale, 1635; Ingénieur ordinaire de Roi, 1643. Mainly active as designer of Parisian houses, 1642–1660s. Later commissions from Jean-Baptiste Colbert include unexecuted designs for the Louvre and royal chapel at St. Denis, 1660s. Died in Paris, 23 September 1666.

Selected Works

- 1623–24 Château de Berny, Fresnes (remodelling of buildings and interiors)
- 1626 Château de Balleroy, Normandy (building, pavilions and interiors): Jean I de Choisy
- 1631 Château de Coulommiers (staircase): Henri, duc de Longueville
- 1635–38 Château de Blois (Orléans wing, corner wings, gallery and interiors): Gaston, duc d'Orléans
- 1635–38 Hôtel de la Vrillière, Paris (reconstruction, and interiors including the gallery): Louis de la Vrillière
- 1642 Hôtel de Chavigny, Paris (building and interiors): Léon Bouthillier, comte de Chavigny
- 1642–51 Château de Maisons-Laffitte, Maisons-sur-Seine (building and interiors including *salle d'honneur* and *salle des fêtes*): René de Longueuil
- 1648–50 Hôtel du Jars, Paris (building and interiors including the Grand galleries, Grandes appartements, cabinet, and garde robe)
- 1648–52 Hôtel de Guénégaud-Nevers (building, pavilions and interiors): Henri de Guénégaud
- 1650 Hôtel de Condé (reconstruction and interiors including the Grande Chambre and the Grand Cabinet de Mme. la Princesse): Louis II de Bourbon, Prince de Condé
- 1653–58 Hôtel de la Bazinière, Paris (alterations and interiors including alcoves, staircase, *salle*, pavilion, cabinet and gallery): Macé II, Bertrand de la Bazinière
- 1655 Hôtel de Carnavalet, Paris (remodelling): Claude Boislève
- 1665 Hôtel d'Aumont, Paris (staircase): Maréchal d'Aumont
- 1666 Château de Pomponne (remodelling; incomplete)

Mantegna, Andrea c.1431-1506

Italian painter, architect and engraver

Andrea Mantegna worked as a painter and decorative artist during the second half of the 15th century, by which time painted decoration had replaced tapestries as the principal form of wall decoration within Italian interiors, and fresco, in particular, was acclaimed as the most prestigious style of art. Renaissance frescoes generally followed two main types. The most common type during the 15th and early 16th century was the continuous frieze that ran around the room with its base just above eye level or slightly below. This generally featured scenes contained within discrete zones defined by painted architectural members, that conformed to the proportions and shape of the room. By the end of the 15th century a new interest in illusionism had begun to emerge. This led to a move away from the frieze format and ultimately dispensed with both the individual zones and the structure imposed by architectural members, to allow the interpenetration of wall and ceiling decorations. Mantegna's interest in illusionism, evident particularly in his work in the Camera degli Sposi in the Ducal Palace, Mantua, exemplifies this trend and initiated a development that was to culminate in the breathtaking effects achieved much later in the work of Baroque artists such as Pietro da Cortona or Rococo painters like Tiepolo.

Mantegna was trained in the north of Italy, and although nearly all of his working life was spent in Mantua, he was from the beginning of his career fully aware of the developments made by Florentine artists in the depiction of depth and perspective. One of his first works, an altarpiece for the church of San Zeno in Verona, is striking for its unity of space: Mantegna has treated the wooden frame, with its four pilasters dividing the picture area into the traditional triptych, as if it were a screen in front of a scene of the Virgin enthroned accompanied by saints. Using all the perspectival skills so recently developed by writers and artists such as Donatello, Brunelleschi and Alberti, Mantegna sets this scene within a pavilion whose architecture continues the lines of the actual wooden frame, in such a way that the frame appears to be the fourth side. The figures of saints appear to share the same

space as the Virgin, as if free to move from one part of the scene to another. The San Zeno altarpiece represents a significant development in the *sacra conversazione*, and shows an artist who was fascinated from an early stage by the possibilities of fictive space and illusionistic architecture. Mantegna's brother-in-law, Giovanni Bellini, was impressed enough by this treatment of space to repeat the scheme in his own triptych of the Virgin with four saints in the Frari in Venice.

A large proportion of Mantegna's life was spent in Mantua as court painter to a succession of Gonzaga dukes. He was greatly prized by them as one of the finest and most skilled painters, although the slowness with which he worked exasperated each of his patrons. In the context of work on interiors, there is one commission carried out by Mantegna which is of great importance: the Camera degli Sposi in the Castello di S. Giorgio, part of the Palazzo Ducale at Mantua. This relatively small room, misleadingly called the "bridal chamber" since it never seems to have been used for any other purpose than formal court events, occupied Mantegna between 1465 and 1474, and bears witness to his interest in spatial effects first seen in the San Zeno altarpiece.

Two of the four walls of this room present us with a parade of life-sized figures, members of the Gonzaga court and their circle, sitting or walking along the top of a painted dado. The arrangement calls to mind Benozzo Gozzoli's scenes of members of the Medici family as the three Magi riding through a rocky landscape around the walls of the Medici private chapel in Florence (Palazzo Medici Riccardi) of six years earlier, although Mantegna's illusion of space is a great deal more convincing and carefully deceptive than Gozzoli's highly unlikely pageant. The illusion of the whole room being an open-air pavilion is extended by the inclusion of painted leather curtains which are depicted hanging from runners, and drawn back in places to allow glimpses of a landscape. Only rarely, when Mantegna's control of the illusion falters, as in a man standing in front of a pilaster where no room has been allowed for the figure, do we remember that this is highly innovative, and that Mantegna is at the forefront of what was only later to become a tradition of illusionistic work.

The ceiling of the room is covered with garlands through which the painted sky can be glimpsed, a design later developed by Raphael in the frescoes of the Sala di Psyche in the Farnesina in Rome. The form of the ceiling is a shallow concave which is made to seem both much steeper and vaulted by painted and stuccoed ribs. One of the features which makes the architecture of the whole room so convincing is Mantegna's mixture of painted and real stucco details, as in the ribs of the "vault" and in the corbels supporting them.

It is, however, in the famous *oculus* that the greatest originality and skill can be seen. Mantegna's delight in his own skills of foreshortening, practised in paintings such as the *Dead Christ* (Brera) are put to their greatest challenge in the illusion, not only of the balcony around the opening in the centre of the ceiling, but also in the figures peering down on the room from it. In light-hearted spirit, Mantegna has included several putti who have climbed over the edge of the balcony and are bracing themselves against falling into the room. These figures and the pure virtuosity of an orange tree in a tub which is balanced precariously on a bar across the opening, provoked much wonder on the part of contemporary spectators.

It is the first true use of *sotto in su*, a device not taken up until Correggio's ceilings. It is an indication of Mantegna's originality that the illusionistic experiments in the Camera degli Sposi were not fully absorbed until the Baroque, with the great illusionistic work of da Cortona and Padre Pozzo.

CHANTAL BROTHERTON-RATCLIFFE

See also Trompe-l'Oeil

Biography

Born in Isola di Carturo, near Vicenza, c.1431, the son of a carpenter. Enrolled in Guild of Paduan painters, 1441–45; adopted by Francesco Squarcione and trained in his Venetian workshop, 1442–48. Married Nicolasia Bellini, sister of Giovanni and Gentile. Executed frescoes for the Overtari chapel in the Eremitani church, Padua, 1448–55. Part of circle of antiquarians and humanist scholars in Padua and Verona. Worked on several altarpieces, 1453–60. Entered the service of the Gonzaga family, c.1460, working for Dukes Ludovico, Federico and Francesco Gonzaga in Mantua; worked almost exclusively for them for the remainder of his career. In Rome, 1488–90. In service of Isabella d'Este, 1497–1506. Designed his own funeral chapel in S. Andrea, Mantua, c.1504. Obtained title of Palatine Count from the Emperor, 1469; made Knight of the Gilded Militia, 1484. Died in Mantua, 13 September 1506.

Selected Works

Mantegna's paintings are represented in the Uffizi Gallery, Florence; the Louvre, Paris; and the National Gallery, London.

- 1465–74 Camera degli Sposi ("Camera Picta", fresco decoration), Castello di S. Giorgio, Palazzo Ducale, Mantua: Duke Ludovico Gonzaga
- 1484–1519 *Triumphs of Caesar* (now Hampton Court): Duke Francesco Gonzaga
- 1497–1506 Paintings for studiolo in Palazzo Ducale (*Parnassus*, *Expulsion of the Vices*, *Story of Comus*, all Paris, Louvre): Isabella d'Este
- 1504 Grisaille painting (*Introduction of Cult of Cybele in Rome*, now National Gallery, London): Francesco Cornaro

Marbling and Graining

The practice of using paint to simulate the appearance of stone or wood, either within an architectural setting or on furniture, is an ancient one and has a long history within the development of Western interior design. The earliest examples of marbling date back to Classical Greece and Rome, and excavations from Pompeii (AD 79) suggest that the custom of decorating walls with painted representations of masonry, marble and other precious stones was fairly widespread in Imperial palaces and patrician homes. The practice of graining was adopted somewhat later. Its development was closely linked to the fashion for using wood-panelling in interiors which developed in the late Middle Ages, and the technique was well-established in most parts of Europe by the middle of the 16th century.

Both techniques were highly imitative. They were also quite cheap and much of their appeal, particularly at times when transportation was limited and resources such as marble and grained woods were in short supply, can be attributed to their function as an inexpensive substitute for more costly materials. However, as decorators' skills grew and painted effects became correspondingly more complex, it seems that marbling and graining were increasingly admired for their decorative properties alone. Some of the finest and most ornate examples were produced in the 17th and 18th centuries when rooms containing grained and marble walls or furniture were frequently a feature of the grandest homes. With more widespread usage in the 19th century, the quality and status of such work fell, but in more recent years a resurgence of interest in paint effects of all kinds has encouraged a revival in marbling and graining within interiors.

Traditionally, the techniques of marbling and graining require a smooth ground for a convincing effect to be achieved, and when the work is carried out on a wall, the plaster surface is first filled and sanded and the ground colour laid down in flat oil paint. If the work is on a piece of furniture, then the piece is gessoed as if for gilding. The marbling or graining can be executed in oil or watercolour, or a combination of the two used in successive layers. Walnut graining, for example, can be grained in water, fixed and overgrained in oil stain, glazed in water and finished with a coat of oil varnish.

Some graining effects are achieved by combing with leather

Marbling effects in the Painted Room, Hill Court, Herefordshire, 1700

or metal combs – to prevent the glaze from flowing back into a smooth finish, a “meglip” is used to retain the sharpness of definition. In earlier times, this could include the addition of jellied soap, whiting or beeswax dissolved in hot linseed oil. Water graining will not take on a painted surface on its own, so to prevent “cissing” the panel is degreased by rubbing with Fullers earth. The water stain then requires the addition of a binder such as beer, vinegar or skimmed milk mixed with the pigment and the water.

First adopted in England towards the end of the 16th century, early graining and marbling were often quite impressionistic; the aim appears not to have been to copy exactly but rather to suggest, and deceive the first casual glance. Some time between 1626 and 1627, John de Kritz was painting the panelling in Queen Henrietta Maria’s closet at Denmark House (later Somerset House) with simulated graining in “wall nuttree couloure”. The Duchess of Lauderdale’s Private Closet and the Green Drawing Room decorated in the 1630s at Ham House include olive wood panelling which is less than realistic. Many rooms in 17th-century England were panelled in wood and most exotic timber effects were obtained by means of graining executed on deal panelling, which was relatively inexpensive. Mouldings and panels were occasionally marbled to

give an extremely sumptuous effect as in the Painted Room at Hill Court, Herefordshire, where coloured panels are framed by white marbled mouldings interspersed with black japanned stiles.

As the century progressed, there was a greater effort towards accuracy of representation. At Dyrham, where the original paintwork survives from c.1700, marbled panels are to be found lining the staircase, whereas in the Balcony Room, pine panelling is grained to simulate walnut, the pilasters are marbled as porphyry and the mouldings are gilded. Marbling of carcass furniture was common in the 17th century throughout Europe, even to the extent of the marbling of a set of folding stools belonging to Cardinal Mazarin. It does not seem to have been as popular in the United States where panelling was certainly painted, but usually in solid colours rather than in simulated timber.

With the advent of Palladianism in Britain, the fashion for marbling and graining waned until the 1780s when Henry Holland’s work for the Prince Regent at Carlton House revived interest in the techniques. By this time, overall colour schemes were lighter and more delicate than in the 17th century – satinwood and pale oak were more fashionable, or bird’s eye maple as used in the 1830s to decorate the Music Room at

Pencarrow, Cornwall. Graining was now generally restricted to the dado, skirting and doorcases as was the case in the library at Barnsley Park, Gloucestershire, decorated about 1810.

Nathaniel Whittock's influential *Decorative Painters' and Glaziers' Guide* (1827) gives detailed guidance on the techniques of marbling and graining commenting that within "the last twenty years a great improvement in the imitation of fancywoods and marbles has brought it into general use". Regency furniture-makers made much use of overgraining – the use of painted figuring over a plainer wooden background. Many Regency chairs apparently made of rosewood are actually made of beech, a native timber considerably less expensive than rosewood imported from South America or the East Indies. The figure and colour typical of good rosewood is achieved by paint, with the beech providing the grain which shows through the transparent glaze. Similarly, the figuring on walnut panels in case furniture was sometimes "improved" by the addition of painted burr figuring on a straight grained panel. Oak was also simulated on furniture, often on bookcases or cupboards from the servants' quarters, with the base timber frequently in deal. J.C. Loudon recommended that hall chairs, especially, be grained, or alternatively painted to simulate bronze with a dusting of metal powder to complete the effect.

Whittock also considered marbling excellent for halls, passages and the bars of coffee houses: imitations of Siena were good for door posts, passages and furniture painting although he condemned the use of marbling for chairs declaring "nothing can be in worse taste". He suggested the inclusion of gold and silver leaf in the veins of black and gold (Porter) marble, and recommended the use of gilding to imitate brass inlay on simulated rosewood chairs, sofas, bookcases and so on.

Later in the 19th century, the arts of marbling and graining were brought to a high point of technical competence by men such as Thomas Kershaw of Westhoughton, Lancashire, and John Taylor of Birmingham. At an exhibition in Paris, they were required to demonstrate the creation of their exhibited panels since suspicions were voiced that they were real wood rather than painted representations. Panels by Kershaw are on display at the Chadwick Museum, Bolton, and the Victoria and Albert Museum, London.

Technical excellence did not, however, bring with it critical approval, and during the late 19th century design reformers increasingly objected to the use of marbling and graining and other imitative effects. Their objections focused on the supposed dishonesty of these techniques in endeavouring to make one material look like another. Thus, Charles Locke Eastlake, author of the influential *Hints on Household Taste* (1868) described graining as "an objectionable and pretentious deceit, which cannot be excused even on the grounds of economy". Eastlake and other reformers advocated plain, solid colours for woodwork and walls, but marbling and graining continued to be widely used. By the 1880s there were machine-printed, washable wallpapers that simulated the appearance of wood and stone, while increasingly sophisticated painted effects could be found even in extremely wealthy homes.

During the 20th century marbling and graining have generally fallen from favour among fashionable decorators, although they remained in constant use at a more everyday

level and the internal woodwork and external doors of banks, institutions and public houses are to this day frequently grained in simulated oak. A short-lived vogue for DIY graining in suburban houses emerged in the 1940s but was soon superseded by a preference for light colours and more contemporary interiors. But more recently, the resurgence of interest in period styles of decoration has encouraged a renewal of interest in paint effects and faux decoration of all kinds. Popular books, such as Jocasta Innes's *Paint Magic* (1981), include sections explaining how more ambitious consumers might attempt marbling and graining themselves and marble-pattern wallpapers have once again become fashionable. Both techniques, however, are complex and require considerable knowledge and skill. They are still taught to a few professional painters and decorators in technical colleges in Britain, but most contemporary graining and marbling is executed by specialist *trompe-l'oeil* artists and interior decorators, rather than by the traditional craftsmen or artisans as was always the practice in the past.

Marchands-merciers

Marchands-merciers were members of a guild of Paris merchants who played a central role in the design and circulation of luxury goods between the late Middle Ages and the French Revolution. In contrast to artisans, whose guild regulations limited the kinds of materials and techniques they could use and allowed them to sell only the objects they made, the *marchands-merciers* were subject to different stipulations. They could buy and sell a wide variety of objects in many media, including items for the decoration of interiors, but they were forbidden to manufacture anything themselves. Through extensive wholesale and retail commerce, by commissioning artists and artisans to create new types and styles of objects, and by displaying their wares in elegant boutiques, *marchands-*

merciers helped to shape the development of interior design before the emergence of modern antiques dealers, interior decorators, and department stores.

There is evidence of *marchands-merciers* in Paris as early as 1137, and in the 13th century an administrative system was established to regulate their activity. Early *marchands-merciers* (often called simply *merciers*) dealt primarily in domestic and imported luxury fabrics, trimmings, and costume accessories. During the 14th century, their range of wares expanded to include toilet articles, kitchen utensils, toys, musical instruments, spices, and ecclesiastical objects. Statutes issued in 1613 continued to emphasize textiles and personal adornments such as jewelry, hats and swords, but also included mirrors, paintings, and items of furniture such as coffer and cabinets. From the 15th century on, *merciers* belonged to the *six corps*, the six largest, wealthiest, and most powerful trade guilds of Paris.

Marchands-merciers made their best-documented and most significant contribution to interior design during the 18th century, when objects for the decoration of rooms were produced in unprecedented quantity and variety. Jacques Savary des Bruslons, in his *Dictionnaire Universel de Commerce* (1723), listed twenty specialties within the guild of *merciers*, distinguished mostly by medium and including sellers of gold trimmings, metal utensils, and paper goods. Furniture and fittings were handled primarily by members of Savary des Bruslons' more eclectic 13th category, the *marchands d'objets d'art*, who sold paintings, prints, light fixtures, sculpted figures in various materials, clocks, tables and cabinets, and "other merchandise and curiosities related to the ornamentation of apartments." This range of wares often also included mirrors, porcelain, and natural artifacts such as shells and coral. The definition of specialties was unofficial and quite flexible, and merchants calling themselves *marchands-joailliers* or *marchands-bijoutiers* often sold furniture and fittings together with jewelry, precious stones, and small items like toys, fans, and snuffboxes.

In addition to selling objects, the *marchands-merciers* also cleaned, repaired, and even redesigned them, and provided delivery and installation. Many of their shops were located in the fashionable quarter around the rue Saint-Honoré, and were among the major attractions of Paris for residents and visitors alike. Contemporary descriptions emphasized the quantity, variety, intricacy, and expense of the objects for sale, and the public's avid interest in viewing new designs. The Baroness d'Oberkirch, who visited Dominique Daguerre's boutique La Couronne d'Or in 1784, reported that "one could not approach the shop, there were so many people there; the throng crowded around a dining room buffet of admirable workmanship" (*Mémoires*, Paris 1970, p.306).

Because *marchands-merciers* were prevented by guild regulations from manufacturing objects themselves, they exerted their most creative influence on interior design by inventing new types of objects and commissioning artisans to manufacture them. The production of a multi-media object, such as a dressing table fitted with locking drawers and accessories of porcelain, silver and ivory, required contributions from members of many different guilds, and perhaps also models or drawings from a sculptor or draughtsman. The work of the *marchand-mercier* was thus to orchestrate the work of others,

and some merchants developed close associations with particular artisans. Thomas-Joachim Hébert, for example, who supplied much furniture to the court of Louis XV, consistently patronized the *ébénistes* (specialists in exotic wood and lacquer veneer) Mathieu Criard and Bernard Vanrisamburgh.

Design concepts popularized by *marchands-merciers* during the 18th century included furniture veneered with lacquer panels, new types of small, functionally specialized tables, and complex decorative ensembles made from oriental or European porcelain vases and figurines mounted in gilded bronze and embellished with porcelain flowers from the French manufactory at Vincennes. A flourishing fashion in the 1760s and 1770s for furniture decorated with Sèvres porcelain plaques was initiated and perpetuated by the *marchand-mercier* Simon-Philippe Poirier and his successor Dominique Daguerre, who held a virtual monopoly on Sèvres plaque production.

The diversity of objects sold by *marchands-merciers* was advertised in their trade cards and labels, such as the one designed by François Boucher in 1740 for Edmé Gersaint's shop À la Pagode. The most famous image of a Paris luxury boutique is Antoine Watteau's 1720 *Enseigne de Gersaint* (Schloss Charlottenburg, Berlin), painted for the same merchant but depicting an earlier establishment, Au Grand Monarque, that seems to have emphasized paintings and selected furnishings over the proliferation of small, often exotic objects featured at À la Pagode. The account book of Lazare Duvaux's business at Au Chagrin de Turquie between 1748 to 1758 offers much information about the range and price of the goods and services offered by a *marchand-mercier*, for a clientele that included Louis XV and Madame de Pompadour as well as courtiers, collectors, financiers, artists, and visiting foreigners.

In a culture where manual labor was considered inferior to intellectual and artistic activity, the fact that the *marchand-mercier* sponsored artisanal work without practising it himself granted him a unique status within the guild system. Savary des Bruslons observed that whereas other merchants in the *six corps* engaged in both manufacture and commerce, the *marchands-merciers* were "the most noble and the most excellent of all ... insofar as those who comprise it do not labor and make nothing by hand, except to beautify things that are already made." A popular saying dubbed the luxury merchant a "seller of everything, maker of nothing," a phrase used by Denis Diderot in the *Encyclopédie* (1751-65) to define the term *mercier*. Pierre Verlet, in an important 1958 essay, has discussed the ways in which coordination, transformation and beautification defined the activity of the *marchands-merciers*.

In 1791, the guild system of which *marchands-merciers* were a part was abolished in accordance with Revolutionary ideals. However, through their multiple roles as importers, designers, patrons, liaisons between craftsmen and consumers, and proprietors of public venues for the display and purchase of decorative objects, these virtuoso merchants had made a major contribution to both the aesthetic and the commercial development of interior design.

Marot, Daniel c.1663-1752

Franco-Dutch architect and designer

Born into a family of Huguenot craftsmen, Daniel Marot was a designer of central importance to late 17th-century taste. He trained as an engraver, and in the early part of his career he worked as an engraver and designer of ornament under Jean I Berain and was closely involved with the royal workshops. But in 1685 Marot was forced to flee Paris following the revocation of the Edict of Nantes. He went to the Protestant Netherlands and established himself as designer to the Stadtholder, William; he subsequently became Architect du Roi when his patron (William III) ascended the English throne in 1688. Marot was a designer of international stature, and his output was enormous. He was the first architect in Holland who attempted to coordinate all the decorative elements of a room, and as well as designing complete houses, he could provide drawings for decorations and all the furnishings. Many of these drawings were widely disseminated in engravings, and his designs became the basis for the sumptuous forms that dominated aristocratic interiors until the demise of northern European Baroque in the 1740s. His style remained curiously static throughout his career and is best represented by his

work at Het Loo, William III's country residence at Apeldoorn in the Netherlands.

Marot was the son of Jean Marot, a designer who published volumes of engravings throughout the 17th century; his style was influenced partly by his father's work. But it was the intricate forms of Berain's designs that formed the foundations of his career. Marot's exposure to the disparate skills and activities embraced by the royal workshops also undoubtedly encouraged his involvement with an enormous variety of different media and designs. Much of his work related to interiors but he also often ventured into formal garden design.

In 1686, soon after his arrival in the Netherlands, Marot published a set of engravings of interiors. His first commissions came later in the same year with work at Slot Zeist and Honslaardijk. Some of the essential elements of Marot's interior style were already evident in the porcelain room that he created at Honslaardijk for the future Queen Mary. This room included oval mirrored panels combined with stucco work on the ceiling and a large, tall chimneypiece – stepped for the display of porcelain. Both features reappeared often in his later work.

At Het Loo Marot was given his first opportunity to design a succession of different rooms within the same house. The most complete and characteristic rooms are the library and the new dining room, both executed in about 1690. The library has a mirrored ceiling similar to the one at Honslaardijk, and the chimneypiece is also typical of the Marot style with an ensemble of a clock and painting surmounting the fireplace to provide a unifying focal point. Marot's own engraving of the room also shows the curtain gathered up to form festoons, a device that rapidly became popular in England and the Netherlands.

The dining room embodies Marot's contribution to a modern concept of interior design whereby the disparate elements of a room are integrated to produce a harmonious and unified whole. The walls are white plasterwork with gilded bands to define space, and also to band the pillars which separate the serving and eating areas. Armorial tapestries either side of the chimneypiece are decorated with floral swags; acanthus scrolls and lattice work panels combine with military motifs. The chimneypiece itself is of a grey marble, which matches the grisaille panels on the ceiling, and is surmounted by an armorial sculpture. The serving area is decorated with pilaster strips and two large Baroque shells; two figures seated on either side of a plinth form the focal point of the third wall. Throughout the other rooms of the palace, such as Queen Mary's bedroom and closet of 1686, the decorative motifs of the dining room occur in the damask wall coverings. Most of these are executed in Marot's preferred textile colour schemes of red, green or yellow. The main staircase is the last of the areas of Het Loo shaped by Marot. Pastoral scenes can be seen through a screen of columns, creating an illusionistic device very similar to that of Charles Le Brun's *Escaliers des Ambassadeurs* at Versailles; a design that Marot would almost certainly have seen while he was working in Paris.

The work at Het Loo established Marot's reputation as Architect du Roi, and he went on to work within both Dutch and English royal circles. Among his Dutch commissions, the Trêveszaal at the Binnenhof (The Hague) of 1697, the dining room at Kasteel Duivenvoorde and the white room at Huis ten

Marot: design for a state bedchamber, c.1703

Bosch all reproduce the elegant unity that he achieved in the Het Loo dining room.

When William became king of England, Marot was once again called upon to help with the decoration of royal residences. However, English taste and design practices meant that Marot's contribution was of a more supervisory nature. Often, it would be his prints which shaped an interior, and not the man himself. This role is easiest to understand at Hampton Court, which William extended in the 1690s and then furnished from 1699 to 1700. Chimneypieces, gilt pier suites and coordinated textile hangings are all easily identifiable as Marot ideas; but the overall effect of these apartments is more a result of William Talman's directorship of the project. Likewise, the original decoration of the king's private eating room is highly reminiscent of Marot's equivalent designs at Het Loo; yet there is no evidence that he designed or directly supervised the project.

In addition to Hampton Court, Marot also worked at several of the residences belonging to the Duke of Montague. The design of wall panels at Boughton House are identical to a set of drawings known to be in Marot's own hand. Scenes of Apollo, Daphne, Diana and Endymion are set among characteristic strapwork, acanthus swags, Baroque shells and lattice-work panels. As in Marot's Het Loo interiors, red, blue, and green are the dominant colours.

Marot's designs for state beds were also popular in England:

the Boughton and Melville beds are both the result of a collaboration between Marot and the Huguenot craftsman Francis Lapierre. The beds are tall and have flying testers extravagantly decorated with the feathered plumes and damask swags that are illustrated in the designer's engravings. The headboards are carved with putti and latticework; their outline is alive with scrolling contours. These creations derive from French state beds of the 1680s and particularly the example that was placed in Louis XIV's Trianon de Porcelain at Versailles. They are rarely found in Marot's Dutch interiors, which lack the excessive formality and luxury that is evident in English equivalents during this period. The death of William in 1702 did not bring Marot's influence to an end; the publication of Marot's engravings in 1709 and additional work for the court circle helped ensure that his designs remained popular.

In his capacity as an architect, Marot designed Huis Schuylenburch at 8 Lange Vijverberg, The Hague (1715). The movement of the façade of this building, particularly in the central balcony arrangement, derives from the scrolls and swags that are the essence of the Marot style. The interior was designed mostly by Luraghi, an Italian with whom Marot had collaborated at Het Loo. But the chimneypiece in the new dining room stepped for the display of porcelain, undoubtedly has its roots in his engravings.

The second volume of prints in 1713 again made Marot's designs more accessible to those outside of the royal circle. The

plates depicted objects ranging from snuff boxes to garden urns, thus widening his influence on domestic design of all types. Marot also transposed his ideas onto the classical Dutch gardens at Het Loo, Hampton Court, and Kensington Palace. These formal parterres created a vision of decorative unity that had never existed in the work of his predecessors.

Major restoration work at Het Loo has ensured that Marot's finest interiors are visible today. Similar projects at Hampton Court and Huis Schuylenburch have also revealed his achievements as an architect and garden designer. The evidence of these surviving works and of his engraved designs means that Marot's contribution to the development of fully integrated interiors is now clear.

EMMA HART

Biography

Born in Paris, c.1663, the eldest son of the architect and engraver Jean Marot (1619–79). Trained in his father's studio; worked as an engraver and designer of ornament under Jean I Berain. Married Catherine Maria Golle, niece of Pierre Golle, French royal cabinet-maker, 1694. Left Paris after the revocation of the Edict of Nantes, 1685; entered the service of the Stadtholder, Prince William of Orange (later William III of England); appointed Architect du Roi, 1688; received a pension from 1698. Worked as an architect and designer in England for several periods, 1689–1709, and in Amsterdam and The Hague until 1713; settled in The Hague after 1713. Published numerous suites of designs for furnishings, ornaments and interiors from 1698. Died in The Hague in 1752.

Selected Works

Many of Marot's designs for furnishings and interiors appear in the collected editions of his works; examples of etched designs are in the Victoria and Albert Museum, London, Ecole des Beaux-Arts, Paris, and the Cooper-Hewitt Museum and Metropolitan Museum of Art, New York.

Interiors

- 1686 Slot Zeist, Utrecht (interiors and garden buildings)
- 1686 Honslaardijk, near The Hague (porcelain room)
- c.1687–1702 Het Loo, Apeldoorn (interiors, including the library, dining room, Queen Mary's bedroom and closet, and main staircase; gardens and garden buildings): Prince William of Orange
- 1689–98 Hampton Court Palace, Middlesex (gardens and details of the interiors including the Water Gallery): William III and Queen Mary
- c.1689–94 Boughton House, Norfolk (wall panels and state bed)
- 1696–98 Binnenhof, The Hague (interiors including the Trêveszaal)
- 1715 Huis Schuylenburch, The Hague, Netherlands (building and details of the interiors, including the anteroom, dining room and bedchamber, and chimneypieces): Cornelis van Schuylenburch
- 1717 Kasteel Duivenvoorde, Voorschoten, Netherlands (building and interiors including the dining-room)
- 1734–39 Huis ten Bosch, The Hague (additions and interiors, including the White Room): William IV

Marquetry

The term marquetry, derived from the French word for mark (*la marque*), implies an attempt to emulate painting with arrangements of naturally and artificially coloured woods, and, less often, metal, ivory, horn, mother-of-pearl, or semi-precious stones. These materials are organized in floral, geometric, or pictorial patterns, usually framed by narrow strips of wood or metal (stringing) with wider bands of wood laid so that their grains are perpendicular to one another (cross-banding). Marquetry is related to inlay, but differs from it in that the various materials are set not into the solid but are fitted together to form a flat veneer that is in turn applied to items ranging from cabinets to snuff boxes.

Practised in 16th-century Italy, marquetry was also mentioned in a statute of 1580 regulating Parisian cabinet-makers. On the evidence of style, however, it appears that 17th-century Flanders was the more direct source of inspiration for European work, and that it came to blossom in both France and England around 1675. English craftsmen supplemented Flemish flower and foliage designs with cross-sections of branches arranged like oysters on a plate ("oystering"), and the intricate, non-representational patterns known as "seaweed" or "endive" marquetry. Marquetry fell from favor in England when mahogany replaced walnut as the major

cabinet wood (c.1720). It reappeared around 1765 when satinwood became popular, and characterizes many of the pieces designed by Robert Adam. Thomas Sheraton illustrates similar work in his *Cabinet-Maker and Upholsterer's Drawing Book* (3rd edition, 1802) and *Cabinet Dictionary* (1803), but describes it as "japanned" (lacquered), rather than inlaid. Influenced by Sheraton's drawings, furniture-makers in Federal America produced inlaid veneers marked by bellflowers, simplified eagles, paterae, and stringing, but their work lacked the geometric and pictorial quality that would qualify it as marquetry.

Marquetry lasted longest, and came to its fullest development in France. In the 17th century, florals gave way to arabesques of metal inserted in a tortoiseshell ground, some in *contre-partie* (figure-ground reversal). This approach – now identified with André-Charles Boulle and known as "Boullework" – was actually adapted from Italian and Flemish prototypes. Later French marqueters (*ébénistes*) often integrated geometric, floral, and pictorial designs. The popularity of their work made marquetry the preferred mode of decoration in France from the time of its introduction to the end of the Ancien Régime, rivaled only by the lacquerwork with which it was often combined. Pictorial marquetry was revived in Nancy at the turn of the 20th century by Emile Gallé and his associates, who developed their designs around the natural colours and grains of wood. In this they followed, perhaps unknowingly, the example of the *ébéniste* David Roentgen, who had avoided tints so that his work would resist time and exposure to light.

In 18th-century France, patterns could be generated by a decorator, architect, or *ébéniste*, and were often reused; some marqueters even cut their patterns from thin sheets of tin or copper so that they would last longer. The pattern was traced or punched onto the body of the piece to be veneered, as well as onto the wood strips that would make up the veneer. After scoring the backs of these strips, the marqueter coated them with the "English glue" used by good craftsmen on both sides of the Channel. He then tapped the wood into place with a light hammer, heated it briefly with a small iron, and wiped it clean. The piece was tapped with the head of the hammer, so that any hollow sound would reveal that the veneer was not fully seated. Once an area had been covered with veneer, it was put under pressure with clamps or a cushion of hot sand, and allowed to dry. This series of steps might take many days if the artisan were working with the parabolic curves of the Rococo style. When the piece was fully veneered, the marquetry was planed to a uniform thickness. It was then sanded with such materials as ground glass, pumice, sharkskin, crushed chalk, or the dampened stems of thorny plants. Finally, the pores of the smoothed veneer were filled with powdered pumice rubbed in with alcohol, the surface was sanded once again, and wax or clear lacquer was applied as a sealant.

Domestic and exotic woods used in marquetry were cut with hacksaws to a thickness of about one twelfth of an inch by specialized sawyers. The thin sheets allowed the most economical use of expensive imports, a pound of which could cost up to 3 livres – the average weekly wage of a semi-skilled artisan. The woods were selected for both grain and colour: an 18th-century list of naturally-occurring hues included one black, three violets, four greens, 16 yellows, 22 whites, and 24

reds. Manufactured colours were produced by dyers who combined vegetal, mineral, or metallic colouring agents with nitric acid, lye, quicklime, or stale urine. The English palette was relatively restricted, but French marqueters supplemented natural wood tones with a variety of tinted finishes: three greens, four blacks, 17 whites, 21 yellows, and 33 reds were in common use. Craftsmen from both countries might introduce other materials into the pattern, but this practice diminished in popularity after the 17th century.

The pre-eminent marqueters have been French, or Germans who worked in France. In addition to Boulle and Roentgen, any list of *ébénistes* must include Charles Cressent, Antoine-Robert Gaudreau, Jean-François Leleu, Jean-François Oeben, and Jean-Henri Riesener. The list does not include Jacques-André Roubo, a craftsman known not for his products but for his influential *L'Art du menuisier* (1769–75), a four-volume treatise on cabinetry techniques and the aesthetics of furniture production and decoration.

Masreliez, Louis 1748–1810

Swedish painter and designer of interiors and furniture

Louis Adrien Masreliez was the most celebrated decorator in Sweden in the late 18th century. Much of his work was in a severe Neo-Classical idiom, and he introduced the Pompeian style to Scandinavia. Patronised by royalty, he was also appointed Professor at the Swedish Royal Academy of Fine Arts in 1784 and Director in 1805, and he had many students and followers.

Masreliez was born in Paris into a prominent family of French sculptors and carvers. His father, Adrien Masreliez, arrived in Stockholm in 1748 to work at the Royal Palace, where he became the foremost carver of ornament. Within a few years he had the largest atelier and workshop in Stockholm and Louis and his younger brother, Jean-Baptiste, began to train there from an early age. From the age of ten, Louis was also enrolled at the Academy where his ambitions to become a great historical painter were encouraged. A precocious and talented student, he won his first medal for drawing when he was just eleven and numerous other awards followed in subsequent years. A scholarship and financial assistance from Queen Louisa Ulrika enabled him to travel abroad, and he visited Paris in 1769, Bologna in 1770, and remained in Rome from 1774 to 1783 before being recalled to Sweden by Gustav III. Much of his time in Italy was spent studying the art and architecture of the classical and Renaissance period but he also mixed with contemporary artists and designers and was particularly impressed by the work of Jacques Louis David, Giovanni Battista Piranesi and Raphael Mengs. Under their influence he embraced the new Neo-Classical style, and when he returned to Sweden it was not as an artist that he was in demand but as a skilled and knowledgeable decorative painter.

Masreliez's first major commission was to decorate the small Divan Anteroom in the Royal Palace in the newly-fashionable Pompeian style. Much pleased with the results, Gustav commissioned him to re-decorate first his Divan room and then the Queen's Divan room which was presented to her as a Christmas gift in 1787. The Queen's room was an elegant feminine interior incorporating wall-panels painted in light pastel colours with winged genii holding baskets and garlands of flowers. Pilasters and niches containing alabaster statues were placed between the panels and the long low divan-sofa, after which the room was named, was covered in rose coloured silk. The Queen was so delighted with the effect that when she moved to another part of the palace ten years later, she ordered the room to be dismantled and reconstructed in her new apartment.

A trip that Gustav III had made to Italy in 1783–84 provided many ideas for his private country estate, Haga, on the outskirts of Stockholm. Masreliez was employed to carry out the complete redecoration of the Haga Pavilion from 1789 and the interiors were among the finest that he ever made. His work is remarkably well preserved and much has survived almost unchanged to the present day.

The first room in the Pavilion is the small Vestibule whose simple style and monochrome grey colour scheme was inspired by the Villa Farnese at Caprarola. The dining room is even more austere and contains tall arched windows on both sides of the room and painted grisaille wall decoration that simulated classical pilasters and frescoes depicting scenes from classical mythology. It was the only one of Masreliez's interiors in the Pavilion that attempts to imitate an Antique Roman interior and it includes numerous classicising features and details. The copper-clad stove, for example, is shaped like a column and marbleised, while the tall doors are painted in bronze to resemble antique gates. Similarly, the serving tables are shaped like antique altars, but, surprisingly, the dining chairs are based on a design by Thomas Chippendale.

The richest effects were reserved for the Grand Salon where Masreliez was inspired by Raphael's interpretation of the Pompeian style. The result is one of the finest Pompeian rooms in Europe with walls divided into four sections, each of which is devoted to a classical divinity – Apollo, Minerva, Jupiter and Juno. The painted decoration used a quantity of bright colours and gold. The carving was carried out by Masreliez's younger brother, Jean-Baptiste. Masreliez also designed large, comfortable *klismos* chairs based on antique models for this and other rooms in the Pavilion.

The decoration in the Small Salon is concentrated upon the overdoors where Masreliez designed allegorical paintings commemorating two important events in Sweden's war against Russia (1788–90) which had just drawn to a close. The walls were covered in patriotic blue and yellow silk damask (the colours of the Swedish flag).

The last room in the main apartment, arranged *enfilade*, was the dazzling Mirror Salon. This light, airy interior, was considered by many to be Masreliez's finest work and included two lines of tall arched windows stretching from floor to ceiling arranged along one long, and one shorter, end wall. The other walls are covered with large mirrors which reflect the greenery and water in the landscape of the park outside. Grand crystal chandeliers, and panels carved with gilt arabesques similar to those used by the Adam brothers, give the room a festive atmosphere.

Two rooms behind the Grand Salon – the bedroom and the library – were designed for Gustav's private use and complete the decorations on the ground floor. The bedroom is quite small and contains an alcove for the bed and walls covered with blue silk. The interior of the library was designed around an antique marble fireplace that the king had purchased in Rome from Piranesi.

The first floor includes a Divan room and anteroom which were the first interiors that Masreliez worked on, beginning in 1789. The Divan room was an intimate sitting room containing a long, low sofa. Seated directly beneath a wallpainting of the Apotheosis of Apollo – an appropriately chosen subject since Gustav liked to think of himself as a modern-day Apollo – the king used this room for council meetings and to receive visitors. The decoration of the walls is rich and colourful and includes pilasters and niches holding alabaster busts and statues in a design strongly influenced by the work of Raphael and Giulio Romano.

Several large commissions from other members of the Royal family followed the completion of the Haga Pavilion. Masreliez decorated a palace for Princess Sofia Albertina in Stockholm (1792–93) and additional apartments in the Royal Palace for Prince Carl (1792–95), Gustav Adolf IV (1795–1800) and the Dowager Queen Sofia Magdalena (1795–1800). By this time, Masreliez had become Sweden's most sought-after decorator and he also designed many interiors of country houses and apartments for wealthy members of the Swedish bourgeoisie and aristocracy. In addition, he designed numerous items of furniture and *objets d'art*. Fortunately, between 400 and 500 of his drawings of interiors and furnishings survive, as well as many of his actual interiors. These have not only greatly facilitated the study of his work

but also bear witness to the consummate proficiency and range of his skills.

HÅKAN GROTH

Biography

Born in Paris in 1748, the son of a carver, Jacques Adrien Masreliez (1717–1806); elder brother of Jean-Baptiste. Family settled in Stockholm, 1748. Trained with his father, and admitted to the Royal Academy of Fine Art, Stockholm, 1758. Received first commission for altarpiece, 1764. Received royal scholarship to travel to Paris, 1769. Further bursary from Academy of Fine Arts to study in Rome, 1770. Attended Bologna Academy, of which he became a member, and lived in Rome, 1774–83. Returned to Stockholm, 1783. Professor, Royal Academy, Stockholm, 1784, and Director, 1805. Made Court Intendant, 1803. Died 19 March 1810.

Selected Works

More than 500 drawings by Masreliez are preserved at the Nationalmuseum, Stockholm.

- 1785–87 Royal Palace, Stockholm (Divan anteroom and Divan room): Gustav III and Queen Sofia Magdalena
- 1789–92 Haga Pavilion, Stockholm (interiors and furniture): Gustav III
- 1790 Tullgarn, near Trosa (designs for bedroom, executed by Jean-Baptiste Masreliez): Duke Fredrik Adolf
- c.1790–92 Governor's Residence, Falun (salon, dining room): Governor J. M. af Nordin
- 1792–94 Palace of Princess Sofia Albertina, Stockholm (complete interior decoration and some furniture): Princess Sofia Albertina
- c.1792 Salvii Gränd (apartment), Stockholm (salon, dining room, bedroom): Wilhelm Schvardz
- 1792–95 Royal Palace, Stockholm (audience hall, salle de compagnie, Blue cabinet, Italian cabinet, bedroom, divan): Prince Carl, later Carl XIII
- 1795–1800 Royal Palace, Stockholm (Dowager Queen's apartments): Dowager Queen Sofia Magdalena
- 1795–1800 Royal Palace, Stockholm (Council room, divan rooms, bedchambers and furniture): Gustav Adolf IV and Queen Fredrika

Mass Production

The roots of mass production lie in the application of steam power to the manufacture of goods in the late 18th century, during the dawn of the Industrial Revolution. This affected interior design in a number of ways. The production of materials for the interior no longer employed hand-crafted methods. This meant that for the first time wallpapers and textiles were roller-printed rather than hand-blocked, leading to a greater choice for the consumer in the Victorian era but also a decline in taste, according to guardians of good design like John Ruskin. Furniture production also moved from a craft-based activity to a factory-based activity as demand grew.

Some designers, particularly those of the Arts and Crafts Movement, attempted to stem the tide of mass production by celebrating the virtues of handcrafts and deriding the anonymity of machine production from 1861 until well into the 20th century. The hand-made came to carry far more prestige during the 20th century with the work of individual makers achieving great popularity: English examples include hand-made kitchens by Smallbone and wooden furniture by Lord Linley. Similarly, the work of the decorator came to be prized, as it entailed an individual touch, which could not be easily replicated. However, mass production benefited the consumer in that a huge range of goods was available at a reasonable price. Components of the domestic interior were no longer the preserve of the wealthy, who were able to buy a bespoke service from an upholsterer or decorator. Manufactured furniture, wallpaper and furnishings could be purchased through the department store from the late 19th-century onwards.

The abstract idea of mass production provided a major inspiration for the designers of the Modern Movement; the key concepts of standardisation and modularity informed their work. At the Bauhaus School of Design in Dessau, Germany, for example, the furniture designer Marcel Breuer created the *Wassily* chair in tubular steel. The chair was designed in 1925 to furnish the artist Wassily Kandinsky's staff house; Breuer based the design on the strength and lightness of the bicycle frame. Manufactured by Standard Möbel, the chair is extremely expensive and costly to make although it is imbued with a machine aesthetic. Standardised, mass-produced furniture of this period is best exemplified by the Thonet bentwood chair. By the mid-1920s the factory which Michael Thonet had founded in Moravia had produced one hundred million of the

Vierzehner chairs. Bauhaus design was machine-inspired, and its products were formed to look as if they had been produced in a factory for the mass market, whereas in reality their style and cost were more likely to destine them for the fashionable, middle-class interior.

Similarly, Le Corbusier's interior design work was inspired by mass production. His design philosophy was published in the periodical *L'Esprit Nouveau*, which he founded in 1919 with the artist Amédée Ozenfant. He compared the smooth lines of contemporary cars with the Parthenon to demonstrate that the same everlasting and timeless aesthetic was in operation. For Le Corbusier, both represented type-forms, or the ultimate solution to a design problem. He applied such theories to the Pavillon de l'Esprit Nouveau, which he designed for the 1925 Exposition Internationale des Arts Décoratifs et Industriels Modernes in Paris. The overall design was based on a modular system, and a standard unit of measurement determined the overall proportions. The furniture used was already in mass production or had been designed as prototypes; for example, the interior contained a Thonet chair and a table produced by a hospital furniture company. At the Salon d'Automne in 1929 Le Corbusier showed the "equipment of a dwelling" layout, designed in partnership with Charlotte Perriand. This comprised a large living area with smaller rooms leading from it. There was built-in, modular storage space and extensive use was made of glass and metal. This machine aesthetic was an integral part of the Modern Movement style and influenced both domestic and commercial interiors from 1930 until the onset of Postmodernism in the late 1970s. Kitchen design in particular has benefited from the effects of mass production and the machine aesthetic.

The Frankfurt Kitchen, designed by Grete Schutte-Lihotsky in 1926 for mass housing in the German city, was particularly influential. Space was at a premium, and special standardised furniture was designed to make optimum use of it. The kitchens were only 3.5 by 1.9 metres and were fitted out with workbenches, movable lighting, an adjustable stool, fitted cupboards and a foldaway ironing board.

Ideas about the efficient use of space in the servantless kitchen, treating the workplace like a factory, had made an impact during the early 20th century with Christine Frederick's book on household management entitled *The New Housekeeping*, published in New York in 1913 and Berlin in 1922. The notion of the pre-fabricated, modular kitchen serving as a labour-saving work station for the professional housewife gained momentum in the 1930s. In wartime Britain the mass-produced, modular kitchen was installed in the thousands of pre-fabricated houses, built to deal with the extreme housing shortage. An example of the first fitted kitchen to be manufactured in Britain is now displayed in London's Science Museum. The kitchens were designed by German émigré, George Fejer, who went on to work as a consultant for Hygena in 1953. The kitchen units he designed were based on a modular system whereby the units could be assembled and fitted conveniently into the kitchen. The early, pre-fabricated kitchens had been made from aluminium and metal due to a wartime surplus of these materials. By the later 1950s Fejer was designing wooden carcasses with plastic or wood facings. In terms of more recent interior design, the trend for mass-produced, flat-pack furniture has made an impact on most

areas of the private dwelling. The bathroom, bedroom and living space may now all feature some home-assembled storage device.

The High-Tech movement in interior design also drew its inspiration from the aesthetic of mass production during the 1970s. Steel scaffolding, office furniture and factory flooring were introduced into the domestic interior. The architectural work of Richard Rogers fits into this genre, particularly the Pompidou Centre, Paris (1977) and the Lloyd's Building, London (1978–86). The book, *High-Tech: The Industrial Style and Source Book for the Home* published in 1978 by Joan Kron and Suzanne Slesin described exactly how the High-Tech home could be assembled from mass-produced objects ordered from trade catalogues. Habitat marketed an all-black, minimal furniture range in the 1970s, which was also christened high-tech. During the 1980s, with the impact of environmental concerns, there was a reaction against the industrial aesthetic. A trend towards recycling emerged whereby British designers such as Ron Arad used salvaged car seats for chic chairs in 1982 and rusty metal and rough concrete for his shop, Bazaar in London, designed in 1984. Such design has been termed "post-holocaust", as it evokes the spirit of a decaying world. The exciting prospects offered by mass production, which were so inspirational for the Modern Movement have now been discredited. In the late 20th century the craft aesthetic as applied to the design of interiors has never been more powerful.

Maugham, Syrie 1879–1955

British interior decorator and furniture dealer

Celebrated as the champion of the all-white interior, Syrie Maugham was one of the leading British interior decorators of the 1920s and 1930s. She was born the daughter of Dr. Thomas Barnardo, the Victorian philanthropist and founder of the Barnardo children's homes, and spent much of her early adulthood travelling in North Africa, Europe and North America. In 1901 she married Henry Wellcome, whom she had met in Khartoum, and the two settled in London. The couple divorced in 1916 and the following year she was married for a second time, to the novelist Somerset Maugham whom she divorced in 1927. Despite the scandal of her private life, she was rich and well-connected, and, like her contemporaries

Maugham: drawing room, 213 King's Road, Chelsea, 1933

Elsie de Wolfe and Lady Sybil Colefax, she occupied the role of “lady” decorator serving a fashionable and aristocratic clientele that included the Duke and Duchess of Windsor, Lady Rothschild, Noel Coward, Mary Pickford, Tallulah Bankhead and Paul and Ava Mellon.

Maugham’s interest in interior decoration began shortly before her second marriage. In 1913 she engaged Ernest Thornton-Smith to decorate her house in Regents Park, and was so impressed by the results that she asked to join him at Fortnum and Mason, where he worked, to learn the craft of furniture decoration and the basics of decorating. She established her own interior decorating business, Syrie Ltd., at 85 Baker Street, in late 1922. The stock consisted of old furniture purchased from antique markets, that she stripped and redecorated with brightly-coloured, floral stencils, creating pieces that were similar to those produced by the Omega Workshop before it closed in 1919. From the very beginning of her career she also used her own houses as adjuncts to the showroom, moving furniture and accessories as appropriate and entertaining clients at home. And it was at her house, 43 Bryanston Square, that she created her first all-white drawing-room in 1923.

The business was successful and moved to larger premises on the corner of Grosvenor Square and Duke Street in 1924. In 1925, she took up residence at 213 Kings Road, Chelsea, where she created her most celebrated white rooms, and later that same year she opened her first shop in the United States, in partnership with Elizabeth Arden, at 1913 North Michigan Avenue, Chicago. Another shop at 20 East 87th Street in New York soon followed. These shops sold furniture, textiles, paintings, lighting and ornamental objects. Syrie herself rarely designed any of these items but she was an inspired stylist. White, in varying tones and textures, was central to her taste and she created elegant interiors mixing 18th-century French furniture and Regency styles with elements of the Moderne and light colours. She also created the fashion – known as “pickling” – for stripping antique chairs and tables of their original dark polish and finishing them with light paint or wax. And she commissioned rugs, furnishings and murals from contemporary artists and designers such as Marion Dorn, Oliver Messel and Christian Bérard for her interiors.

Her style is exemplified in the influential “All White” drawing-room that she created for her Kings Road house in the late 1920s. Maugham has often been described as the originator of the all-white scheme, but in fact other decorators such as Basil Ionides were also decorating in this style, and the Chelsea interior was probably the only pure-white room that she ever created. Nevertheless it was greatly admired and exercised an important influence on fashion photography and Hollywood film sets during the inter-war years. It contained white and cream upholstery and walls, white satin curtains, and a creamy-white abstract rug by Marion Dorn. The room also featured three Louis XV chairs painted off-white, a white plaster still-life made by Oliver Messel, and a large, modern, mirrored screen. A similar screen was made for Mr. and Mrs. George Hay Whigham in Upper Grosvenor Street and is now in the Victoria and Albert Museum. Others were even more spectacular, and at least one, designed for an American client, featured a panoramic view of Chicago superimposed upon the mirror.

Maugham produced several other all-white interiors, including a bedroom for Mrs. Tobin Clark at a house designed by David Adler in San Mateo, California (1930). But many of her clients preferred the peach and beige tones used in her Villa Elisa to sparkling white. The Villa Elisa, named after her daughter by Somerset Maugham, was at Le Touquet, France, and was her summer home for many years. It was illustrated in *House and Garden* in 1927, the year that it was built.

Not surprisingly, Maugham’s wealthy clients often wanted to combine the Syrie style with family heirlooms and solid and quite traditional furniture and textiles, and her work sometimes ended up resembling that of her rival, Sybil Colefax. Alternatively, it could result in an extremely diverse and eclectic effect. For example, Maugham’s work for the Hay Whighams in the 1930s ranged from a dramatic Moderne bathroom containing a wall of mirrored glass, a green bath with gold fittings and sheepskin rugs on the floor, to a traditional dining room with “pickled” pine-panelled walls and four heavy Regency dolphin consoles in mahogany.

Although many of Maugham’s most well-known schemes had white or plain walls, her all-white period was actually quite short-lived. By 1933, she had abandoned this style for a blue one, followed by a red one, and she became increasingly interested in figured wall coverings. She used a particularly fine Danish damask wallpaper for Mrs. Tobin Clark’s New York home, Burlingame, which she decorated in 1930, and in one of her own houses, The Pavilion, Kent, every room was hung with brightly coloured patterns. Indeed, she recommended colours for those without gardens and she imported papers and friezes from France and had designs made up for her by the respected London firm, Cole and Sons.

After World War II, Maugham worked mainly in the United States. She collaborated with the New York decorator John Gerald, and ran a business importing paintings by artists such as Augustus John and Glyn Philpot, rugs by Marion Dorn, and lamps by Giacometti. One of her last major commissions was Mrs. DeWitt Wallace’s house, The Castle, in Mount Kisco, New York, which she decorated between 1946 and 1952. The elegance of her eclectic taste continued to be appreciated by a small but discriminating group of clients, and her all-white look strongly influenced the interior designer Michael Taylor’s “California look” in the 1960s and 1970s.

JANICE WEST

Biography

Born Gwendoline Maude Syrie Barnardo, in London, 10 July 1879, the daughter of Dr. Thomas Barnardo, philanthropist and founder of the Barnardo Homes. Married 1) Henry Solomon Wellcome, 1901 (divorced 1916); 2) novelist and playwright W. Somerset Maugham, 1917 (divorced 1927): 1 daughter. Trained under Ernest Thornton Smith, head of Fortnum and Mason’s antiques department, from 1913; opened her own interior decorating and furniture showroom, Syrie, 85 Baker Street, 1922; moved to Grosvenor Square c.1924; pioneered “all-white” interiors during the 1920s; by the mid-1930s, had shops in London, Chicago and New York. Business went bankrupt in the 1940s; Maugham continued to deal in paintings and decorative arts and executed a few commissions in the early 1950s in America. Died in London in 1955.

Selected Works

Syrie Maugham decorated numerous interiors in Britain and America in the 1920s and 1930s. Her clients included Noel Coward, Tallulah Bankhead, Stephen Tennant, Clare Booth Luce, Ava and Paul Mellon, Mary Pickford, and the Duke and Duchess of Windsor. Many of these schemes are illustrated in contemporary magazines, particularly *Vogue*. Examples of her furniture and screens are in the Victoria and Albert Museum, London, and the Brighton Museum and Art Gallery.

Medieval Interior Design

Northern Europe

Before discussing medieval interiors in detail, it is necessary to survey, however briefly, the peculiar pressures and priorities which bore upon society, for interiors and their furnishings were concerned with estate or honour and were not assembled to gratify personal taste, which in our own day has become such a significant factor in selection. Great lords maintained and enhanced their position by conspicuous show, and the extravagance of their courts was a necessary price of their survival. To this end they were visible and available, and privacy, as we understand it, was both impractical and undesirable. Georges Chastellain (d. 1475), historiographer to two dukes of Burgundy, tells us that "after the deeds and exploits of war which are claims to glory, the household is the first thing that strikes the eye and which it is, therefore, most necessary to conduct and arrange well".

Large numbers of persons from all walks of life thronged medieval courts and had to be regulated and controlled by offi-

cialists who kept order and punished unsocial behaviour. A 15th-century courtesy book tells us that "the marshal hath power to correct all such as commit great offences within the house or without, as in fighting, horrible chiding, making of debates, drawing of knives and stealing, affrays and such other: to put them into the Porter's ward, or in the stocks". In such hazardous circumstances, rooms were fitted out on a daily basis, according to the lord's projected activities, for grand display was dependent upon his presence. Valuable possessions (e.g., plate and jewels, clothing, chamber textiles, books and special furniture) were stored in secure wardrobes, under the care of designated household officers, to be released and returned as required. In this context, wardrobes were not cupboards but chambers of many sizes, which might be large enough to accommodate the workrooms of tailors, upholders and seamstresses, as at the Château de Pierrefonds, France, in the 15th century, and the Tower of London in the reign of Edward III.

The necessary fluidity of valuable belongings lent itself to formulae denoting degrees of estate which suited the stratified nature of courtly society. Throughout the period, even as feudal ties disintegrated in the later Middle Ages, seigneurial lords turned with almost obsessive concentration to the increasingly complex rules of etiquette which were manipulated to give visual expression to political aspirations. French was the courtly language, and France was the creative force of courtly manners, as Alienor de Poitiers, writing in the court of Burgundy in the 15th century, makes plain. However, the Burgundian court, so important in this survey, became a more influential interpreter of courtly ceremony in the 14th and 15th centuries than France herself, and the English court, owning French lands and allying itself with the Netherlands, shared the same courtly usages. All society took its cue from the habits of the court, which became the language of wealth as well as of political power.

While every aspect of the interior responded to a myriad of references to the persons whose presence was celebrated at a particular time, whether by colour scheme, ornament, quality of hangings or of precious plate, it was the *form* of each article which was of first importance and which proved the most enduring element in the arrangement of medieval dwellings.

The suspended canopy above bench or chair, platform of audience, bed, or even bath, and the buffet with its burden of gold, jewelled and silver vessels (both covered – with lids – for especial honour, as well as uncovered) set on shelves whose number signified degrees of precedence were, by the 14th century, primary symbols of estate. They were potent symbols, being recognizable in an age when large numbers of persons were illiterate. And because the language of symbolism was concerned with precedence which is mutable, rather than rank which is fixed, it was capable of subtle adjustments. Thus we find that the King's Steward, in the absence of the sovereign, took precedence over all other persons at court including royal princes; yet, in the King's presence, the Steward fell behind. And similarly princes, in their father's court, deferred to him by using beds with half canopies which oversailed part of the sleeping surface, instead of using the grandest beds of state with canopies of the same size as the bed beneath, which they used in their own households. And so on, down the scale, each man of even modest social pretensions displaying some of these

Medieval: *Annunciation* by Rogier van der Weyden (c.1399–1464), showing state bed with canopy, chimneypiece with candle sconce, and tiled floor

symbols of lordship within his own dwelling, if he could afford to do so. Thus we see courtly usages portrayed in many Flemish panel paintings where the typical setting is a comfortable and secluded apartment of a type enjoyed by the rich merchant class.

Turning to the development of town houses and palaces, country manor houses and castles, the hall provided the focus where all men met, and from the simple, early hall of the 11th century ancillary chambers and offices grew. Early halls were at first floor level, as we see from the 11th century Bayeux Tapestry surviving at Bayeux, Normandy, showing Harold of England feasting at his manor of Bosham (Sussex), and in the 12th century at Framlington Castle (Suffolk), also in England. Such halls had wall fireplaces and chimneys.

The alternative ground floor hall, often over a basement or undercroft for storage, had gained ascendancy in England by the 14th century, though in France and the Netherlands the first floor hall held its own in popularity. A typical hall arrangement comprised a barrier or screen at one end, behind which lay the service quarters (buttery for drink storage, pantry for bread, and the kitchen complex) and at the opposite end the lord's dais and table, with access beyond to the solar, properly called the great chamber, and further quarters for the lord and his family, which might occupy several floors. Plans of castles provide the most varied arrangements in accommodation, and being politically significant, were designed with considerable sophistication by the foremost architects of their

day, though we are never able to identify the uses of every chamber.

Early ground floor halls were typically single storey, with high timber roofs to disperse the smoke from central hearths. Timber roof construction was not yet sufficiently advanced to cover a wide hall in a single span from wall to wall, and posts (and aisles) or arcading were employed in the larger enterprises. The aisled hall, built in the royal castle at Winchester, Hampshire, between 1222–35 survives, and the great hall at Westminster Palace, London, measuring 239 feet by 67 feet 6 inches, was also triple aisled in its 11th-century form. A central hearth was the only practical way to heat these divided spaces, and louvred turrets in the high roof, manipulated by cords, controlled the smoke. Such wooden turrets became elaborate and ingenious exercises in carpentry and were sometimes retained as natural light lanterns, after wall fireplaces made them otherwise redundant.

Advances in roof technology were an English phenomenon, and its supreme outcome was Hugh Herland's late 14th century remodelling of the roof of the hall of Westminster Palace, with its spectacular hammer beam construction embellished with rows of carved angels, making it the finest surviving example in Europe. This sophisticated development transformed the aspect of the hall. Wall fireplaces could heat the single space with efficiency, obviating the need for a central hearth; the whole hall could be viewed without interruption from the dais, giving the space a new unity and visual magnificence; and, with chimneys, a high roof was no longer necessary, leaving the way open for a room above, if required. Such changes were adopted gradually, according to circumstances, and the siting of the wall fireplaces, and their number, varied. A fire behind the dais was favoured in France, and was even combined with a central hearth in the mid-13th century at Peverill Castle, Derbyshire.

Extracts from two descriptions of the same feast at Bruges in 1468, given to honour the marriage of Elizabeth of York to Duke Charles the Bold of Burgundy, show how halls were used on the grandest of occasions.

... over the high table for its whole length and more was cloth of gold and a royal canopy of richer cloth of gold ornamented with the Duke's colours of purple and black with a fringed valance. The walls were hung with rich tapestry made in Arras which illustrated the Bible story of Gideon. There were two hanging candelabra giving equal light. Each was fashioned like a castle upon a rock, the latter marvelously wrought of what appeared to be precious stones. Each candelabrum had glass mirrors in which the crowd of diners, and their faces, appeared, and there were eight candles to each side; and seven other candlesticks, each with four lights, were around the rest of the hall. The roof of the hall was covered with striped white and blue cloth.

(quoted in *Furniture History* XIII, pp.255–26)

... In that hall were three laid tables of which one was at the end and above, placed crosswise: and this was the table of honour or High Table. This table was approached by steps, and extending its whole length was a sumptuous canopy and seat back so large that it made a covering for the seat itself as well, all of the richest

cloth of gold. At the two sides of the hall set lengthwise were the other two tables, set and laid, exceedingly fine and exceedingly long; and in the middle of the hall was a high and sumptuous buffet, made in the form of a lozenge. The upper part of the buffet was closed with a barrier, and the whole was covered with tapestry and hung with the Duke's arms, and in front began steps and risers furnished with vessels, and at the lowest part of the buffet were the largest vessels and about the highest part were the most sumptuous and the most delicate, that is to say that at the lowest level were large silver-gilt vessels and at the highest were the gold vessels, set with precious stones and of these there were a very great number ... About the angles of the buffet were unicorns' horns, large and complete. And none of the vessels with which the buffet was garnished were used that day, but there were other silver vessels, pots and cups, and it was with these that the hall and chambers were served that day, and in truth the Duke of Burgundy was able to serve his feast well and generously because his father left him provision of over 60,000 marks of plate, worked and ready for use.

(quoted in French in *Furniture History* XIII, pp.253–24)

Regarding the unicorns' horns, these were generally narwhal horns and were, of course, extremely rare in the Middle Ages.

Hall tables were generally heavy boards, resting by weight alone on trestles which meant that the space was easily cleared after dining. Stools and forms were the usual seats below the dais, though at special feasts where ordinary folk were excluded, such as the one described above, all tables might be occupied by persons who qualified for a certain degree of honour and benches (with back rests) and table cloths, as used at the dais table, would be provided. The lord, who sat in the centre of the dais table so that he could control the feast, and be visible to those who enjoyed his hospitality, had a high backed chair by early tradition, though in the later Middle Ages a shared bench with footrail became fashionable. (This is clearly shown in a miniature of the Duc de Berry dining, in the *Tres Riches Heures* in the Musée Condé, Chantilly.)

The canopy, slung by means of cords from the ceiling beams, generally oversailed the lord's space alone, though on special occasions, as at the marriage feast at Bruges, honour was shared with all at the high table. Seating was confined to the back of this table, so that the front was free for service, and for preserving a clear view both up and down the hall. A buffet for wine service stood near the dais, and stepped buffets (like the lozenge-shaped buffet mentioned above) of varying numbers according to the size of the feast, were positioned down the hall. Where the vessels and dishes were especially vulnerable from passing servants, the shelves were arranged quite high, and were also protected by barriers. Food was arranged at a hatch or on a dresser outside the hall before being carried with considerable ceremony to the dais. Minstrels and musicians formed part of the pageantry of the great feast and were sometimes accommodated in open galleries above the hall.

The great chamber, with the hall and household chapel, was architecturally the most ornate area in the lord's court. It devel-

Medieval: bedchamber from a French illuminated manuscript of *Le Roman de la Rose*, c.1460, showing bed with half canopy, and wallhanging suspended by hooks

oped into a suite of at least three rooms, and at great courts similar suites were provided for the lord's lady, and for distinguished visitors. The suite was used for entertaining, for private dinners and for receiving select company, and its furnishings were luxurious. Though the first room might contain a large canopied or state bed, this was symbolic and was occasionally used by the lord as a seat. The next room was the bed chamber, containing another state bed which was, this time, for use, and often a wheeled couch with a circular or *sparver* canopy. A private chapel, which was typically an area screened off with curtains, was either in the first room, or here in the bed chamber. (A great many vestments were kept for private masses here, and in the larger household chapel, which, with chamber hangings and plate, were among the most precious possessions in daily use.)

Beyond this room lay the *retrait* or wardrobe, where the lord's body servants attended to his toilet and where especially comfortable padded furniture was to be found. The lord's night stool was here; privies generally gave off this and other rooms of the suite. The following extract from an account of the entertainment provided at the royal court at Windsor Castle for the lord Gruuthuse of the Netherlands in 1472, shows how such suites were furnished in individual circumstances.

And at about nine of the clock, the King and Queen, with her ladies and gentlewomen, brought the said lord Gruuthuse to three Chambers of Pleasance, all hanged with white silk and linen cloth, and all the floors covered with carpets ... There was ordained a bed for himself of as good down as could be thought, the sheets of Rennes, also fine fustian, the counterpoint cloth of gold furred with ermine, the bed back and the canopy also shining cloth of gold, curtains of white sarsenet ... In the second chamber was another bed of estate, the which was all white. Also in the same chamber was made a couch with feather beds, hanged with a tent knit like a net; and there

was the buffet. In the third chamber was ordained a bath or two, which were covered with tents of white cloth. And when the King and Queen had showed him these chambers, they turned again to their own chambers and left the said lord Gruuthuse there accompanied by my Lord chamberlain ... which both went together to the bath ... also there were those servants belonging to their chambers. And when they had been in their baths as long as was their pleasure, they had green ginger, divers syrups, comfits and hippocras, and then they went to bed.

(quoted in C.L. Kingsford, *English Historical Literature*, Oxford, 1913)

The baths mentioned here would have been large wooden tubs with linen sheets spread to entirely cover the wood and make them comfortable to the bather.

Window and door headings developed from the round-headed Romanesque through pointed and ogee forms to the flamboyant style of the 15th century, in common with church architecture. Traceried roundel windows were common, particularly in gable walls, from as early as c.1090 (e.g., at Chepstow Castle on the borders of Wales), and stone window seats, often set in splayed jambs with raised footrests, were favoured from the late 12th century. In 1378 the Duke of Burgundy ordered such seats to be lined with wood in his great chamber in the Château de Montbard: "pour cause de la pierre qui estoit trop froide ...".

Projecting oriel windows became fashionable from the late 13th century, and the resultant slanting shafts of light from the angled windows gave a particular beauty to a room. External and internal window shutters had long provided protection and warmth, and the added luxury of glass windows was commonplace in the grandest contexts from the mid-13th century, as we discover from the numerous orders for improvements flowing from that indefatigable builder, Henry III of England. A few examples are instructive: 1241, at Winchester Castle, two glass windows to open and shut to be made in the King's chamber opposite his bed. 1231, at Nottingham Castle, glass windows to be made in the Queen's chamber ... and a round glass window before the door of the King's chamber. 1252, at Northampton Castle, plain glass windows to be made for the windows next to the entrance of the Queen's chamber ... and to paint the story of Lazurus and Dives thereon. 1272, at Oxford, wooden windows to be made over against the glass windows, lately ordered for the King's chapel and buildings at Oxford, for their preservation. The records of the Duke of Burgundy's household for 1375 contain orders to mend the glass windows at the Château de Rouvres in the green chamber where the Duke slept; the chapel; and the four windows in the room of the Duke's son, Jean.

Windows might have glazed heading with shutters beneath and, for lesser individuals, waxed or oiled cloth or horn provided an alternative to glass, for just as ornamentation within great houses was confined to areas where estate was relevant, so glass windows were allocated according to degree. Thus in 1372 the Duke of Burgundy ordered that Jean de Marville, a sculptor accommodated in the ducal palace at Dijon, be provided with one and a half yards of varnished cloth to cover the window of his room. However, by the 15th

Medieval: Flemish illuminated manuscript illustrating the Court of Alexander the Great, with Alexander in state under a looped canopy, and showing a stepped buffet and tiled floor

century, the middle classes, as well as the nobility, commonly enjoyed the refinement of glass windows, as we note from the lease of a house in London rented to a rich Venetian merchant in 1485. Surviving 15th-century oak shutters from merchants' houses at Ghent, of the kind that fronted glass windows within rooms, are displayed at the Bijloke museum. They have concertina hinges, elaborate iron catches and are carved with linenfold. References to window curtains are elusive, though an entry for "curtains for the great bay window in the Queen's old chamber in the wardrobe", occurring in the Privy Purse Expenses of Elizabeth of York for 1480 shows that they did exist, though it is highly likely that the common use of interior shutters made curtains largely superfluous (see N.H. Nicolas, London 1830).

Early wall fireplaces were sometimes arched in Romanesque fashion, but as early as the late 12th century they were hooded (e.g., at Conisborough Castle, Yorkshire), a development which produced dramatic pyramidal canopies which often continued in a gradual taper up to ceiling height. Angled corners produced convenient ledges for pricket candles set behind protective upstands, while in the 15th century panel paintings show delicate swinging iron brackets attached to the front of the hood. Candles were beeswax, or tallow in service quarters. In the 15th century, plain fireplaces often had four-centred arched headings, and elaborate carving became widespread.

Remarkable examples of extravagance survive in the house of the magnate Jacques Coeur, at Bourges. Begun in 1443, this extraordinary palace is full of intricately sculptured ornament

which, though thoroughly restored in the 19th century, retains the character of the original. One chimneypiece is carved with three pairs of figures sitting at three windows, as if observed from the street, while another resembles the façade of a castle. Hearths might be neatly blocked with studded infills during inclement weather.

Permanent floors were of earth or wood, mortar or plaster, paved with stone, cobbled or tiled. Floors of tamped chalk or of other available soils continued in use into the Renaissance, and were strewn with rushes, sweet smelling herbs, or flowers. Though doubtless earth floors in the halls of manor houses of the poorer knightly classes were retained of necessity, they had their uses in grander circumstances, as, for instance, where jousts or other sports took place in the hall, as happened in 1446 at the Duke of Burgundy's palace at Brussels. There were also occasions when pageantry at feasts involved riding to the dais, as, once more, at the court of the Duke of Burgundy during the Feast of the Pheasant at Lille in 1454.

Large quantities of earthenware floor tiles decorated with white pipeclay infill beneath a lead glaze were manufactured at many kiln sites, the great majority using the humble clays of individual regions, in parallel with traditions formed in the manufacture of utilitarian pottery vessels. Some were monochrome, and those with inlay were, with notable exceptions, of a vigorous but rustic character. Though floors were their usual destination, they were also used on walls. The formative period of development lasted from the early 13th century to the end of the 14th century; thereafter the highly finished, impersonal style of geometric paving, so eloquently delineated in Netherlandish panel paintings, suggested new priorities.

These earlier tiles were used in royal palaces, manor houses, churches and institutions alike and some have endured *in situ* (for example, in the medieval treasury called the *Aerary* of St. George's Chapel, Windsor). In domestic contexts they were not confined to rooms of state, though the grander the location the more varied and interesting the tile design tended to be. In England, Henry III was using tiled floors in 1250 for the Queen's apartments at Clarendon Palace, Wiltshire, and the pavement excavated from this site can be seen in the British Museum. The incomparable pavement of *cosmati* work installed by Henry in 1268 at Westminster Abbey (which survives in the Presbytery but is rarely uncovered owing to its fragility) is recorded as laid by the mosaic worker Odericus and is of entirely different character, not only in its constituents which are porphyry, marbles and glass tesserae but also in its inspiration drawn directly from the antique and imbued, as the inscription upon the pavement indicates, with esoteric meaning. There is no record of Henry using *cosmati* floors in any of his palaces, and it is doubtful if anything other than earthenware tiles of Gothic inspiration were used domestically.

While the Clarendon pavement is entirely heraldic and geometric in design, finds from Chertsey Abbey, Surrey, believed to have been re-used from one of Henry's palaces, comprise two groups of considerable mastery and sophistication. One group depicts Richard I fighting Saladin, and the other illustrates the *Romance of Tristram*, all dated c.1250-70 and preserved in the British Museum. The usual colours for lead glazed tiles were red, golden brown, yellow and olive green. A few surviving tiles from the Château de Beaute, built by Charles V of France in c.1373-75, are similar to English

tiles of the previous century, but the examples from the Château de Germolles of a sheep under a tree and a hawthorn branch respectively, though stylistically straightforward, indicate that at the end of the 14th century one decorative scheme could govern the whole of an interior, in circumstances where the patronage of powerful princes attracted the service of the greatest artists of the time. (See *Les Fastes du Gothique*, Grand Palais, Paris 1981, Cat. 363 A, B.) In late 14th century contexts, tin glazed tiles were found at sites associated with the brothers Jean, Duc de Berry and Duke Philip the Bold of Burgundy. This technique allows a palette of brilliant, clear colours and a true white to replace the softer, more muted tones of the lead glaze tile range, and a further development occurred in the arrival of blue on tin glazed tiles, a colour hitherto only associated with Spain (see *Les Fastes ...* Cat. 362).

Whereas the treatment of walls in service quarters responded to purely utilitarian considerations, additional factors came into play in those areas where estate was advertised. Rough surfaces were unacceptable, and stone was plastered, even to the window reveals, before being treated with a white or colour wash. Though inevitably colour will receive more attention in this survey, the importance of white throughout the medieval interior cannot be over-emphasized. Though white, with all colours, shared in the language of symbolism, its visual brilliance and its practicality as a reflector of light, ensured it remained of paramount importance. Wall paintings dominated interiors during the 13th and 14th centuries, and for these the finest base was gypsum plaster, readily available at Montmartre near Paris.

The paintings at the Palais des Papes at Avignon are supreme examples of the French secular style of wall painting, and were painted in 1343 for the bedroom and study of Clement VI. The bed chamber, with corner chimney, is painted with a curtain pendant from rings beneath a formal border at the lowest level, and above it rises a large expanse of vine scroll upon an azure background, inhabited by many birds with distinct and brilliant plumage. The study walls, in contrast, illustrate forms of hunting, with many figures in a forest of slender trees and precisely observed forest flora. These exquisite rooms, unlike the generality of surviving English work which is characterized by fragmented subjects of varied scale, project overall schemes so that the onlooker stands enveloped in the particular world of the artist's imagination. However, a fragmentary composition in Byward Tower, Tower of London, is an outstanding example of English work of c.1390, and shows that at the highest level of patronage comparable levels of sophistication were achieved on both sides of the Channel, though the inspiration for each example is of a very different character.

Both Charles V of France and Henry III of England commissioned elaborate history paintings for walls, which do not survive, and at a simpler level Henry delighted in a scheme of green spangled with gold, using this design at many of his palaces. In 1256 at Guildford, Surrey, his chamber had a green ceiling spangled with silver as well as gold, combined with white walls painted to imitate masonry. Indeed, sham stonework seems to have been another favourite, and in the chamber of Henry's Queen in the Tower of London the delineations formed frames for flowers, whereas at a later date Mahaut, Comtesse d'Artois used sham masonry painting at the

Château d'Hesdin, together with blue or green ceilings with metal stars. (Where Henry III's gold stars were on wooden wainscot at Clarendon, excavations found that they were of gilded lead.)

By the 13th century, wainscot was a popular way of providing greater warmth and comfort. Until the 15th century it was generally devoid of architectural detail and provided a flat surface for painted decoration. Deal imported from Norway was commonly used, though oak is recorded and special woods were also employed, as in Charles V's library in the Louvre which was boarded with bogwood and cypress. Sometimes fitted seating was incorporated in the wainscot as, for example, at Nottingham Castle, England, where instructions were given to wainscot the King's chamber and to "make wooden stalls and chairs round about". Vaulted ceilings might also be wood lined, as is often depicted in manuscript illuminations, and was the case in Charles V's great chamber at Vincennes. Linenfold panelling appeared in the Netherlands in the second half of the 15th century, yet made little impact in either France or England until the 16th century.

During the 14th century fashion started to favour hangings of various silks, tapestry and worsted, in place of painted walls, as greater quantities were manufactured in Europe. Hangings were suspended on simple hooks allowing for easy mobility. The quality of all chamber textiles responded to rules of precedence, and stained cloths were widely used where appropriate, providing cheap and decorative wall hangings. Cloth canopies continued to be indispensable. They frequently belonged to matching sets of chamber textiles, and were either long strips hung vertically, looped forward at the required height and caught with ceiling cords, or tailored rectangles with valances, kept to their precise form by means of iron rods hooked together, hidden in cloth channels, and once more suspended on cords from the ceiling. A third form was the sparver which resembled a bell tent. All canopies were entirely demountable. In the great chamber and its ancillary rooms carpets provided the final luxury on special occasions; floor carpets were introduced into England from Spain, when Eleanor of Castile arrived in 1255 as the bride of the future Edward I.

An inkling of the sumptuous nature of hung chambers can be gleaned from a few survivors, e.g., the French 15th century *La Dame à la Licorne* tapestries in the Musée Cluny, Paris; and the 15th-century Netherlandish tapestry of the court of Philip the Good, Duke of Burgundy in the Burrell Museum, Glasgow, which together exemplify works from the two greatest areas of production. For chamber hangings using silks and embroidery we have to be guided by ecclesiastical textiles, remembering that the chapel was a major area of lordly display with heraldry the principal source of ornament, and for this group the Musée des Tissus at Lyon has fine collections. Delicate linens for bed and bath, and napery for tables and buffets, were essential adjuncts of courtly living, as were the quantities of precious plate displayed on buffets, and since usury was denied to Christians, plate was the highly visible bankroll of all men of wealth. A lonely survivor of this once great store of gold embellished with jewels is the French Royal Gold Cup given to Charles VI of France in 1391 (British Museum); while the Burghley Nef, made in Paris by Pierre le Flamand in

1482–83 (Victoria and Albert Museum, London) survives from a somewhat larger group of medieval silver-gilt secular plate.

In general, furniture was solid and durable, designed to resist the rough usage encountered in the daily life of households, and since a transformation could be achieved by covering surfaces with textiles, most requirements were satisfied. However, from early times a few items of furniture used by seigneurial lords was elaborate, delicate and costly. Theophilus, a monk writing in early 12th century Germany, mentions engraved and silvered copper sheets attached to painted chairs, stools and beds. Evidently this technique endured, for the Duchess of Suffolk had such a chair, covered with blue cloth, with panels of copper, in 1466; in addition, the Duchess's chair had a case for its protection. Most special furniture was destined for the chapel, or the lord's great chamber suite. Many upholstered chairs for the *chambre de retrait* (or wardrobe) are recorded, like the one made by a saddler for the Duke of Burgundy in 1390, padded with down and supplied with its own case. Orders for inlaid wooden tables, gilded chests, state cradles, and furniture adorned with sculptures, precious finials and painting were all commissioned from the finest artists and craftsmen of the day, though only a few documented examples have survived, most of which are disfigured, like the so-called Coronation Throne presently in Westminster Abbey, made in 1300 by the King's Painter, Walter, and, as a piece of palace furniture, supplied with its own case.

Apart from the main areas of lordly display, there were other rooms of specialized use which may be mentioned. "Dancing chambers" existed. John of Gaunt, Duke of Lancaster, had one at Kenilworth Castle, Warwickshire, in 1379, having two wall fireplaces, traceried windows and a special floor, and another is recorded at Clarendon Palace in 1385.

The formation of private libraries grew rapidly in the later Middle Ages. Seigneurial lords and rich merchants alike acquired romances, in addition to the devotional works which had hitherto dominated collections. Books were stored in chests and armoires, and bibliophiles took to installing libraries and studies. Charles V of France had several, and Henry IV of England ordered an elaborate study at Eltham Palace, Kent, with seven glazed windows and 68 roof bosses carved with angels. It was equipped with two desks, the larger being of two stages "to keep the King's books in". Numerous illuminations show that many desks were ingeniously fitted and had large slopes to support substantial volumes, while canted shelves fitted to the wall supported other books within easy reach of the scholar's seat. Precious devotional books were laid on cushions on prieu dieus, to protect vulnerable bindings. Duke Philip the Bold's special books had individual leather cases, and were stored in fitted armoires in his exchequer suite, along with his administrative documents which were kept in cloth bags. As has been noted, storage in wardrobes and secure offices was normal for all possessions of value, and the Queen of France took a reading desk and two folding tables to eat at, inlaid with ebony and ivory, out of the wardrobe in the Louvre in 1317.

Excavations show that in the 11th and 12th centuries kitchens were insubstantial structures, often wood framed, set apart from the main house. Indeed, throughout the Middle

Ages anything other than a tenuous link between dwelling and kitchen was resisted, with only a prentice or at best an enclosed passage between two separately roofed structures. From the 13th century the preferred shape was a square, typically with the corners cut off within to accommodate vast fireplaces. Henry III built two at Clarendon Palace, one of 42 foot square, and the abbey kitchen at Fontevrault of c.1195 had five fireplaces within its octagon. Such buildings were magnificent, with stone floors, high vaults with windows and louvred lanterns housed on bronze seatings which were turned by cords to control the draught to the great chimneys. Sculleries and salsaries were part of the kitchen complex, and sometimes the whole provision formed a separate court.

Baths were normally taken in large, portable tubs and used in the *chambre de retrait*, or wardrobe. They resembled coopers' barrels, might be large enough to take a stool inside, and were padded or draped with cloth for comfort; where appropriate, canopies were provided. In 1403 Princess Margaret of Flanders had two tubs padded with 64 yards of white cloth, complete with red cloth canopies. Proper bathrooms existed in great palaces. The King had one at Westminster in 1275 with drainage, and cold water issuing from gilt bronze taps in the form of leopards' heads, and by 1351 hot as well as cold water was laid on. In 1325 the Westminster bathroom had a wooden tub with an oblong canopy of oak, a wooden partition before the tub, and stone paving beyond covered with 24 mats, while in 1368 the royal bathroom at King's Langley Manor, Hertfordshire, was large with ten windows.

Other refinements were painted tiles (20,000 for the bathroom in the Palace of Sheen, Surrey, in the 1380s), and large alabaster tubs at the court of Bruges in the 15th century. Often "bath houses" are mentioned, suggesting that, like kitchens, separate buildings were thought prudent for fear of fire from the boilers heating the water. They may also have provided facilities for the whole court, which was certainly an arrangement at the court of the dukes of Burgundy.

PENELOPE EAMES

Italy

Although medieval Italy had a thriving culture and economy, surprisingly little tangible evidence exists of contemporary interiors, much of it obscured by the desire for change stimulated by the Renaissance. Between the 12th and 15th centuries, the visual arts in Italy reflected the troubadour tradition and courtly qualities dominant in northern Europe. However, Italy's artists and patrons exploited the country's political and commercial stability to concentrate on extensive painted decoration applied to the structural elements of the buildings themselves. It was part of a courtly cultural display that boasted of wealth, power and, above all, permanence. In the more volatile North there was more emphasis on fluidity of possessions such as furniture, canopies, and carpets and textile wall hangings tended to take the place of painted walls.

Most domestic rooms were multi-purpose and while, until the Renaissance, privacy was of little concern, grandeur was a desirable commodity in the homes and civic buildings of the nobility. The addition of devices such as towers to relatively modest residences, such as those at San Gimignano in Tuscany,

Medieval: interior of Palazzo Davanzati, Florence, 14th century

signified the upward mobility of its occupants, often with impractical consequences as these embellishments were inclined to catch fire or to collapse.

The search for new ways to demonstrate wealth was directed indoors and to the lower façades of buildings, with fresh emphasis on doors, windows, and painted interiors. Contemporary sources show that items of domestic furniture already in existence, as in the North, included desks, lecterns, tables, beds, chairs, stools, shelves, drapes and lanterns. Painted mural decoration arose from the surface decoration of furniture, in particular the Italian *cassone* or wedding chests of late medieval workshops.

Symbols of identity and authority appear in all noble Italian interiors, ecclesiastical and secular, as they do in the *cassone*. The equivalent work in a church would appear in an altarpiece and in a palazzo as a *spalliera* painting – a board or cloth to cushion the backs of those seated against the wainscoting. In the 14th century benches had *spalliera* or high backs to them. More portable, and costly, were tapestries used to cover the upper portion of the wall. As permanence and conspicuous

consumption became desirable in domestic interiors, painting replaced tapestry and wall panels also came to be called *spalliere*. Like those of the *cassone*, subject-matter depicted narratives of morality or reflected the character of the patron. The first recorded reference to a *spalliera* painting not attached to an item of furniture was a panel made around 1431 for the Palazzo di Parte Guelfa in Florence.

One of the finest examples of the Italian medieval interior is the Palazzo Davanzati, now a museum, in Florence. An imposing three-storey building, it has undergone only minimal external and internal alteration since its construction in 1350. The triple-arched façade was probably originally crowned with ramparts, while in the 16th century a Venetian-style loggia was renovated out of the existing structure. Wall paintings remain remarkably intact. The ground floor is planned as a wide hall along the front of the building, facing an internal courtyard which provides a light-well for interior rooms. The hall, with its arched and barred windows, served also as a commercial space, with access to storerooms and the work space through the side wings and back of the building. Upper storeys echo the

floor-plan of the entrance level and, unusually, each storey has its own hall fronting the building rather than the single grand hall with adjoining smaller halls.

Near-contemporary frescoes painted by Ambrogio Lorenzetti (active 1319–48) in Siena's Palazzo Pubblico, provide further documentation of medieval buildings like the Palazzo Davanzati. The allegorical *Good and Bad Government* (*Buon Governo*), Italy's first great landscape painting, shows a piazza faced with shops under the arches of buildings, with small residential apartments above. The interior of the Palazzo Pubblico reveals much about contemporary treatment of interior spaces. Sadly, the room has been altered since its construction, suffering adjustments in proportions and overpainting of the frescoes.

Decoration of the walls in public spaces or in the semi-private spaces of palaces tended to follow ecclesiastical placing, slightly above eye level, as in Pisanello's unfinished and fugitive frescoes of a joust, a favorite subject of *cassone* paintings. The Sala del Pisanello was the entrance hall that led in to the reception room of Lodovico Gonzaga in Mantua. Interior space is manipulated – the viewer is invited into the room and even into the narrative of the decoration itself – but the distance between the reality of the painting and the wealth and power it symbolized, required the viewer to look up. As skills in perspective and accuracy increased, the placement of paintings higher up on the wall was seen as an opportunity to exploit technique. In the mid-15th century, the Florentine painter and master of perspective, Paolo Uccello (1397–1475) was commissioned to paint a series of *spalliera* panels for a bed chamber of the near-completed Palazzo Medici. The subject, the Battle of San Romano, is reduced to an intricate pattern of ground lines and vanishing points, to dramatic effect.

In the late 15th century the panels of the *spalliere* served as substitute windows, for example, intarsia panels in the Palazzo Ducale in Urbino, 1472. Surrounded by pilastered and carved mouldings, or *trompe-l'oeil*, these images were illusory openings at the level where light penetration would be expected. In 14th-century houses where there were real windows – and until the 15th century the need for fortification meant that few houses had windows – as in Northern Europe, they were seldom glazed. Less expensive than glass were *fenestre impannate*, a wooden frame covered with stretched, oiled canvas or linen.

Windows that did feature glazing consisted of glass lozenges (called *occhi* in Tuscany, *rulli* in Venice), traced with lead into a pattern with diamond shapes in the interstitial spaces. These too were filled with glass pieces, sometimes coloured to produce a dappled pattern. The window was framed in wood and fixed or hinged to facilitate opening. Vittore Carpaccio's painting of 1495 from the Legend of Saint Ursula, *The Dream of the Saint*, shows a bedroom with a glazed, shuttered window and low wooden latticed half-insert to act as screen.

Other than painted wall decoration, cloth was hung to cover the lower part of the wall. This helped to absorb sound and damp and to block drafts, and could be changed seasonally. The cloths were either decorated with a painted, repeated pattern, or executed to imitate verdure tapestry, called *panno arazzo* and often featuring coats of arms. The Master of the Upper Church of San Francesco at Assisi gives a beautiful

rendering of a room hung with such a cloth, or *spalliera*, in the scene, c.1300, of St. Francis appearing to Pope Gregory IX.

Less decorative methods of keeping out the damp included, from the late 15th century, wooden boards panelled roughly over the walls, as in the Camera de Asse (Boarded Chamber) of the Palazzo in Milan, 1493. Alternatively, the walls were plastered and paint could be applied in a plain or patterned coat, according to the owner's taste and budget. The lower registers of the walls of the Palazzo Davanzati are painted all over with coats-of-arms, much like a textile design.

Ceilings were generally of open beam construction, with the undersides of cross-beams usually left exposed and installed at close intervals. Occasionally some painting appears on the sides or undersides of the beams in lower rooms, with the images part of the general decorative scheme. Beams were seldom elaborately bossed but often met a more elaborate cornice or corbelled bracket at the joining point of the wall to ceiling. Coffered ceilings were rare until the end of the 15th century, although paintings show earlier examples of attractive panelled ceilings with carvings in the centre of each coffer.

Meissonnier, Juste-Aurèle 1695–1750

French architect, goldsmith, and designer of ornament and interiors

Juste-Aurèle Meissonnier's designs for architecture, interiors and gold were extremely influential in the creation of the Rococo style, especially in its later, fully developed phase, called the *genre pittoresque*. His designs rejected the use of classical symmetry in favor of sensuous, dynamic and three-dimensional expressions of nature. Although little of his work survives, a collection of 120 engravings, *Oeuvre de Juste-Aurèle Meissonnier* (c.1750) made from his drawings, indicated the diversity of his works, from firework displays, to ceiling paintings and gold snuff-boxes. Meissonnier was one of the first designers to create integrated interiors, combining painting, *boiseries*, and furniture to construct unified spaces. As Architect-Dessinateur de la Chambre et du Cabinet du Roi, Meissonnier worked closely with the French court, although some of his most notable designs were for foreign patrons in Poland, Portugal and England. Of the designs published in *Oeuvre*, most date from the 1730s and little is known of his earlier works. Only one of his architectural commissions survives, a house for Léon de Bréthous in Bayonne, France (now the Chambre de Commerce), from 1733. Several examples of his work in gold and silver, including snuff-boxes, candlesticks and a pair of soup tureens, are in European and American collections.

Born in Turin, Meissonnier was probably initially trained as a silversmith by his father who was a goldsmith and sculptor. Through his father, Meissonnier absorbed the latest artistic fashions, including extravagant Italian Baroque designs. By 1719, Meissonnier was working in Paris as a medalist, goldsmith and designer. In 1724, he received the highest official recognition as a goldsmith, Louis XV named him Orfèvre du Roi at the Manufacture des Gobelins. The same year he was elected to the Corporation des Marchands-Orfèvres-Joailiers as a *maître orfèvre*. Meissonnier did not gain his place in the

goldsmiths' guild through the usual means, but rather through royal patronage. In 1726 he was named Architect-Dessinateur to the court of Louis XV, a position he retained until his death in 1750. In this capacity Meissonnier designed court festivities, including royal firework displays celebrating events in Louis XV's life and reign.

Meissonnier's designs are characterized by the extensive use of bold asymmetrical compositions of scrolls, shells, sea creatures, animals, flowers, vegetables, putti, and flowing water. Regardless of materials, Meissonnier twisted and turned functional and decorative elements to create fluid and vigorous movement in three dimensions. In his designs for decorative arts, Meissonnier disguised the function of structural elements through the integration of natural motifs, including vegetables such as stalks of celery and turnips. His interior designs were complex and overwhelming with a profusion of decoration and must have been even more dazzling with the play of candlelight across their deeply modelled and carved surfaces.

During the 1730s, Meissonnier designed a wide variety of works for many international clients. The most famous and surviving examples of his skill as a designer are the two extravagant soup tureens Meissonnier designed for the Duke of Kingston in 1734–36. The tureens rest on asymmetrical bases incorporating turnips; their basic forms are curvilinear shells supported by stalks of celery, onions and a large cabbage leaf. Each lid is covered with different cast silver motifs: stalks of wheat, a teal, an artichoke, an oyster, and a crab on one, and, on the other, a partridge, turnips, a crayfish and a mushroom, all rendered in extremely naturalistic detail. Although the tureens are a disparate conglomeration of decorative elements, Meissonnier has unified them through the twisting and undulating forms and lines.

In 1733, Meissonnier completed the architecture and interiors for a house for the provincial bourgeois, Léon de Bréthous in Bayonne, France. The *Oeuvre* includes several engravings for this project: a ground-floor plan, three exterior elevations, and two interior elevations. Although the location of this house was irregular, the shapes of the rooms are symmetrical.

Meissonnier: section of drawing room

It is only in the carved mirror frames and overdoor painting frames that Meissonnier demonstrated the plasticity and fluidity of line that so characterized his most fully developed interior schemes.

In 1734–35, Meissonnier designed a *cabinet* for Count François Bielinski, the Grand Marshal of the Polish court under Augustus II in Dresden. Meissonnier's interior successfully integrated architecture, sculpture and painting. Large painted panels of allegorical subjects filled the ceiling and the walls on either side of an overmantel mirror embellished with twisted ormolu acanthus leaf candelabra. The paintings, in grisaille heightened with gold, depicted classical gods and goddesses on the theme of love, surrounded by putti, garlands, foliage, and shells, both painted and carved. The marble fireplace mantel was fully integrated with the carved relief of the dado panelling and the flimsily supported console table. Meissonnier's split with traditional French interior design included breaking the solid and continuous line of the cornice and adding a voluptuous plasticity of the carved and painted ornament. A design for a sofa for Count Bielinski, dated 1735, is also included in the *Oeuvre*.

Meissonnier's last documented project was for the ceiling paintings and decorations of a salon for Princess Sartorinski (Czartoriska) of Poland. This commission was ordered in February 1748, and designs were found in Meissonnier's studio at the time of his death, although the project was never completed. His designs displayed an increased asymmetry, especially in the decoration of the cornice, which seemed to move backwards and forwards in space, and included illusionistic paintings of courtiers looking down into the room. Stylistically comparable to this project, and probably dating from the final years of Meissonnier's career, was the commission for a *cabinet* for an unnamed Portuguese patron.

Meissonnier was not only a practising architect, but was also interested in the history of architecture. He drew two large folio sheets of 46 small illustrations of primarily Western buildings, which were printed by his publisher Gabriel Huquier as *Parallèle général des édifices considérables depuis les Egyptiens, les Grecs, jusqu'à nos derniers modernes* probably after Meissonnier's death. The first sheet included not only ancient structures but modern European ones as well, including Wren's St. Paul's Cathedral and works by Borromini. On the second sheet, Meissonnier presented his rebuilding of the center of Paris, giving new designs for a Hôtel de la Ville on the western end of the Île de la Cité. Unusual for his time, Meissonnier strove to establish stylistic links between ancient and modern architecture.

Although Meissonnier's interior schemes were not copied assiduously by subsequent Rococo artists and designers, they inspired those who followed him to experiment with asymmetrically arranged elements and organic motifs in a variety of materials such as wood, silver, ormolu, and porcelain. The sensation of movement which characterizes all of Meissonnier's designs, in metal as well as stone and wood, particularly influenced his successors in the Rococo style. His designs served to popularize the Rococo style, which held sway throughout Europe and America until the end of the 18th century.

Biography

Born in Turin in 1695, the son of a Provençal goldsmith and sculptor. Apprenticed to his father. Married Françoise Petit. Active as a goldsmith in Paris by 1718. Appointed Orfèvre du Roi to Louis XIV, 1724; became a master of the goldsmiths' guild, 1724. Also active as an architect, designer and decorator from 1724; succeeded Jean II Berain as Dessinateur de la Chambre et du Cabinet du Roi, 1726. Published several series of engravings throughout his life; a complete set was issued posthumously by Gabriel Huquier. Died in Paris, 1 August 1750.

Selected Works

Examples of Meissonnier's drawings are in the Musée des Arts Décoratifs, and the Bibliothèque Nationale, Paris. Most of his designs for interiors and furnishings, as well as metalwork and ornament, are illustrated in the *Oeuvre de Juste-Aurèle Meissonnier*. Two of the silver tureens made for the Duke of Kingston (1734–36) survive in the Cleveland Museum of Art and in the Thyssen-Bornemisza Collection, Lugano.

Memphis

Italian design firm, 1981–88

Memphis is the name given to the most influential Italian design group of the 1980s. Launched in Milan in 1981 by the designer, Ettore Sottsass, the group produced designs for fabrics, furniture, lighting, silverware, ceramics and glassware. It also did much to re-establish Italy as the centre of radical new ideas and trends, and helped by groups including Memphis, and by the growing importance of Italian fashion, Milan became the contemporary city for design.

In the post-war period Italy became synonymous with leading edge work in design, and this position of pre-eminence was confirmed by a seminal exhibition in New York called *Italy: The New Domestic Landscape*, held at the Museum of Modern Art in 1972. But almost at the same time Italian designers suffered a major setback brought about by the international oil crisis of 1973, a recession which effectively halted the spirit of radical experimentation in Italy during the 1970s. Instead of the avant-garde, Italy became known for the classic conservative work epitomised by Mario Bellini for Olivetti and Vico Magistretti for Cassina during the 1970s. Olivetti's sleek black wedge typewriters, and the beautifully crafted leather furniture for Cassina expressed the mood of the late 1970s, but not for long. The prevailing status quo was soon to be challenged by Memphis and other design groups in Milan including Studio Alchimia.

Right from the start Memphis placed itself on the international stage. The name itself is an important signal, combining as it does references to Elvis and to the ancient Egyptian capital. It was the kind of quirky irony and ambiguous cultural message the group hugely enjoyed. And Memphis itself was drawn from all over the world, including Sottsass, his friends, employees and admired guests, among them Michele De Lucchi (Italy), George Sowden (UK), Martine Bedin (France), Hans Hollein (Austria), Michael Graves (USA), Arata Isozaki (Japan), Nathalie du Pasquier (France), Marco Zanini (Italy) and Matteo Thun (Austria). In addition, the British graphic designer Terry Jones of *i-D* magazine fame, laid out the first catalogue. When the group launched their first collection with a street party to coincide with the September 1981 Milan Furniture Show it proved an overnight sensation.

The world's press provided the group with high-density coverage, and in return Memphis provided exciting inspirational shows, great images and copy that attracted media attention from London to Tokyo. Individually and collectively they picked up on the themes of Postmodernism and could already be seen in American and Japanese architecture, but they turned the spotlight onto furniture and objects. They re-examined the role of decoration. Sottsass himself began to

rework the 1950s-inspired patterns he knew and remembered from the coffee bars of his youth. He mixed patterns together and encouraged the younger designers in the group, in particular du Pasquier, to do the same. A whole series of brightly coloured furniture upholstery, rugs, wallpapers, ties, clocks and other items were marketed by the group and other companies such as Abet Laminare. Memphis also explored the possibilities of mixing materials; placing plastic laminates alongside precious wood veneers, for example. The domestic objects and furniture they showed were fresh, playful and almost wilfully child-like. They had fun; the shelves of bookcases were no longer straight, the chairs of a leg or sofa no longer identical. As well as this they breathed new life into the staid work of Italian crafts. The colours of Venetian glass, for too long associated with kitsch souvenirs, were given another perspective with the breathtaking bowls, glasses and vases of Sottsass and the ceramics of Thun. Manufacturers took note, and before long the designs of new light fittings reflected the new style. Textile designs were similarly given a whole new lease of life under the direction of designers such as Sowden. It was a breath of fresh air throughout the Italian design establishment, spearheading a revival of design based around Milan and attracting international coverage at the annual furniture shows which drew designers and customers from all over the world. Memphis helped to give design a position centre stage on the agenda of visual culture.

Memphis was always destined to be shortlived. It had no real base and it was not Sottsass's style to direct the group. The group's links together were always casual and temporary, and members left and joined different exhibitions. Its finances were rumoured to be chaotic and were underwritten by the same Italian establishment they professed to distance themselves from. That Memphis lasted seven years is a small miracle. The last exhibition was held in 1988 and by that time it had earned an important position in the history of design. But it was not without its critics. Many of the Milan establishment felt it had turned its back on serious design to pursue work that could only ultimately turn on itself. Others felt it was elitist, producing one-off expensive objects for the affluent consumer of the 1980s. Nonetheless virtually every important museum bought Memphis furniture for its permanent collections. A whole industry of books and exhibitions appeared, charting the movement and recording these objects for posterity, the most important of which was written by Barbara Radice, Sottsass's partner and the group's unofficial archivist. And its heritage can be seen on the high street of virtually every international city from smart designer shops, to the catalogues of IKEA and Habitat.

Mendini, Alessandro 1931–

Italian designer, critic, architect and theoretician

Alessandro Mendini has been involved in some of the most avant-garde Italian design movements since the early 1970s as well as being editor-in-chief and critic for Italy's most influential design journals: *Casabella*, *Modo* and *Domus*. Mendini's interior and furniture design has evolved from an anti-design statement during the 1970s into a Postmodernist idiom, primarily as a member of the design group Alchimia, from the mid-1970s until the mid-1980s.

Born and educated in Milan, Mendini graduated with a degree in architecture from the city's Polytechnic. Until 1970, he was a partner in the architectural firm of Nizzoli Associates, when he became managing editor of the design magazine *Casabella* (1970–76). In 1976, he became editor of the fashion issues of *Domus*, a position he held until 1985, and in 1977, he founded the magazine *Modo* and was its editor until 1983.

In 1973, *Casabella* announced the formation of Global Tools, of which Mendini was a founder-member. Global Tools aimed to promote radical design through discussion and experimentation among young designers. Although the project had little impact on contemporary design, it demonstrated shared idealism and solidarity within Italian radical design, as nearly all the major figures of the new Italian movements participated.

Many of Mendini's early design projects were dark and even macabre: a coffee table in the form of a glass coffin containing

a life-like image of a naked woman, and the "earth chair," a plexiglass chair filled with soil. In a 1974 issue of *Casabella*, Mendini described this last work as being "part of a group of objects whose evocative, mystic, and sadistic design leads to their use in a ritualistic or embarrassed way. The transference of the most primitive material, the earth, inside a living-room, and its freezing in a stereometrically-shaped plexiglass chair make for an unreachable material. The chair is no longer a functional instrument designed for rest, but a reliquary for something lost."

In the mid-1970s, Mendini became a proponent of the "anti-design" movement, in which the emphasis in the design of commonplace objects turned away from the Modernist view of the primacy of function, towards the purely decorative. The most important characteristic of this movement was the eclectic, playful and decorative use of materials. Mendini also became absorbed in "re-design", a belief that all functional objects had been designed and that there was nothing new. By studying the historical forms of everyday objects, designers merely gave personal interpretations of the past.

In 1976, the architect Alessandro Guerriero invited a group of young designers to exhibit their work at his studio-showroom. This group, which called itself Alchimia (also known as Alchymia or Studio Alchymia), included Mendini, Ettore Sottsass, Jr., Andrea Branzi, the UFO group, Michele De Lucchi, and several other young designers. The name Alchimia was chosen to challenge the rational methods of the Modern Movement and to evoke a more mystical approach to popular culture. Alchimia responded to impulses of the Postmodern movement: focus on everyday objects and the primary importance of decoration. The group strove to liberate everyday objects from kitsch and to elevate them to high culture, at the same time making them more accessible. Members of Alchimia addressed design issues in architecture, interiors, graphics, and fashion, formulating universal theories which could be applied to all disciplines.

In 1978, Alchimia launched its first collection of furnishings, and in 1979 it presented the *Bau Haus* collection. The interdisciplinary nature of the group allowed members to collaborate on projects. The work was characterized by the modification of everyday objects through the integration of simple forms and assertive decoration. A brightly colored graphic style, derived from motifs of the 1950s, distinguished almost all of the designs: chairs and cabinets were altered by the addition of abstract forms and boldly colored patterns. At the same time, Alchimia believed strongly in the revival of handcraftsmanship, employing traditional methods of decoration such as inlaying and carving. The group worked with new materials including plastic laminate but also with wood and precious metals; objects were sometimes unique and other times produced in limited series.

Alchimia's *Infinite Furniture*, first presented at the 1981 Milan Furniture Fair, formed an endless number of configurations, as the designers disassembled and reassembled already existing furnishings, often decorating them with movable magnetic ornament that could be placed anywhere. Mendini exhibited *Modulando* (1–4), a series of small cabinets with magnetic decoration. These furnishings were manufactured by Zabro, a collaboration of Alchimia and the Milanese furniture company Zanotta. The pieces made by Zabro were mass-

produced but then hand-decorated or silk-screened or inlaid or carved, combining both industrial design and craft. Criticism was lodged against Alchimia for its intellectualism, elitism, and pessimism; Mendini and his group resisted commercialism, and by the mid-1980s, the group became less cohesive. Sottsass had left the group in 1980 to found Memphis, a more optimistic view of the possibilities of creating a new design style.

During the 1980s, Mendini designed small household articles for the Italian manufacturers Baleri Italia and Alessi. Continuing his interest in the collaboration of artists, architects and designers, Mendini commissioned several internationally known architects to design silver tea sets for Alessi. The idea of having architects design functional objects was not new, but it led to an increased awareness of the appropriateness of architectural theories and methods applied to the design of everyday objects. In another commission for Alessi, Mendini directed Giorgio Gregori, Aldo Rossi, Robert Venturi and Sottsass in the design of Alessi's home, Casa della Felicità (1983–88), a complex of new and old buildings. This project was the first practical application of Mendini's theories of architecture: the main purpose of a building was to provide its inhabitants with shelter, both physical and mental. This protection could only be achieved by approaching the architecture as empty space, in which the inhabitants could then determine how the rooms were furnished.

During the 1990s, Mendini continued to focus on architecture. In the early 1990s, he designed a new museum for Groningen, the Netherlands, which was finally completed in October 1994. For the museum, situated on the medieval town's central canal, Mendini used a variety of forms, textures and materials in a series of connected yet individual buildings. Mendini collaborated on this project with the American artist Frank Stella, who contributed the curving, polymorphic outline of the upper level of the art gallery; the Italian architect and designer Michele De Lucchi, who designed interiors for the section devoted to local history; and the French designer Philippe Starck, who organized interiors for the ceramics gallery. Mendini saw the Groningen Museum as an example of "artistic architecture", making the connection between the building, the art and artefacts it contained and the way that they were presented.

Beginning in the early 1970s, Mendini organized a great many exhibitions of contemporary design and architecture, including: *Contemporanea* (Rome, 1974); the XVI *Triennale* (Milan, 1979), the *Venice Biennale* (1980), and the XVII *Triennale* (Milan, 1983). In 1979, Mendini won the Compasso d'Oro for his work in design and Alchimia won the same award in 1981.

Mendini, through his architecture and design work as well as his critical writings, continues to consider the questions of consumerism and the role of the mass-media in the contemporary world and to explore the relationship between architecture, design and popular culture.

Biography

Born in Milan in 1931. Studied architecture at the Politecnico, Milan. Partner, industrial design studio Nizzoli Associati, Milan, 1965–70.

Founded the radical design group Global Tools, with others, 1973. Managing editor, *Casabella*, 1970–76; founder and managing editor, *Modo*, 1977–83; managing editor, *Domus*, 1980–85. Designed and organised exhibitions for the Studio Alchimia from 1976; also for Cassina, Alessi, Zanotta, Fiat, Zabro, Driade, MIM, Poltronova, Elam, and Anet Labinati. Lecturer, Viennese Design School, 1983. Awarded Compasso d'Oro, 1979.

Middle Eastern Interior Design

Knowledge and appreciation of the qualities of Middle Eastern interiors filtered gradually and unevenly into Western Europe. The pace of enlightenment escalated from sporadic and leisurely to relatively consistent and rapid as more European professionals and travellers visited the Middle East, notably from the late 16th century onwards. Common at all stages however was a sustained curiosity about the manners and customs of Middle Eastern life.

Exchange in terms of material culture had effectively long been established between East and West through such means as geographical proximity, diplomacy and trade. A powerful Muslim presence in Spain from the mid-8th to the late 15th century resulted in a remarkable contribution to architectural planning and design and textile production which in turn influenced and enriched the repertoire of European decoration. Objects also reached European courts and churches as formal

Middle Eastern: wood panel with intricate geometric design of inlaid wood and ivory, Cairo, 14th century

diplomatic gifts, such as silk carpets from Isfahan (capital of Iran from 1598 to 1722) and a pair of Turkish velvet cushions presented respectively to the Doges of Venice in 1603 and 1622, and to Frederic I of Sweden by Abdi Pasha of Algiers in 1731. And a flourishing trade provided a steady flow of goods from the Middle East as luxurious furnishings for European homes. Notable examples here are the Turkish carpets illustrated in Italian and Flemish paintings from the late 15th century, listed in great numbers in the inventory of Henry VIII's palaces at his death in 1547, and consistently imported into the

wealthy households of Transylvania during the 16th and 17th centuries.

Objects of European origin were in turn transmitted to the Middle East. Venetian craftsmen of Murano were making enamelled glass mosque lamps in the 15th century, adapting their traditional skills to produce designs suitable for export. More spectacular European objects were introduced into the Middle East through diplomatic gifts such as the clockwork organ presented to the Ottoman Sultan Mehmet III in 1599 on behalf of the English Levant Company. The organ maker Thomas Dallam travelled to Istanbul to organise its presentation and installation. The collections of European clocks and watches preserved in the Topkapı Palace Museum today bear witness to the continued Ottoman taste for the novelties of European mechanics.

This interaction on the domestic level between East and West, however, could only offer an incomplete picture of the interior world in which the mutually admired exports were placed. Each culture adapted them to its own conventions of household decoration and furnishing. The handsome knotted wool carpets, for example, whose rich designs harmonised so well with the heavy wood furniture of 16th and 17th century European households, were initially draped over tables, and then spread on the floors, where they were subjected to the wear and tear of shod feet. In their countries of origin such as Turkey and Iran, they were also used as floor coverings but they were treated as a means of defining a comfortable living space. People replaced their outdoor boots and shoes with house slippers and reclined, read, entertained, ate and slept at ground level in flexible interiors which traditionally did not use customised suites of furniture such as dining tables and chairs, elaborate beds and wardrobes, to identify and limit a room's function.

Initially there was little opportunity for Europeans to see and understand a Middle Eastern interior. Contact was limited to formal occasions and business activities. Access was not readily granted to the family quarters of a household. Such conditions inevitably shaped European attitudes and a considerable degree of patience, powers of observation, and a genuine interest in Middle Eastern life were required to overcome them. Increasingly from the late 16th century onwards as it became easier to travel and work in the Middle East, there were European residents and visitors who have left descriptions in their reports, letters, diaries and sketches of their experiences. These accounts interpreted together with the primary evidence of surviving domestic architecture make it possible to reconstruct the plan, decoration and furnishings with regional and seasonal variations of household interiors. Again, however, the view is limited as it applies to the palaces and wealthy residential quarters of a city. The homes of the poor were shabby flimsy structures which did not survive either natural disasters such as the fires which regularly devastated Istanbul or the ambitious town planning schemes of successive rulers.

Allowing for these qualifying factors there were Europeans who have left outstandingly detailed and meticulous records of the experiences in the Middle East. The few selected here – Sir John Chardin, Lady Mary Wortley Montagu, Edward Lane and John Frederick Lewis – though differing in profession, social status and the times and circumstances of their travels,

all reveal a common aim to observe and document the cultures around them without prejudice. They were all fortunate as they spent long periods of time in the country of their choice and were able to penetrate beyond the formalities of polite acquaintance.

Sir John Chardin (1643–1713), a French Huguenot jeweller, stayed in Iran from 1666 to 1667 and later from 1673 to 1676. Based in the capital Isfahan he combined his profession which took him to the highest court circles with a thorough study of the language and culture. His *Travels*, published in French and English, reveal a remarkable knowledge of both the political scene and social environment: they describe the households, appearance, dress, food, crafts and trades of 17th-century Isfahan. A comparable achievement is seen in the letters of Lady Mary Wortley Montagu (1689–1762) who accompanied her husband Edward Montagu to Istanbul during his appointment as English ambassador to the Ottoman Turkish court from 1717 to 1718. She studied Turkish and took the opportunities which her position offered of invitations to the homes of wealthy Turkish women which she described with enthusiasm and careful detail. She supported her descriptions of domestic life with much intelligent comment on the role of women in Turkish society, practical observations on architecture and town planning and some account of contemporary religious and social patterns.

Edward Lane (1801–76) took a different approach to Egypt as he steeped himself in Cairene life. He stayed in the old city, adopting local dress and customs and intentionally mixing with Muslim Egyptians. The results of his years of scholarly research between 1825 and 1849 are seen in his *Manners and Customs of the Modern Egyptians* which includes among a great range of subjects a study of the setting and pattern of domestic life. The watercolour sketches and oil paintings of John Frederick Lewis (1805–76) both illustrate and complement the writings of Edward Lane. Like him, Lewis immersed himself in the Egyptian way of life during his long stay in Cairo from 1841 to 1851. His work displays a great knowledge of the form and texture of Cairo's streets and markets, the courtyards and rooms of traditional houses, furnishings and dress.

These four sources are a sample of the rich material which reveals the interiors of the wealthy urban homes of Turkey, Iran and Egypt between the 16th and 19th centuries. They present a world in which family life took place in a domestic environment of considerable material comfort in which textiles of rich colour and design played a major role in furnishing. Certain general principles of planning and design were common to all regions. Private family life was screened from public view behind high walls. The streets of a residential quarter therefore presented a discreet, at times anonymous appearance as deceptively modest entrances concealed the richness of the interior and locked gates discouraged unwanted attention. There were clearly prescribed social and cultural reasons for this, based on the segregation of men and women. This had evolved through a combination of long-established Middle Eastern custom and Islamic recommendations for modest behaviour. Domestic life at all levels required the strict division of a household into the men's quarters where visitors were received, and the women's quarters where only members of the family, the women and their female friends spent their time. This emphasis on privacy and seclusion can be traced

Middle Eastern: linen hanging embroidered with design of stylised carnations, Turkey, 17th century

throughout a house. Externally the town houses of Turkey and Egypt presented a picturesque façade to the outside world. As space was precious it was difficult to afford the luxury of secluding a house within a walled garden. Where houses directly overlooked the street, they were built to a height of two or three storeys. The ground floor storey had blank walls as this area was reserved for storage. The upper storeys had deep windows screened with carved wooden lattices which resembled closed balconies. Each projected well over the one below, supported on curved supporting arches. This feature maximised space, ensured privacy, regulated the flow of light and heat and protected the entrance and lower walls from sun and rain. Houses in Iran preferred to exhibit only a high blank wall to the street.

In both Turkey and Egypt the external façades often masked a complex labyrinth of up to 30 or 40 rooms to accommodate the needs of the extended family. Behind the entrance, space was divided between the men's and women's quarters. In Turkey these took the form of two open courts linked by a narrow corridor. Covered variations of this plan located the men's quarters on the first floor above service quarters and the women's quarters secluded on the top floor. Within each courtyard arrangement and function of space was similar. Around the men's quarters at ground level were stables and storerooms for household supplies and rooms for menservants. On the next floor was the main public reception area where visitors were received and business conducted. The courtyard of the

Middle Eastern: interior of the house of Shaykh Sadat, Cairo, by Frank Dillon, c.1875

women's quarters was more intimate as it was private. Storerooms at ground level enclosed a garden. Stairs led up to the reception room which was where female guests and close family relations were entertained. In both men's and women's quarters rooms surrounding the reception room were flexible and could function as additional sitting or sleeping areas. Kitchen and bath areas were in separate buildings.

The interiors of houses in Egypt were planned on similar principles with variations linked to climatic conditions. In the courtyard of the men's quarters, for example, there could be an open kiosk which was used as a summer reception area. The stairs to the rooms of the women's quarters also led to terraces, balconies and summer sitting rooms open on one side for the sake of coolness. In Iran internal space, while observing the segregation of men's and women's quarters, was organised differently. In the grandest households they were independent units such as octagonal pavilions, rectangular buildings enclosing in turn open courtyards, deep columned porches grouped in an informal modular plan within landscaped gardens. These units were flexible and varied in function. The deep porch, for example, could be an entrance, an audience chamber, a sleeping area in hot weather, or a balcony if raised on a second or third storey. In smaller households equally flexible and practical effects were achieved. Within the retaining wall, courtyards of both men's and women's quarters could be linked by a discreet connecting passage or could be separate enclosures within a large garden. The resulting plan was versatile, functioning equally well in winter and summer. Rooms with deep porches opened directly onto a garden court. They were fitted with sash windows which could be closed in winter. Behind each porch were suites of sleeping and storage rooms. Stairs also led to basement sitting rooms and roof terraces used as living and sleeping areas in the heat of summer.

Within these interestingly planned houses interiors were as comfortably and handsomely equipped and furnished as the family's means permitted. It is important to note that once the conventions of gender segregation had been observed, the house was remarkably flexible. Apart from specific quarters such as stables, storerooms, kitchens and baths, there was no real functional division between rooms. By European standards they were remarkably empty, as furnishing consisted of cushions, covers and quilts. Even the main reception room of both the men's and women's quarters, although on a large scale and richly decorated, could equally well be used as a dining and sleeping area. If there were large numbers of guests, terraces, roofs and even porches, were regarded as convenient areas for accommodating them. This versatile concept of domestic space supports the priority given to the family and hospitality to guests in Middle Eastern culture. A flexibly organised home can offer accommodation and food to all members, relations and friends of an extended family.

The decoration and furnishing of these Middle Eastern interiors had to both create an inviting and attractive environment and to ensure that the necessary flexibility of function could be maintained. This was achieved through rich and harmonious decoration of room surfaces and the use of textiles as the main element of furnishing. Their close relationship is seen in the influence of textile design on architectural ornament. Repeated small checked and striped motifs in brickwork, for example, resemble weaving patterns. Panels of brilliantly coloured tile-

work, friezes of interlaced foliage and geometric motifs in carved and painted plaster and wood inlaid with mother-of-pearl and ivory are effectively immobile textiles. Both the decoration of ceilings, walls and floors and the quality of the display of textiles convey important messages about wealth, status, personal taste and culture.

The men's and women's quarters of a great household were lavishly decorated, especially the reception rooms which provided visible evidence of a family's prestige and influence. These rooms were the largest and highest of each quarter and were flanked by small rooms. In Turkey and Egypt certain conventions were followed. At one and sometimes two ends of the room an area was raised above ground level to function as a seating area for the host and family and specially honoured guests. Wood, tilework and glass were the main materials used to decorate the reception rooms of wealthy Turkish households. Ceilings were of wood treated in various ways. One of the most attractive treatments involved expert joinery skills as cut and polished wood was shaped and interlocked into a complex mosaic of star and diamond motifs often grouped around a central boss carved into a rosette. By the 19th century such ceilings were further embellished with painted detail in red and green which could then be further enhanced with gilding.

Walls offered more opportunities for colourful decoration. The brilliant polychrome tilework of the factories of Iznik decorated with abundant designs of curved foliage intertwined with lotus and peony was in the main reserved for the palaces of the Ottoman imperial family. In general the walls of wealthy private citizens were decorated with wood and paint. A reception room would be lined with panels of wood inlaid and carved with geometrical motifs alternating with cupboard doors and niches. Walls could be painted with graceful flower and foliage designs in clear fresh colours. This treatment of wall space was both practical and decorative. As interiors lacked freestanding furniture, cupboards and niches were used for the display and storage of clothes, soft furnishings and ornaments. As the interior of the household had to be screened from the outside world, lower windows were covered with wooden shutters and strong lattices, which regulated circulation of light and air. The upper level of windows had fanlights filled with an intricate lacework of finely carved plaster worked into foliage, flowers and medallions, all filled with glass of emerald, deep blue, turquoise and amber yellow. By the late 18th to early 19th centuries, however, this heavy style of window decoration, especially in the summer houses of the Bosphorus, was increasingly replaced by plain glass screened by fabric and lace blinds and curtains. Floors were constructed of wood, and as the climate of Istanbul and towns such as Bursa and Iznik is damp and chilly during the late autumn and winter months, were covered with carpets.

Homes of the wealthy in Egypt were decorated in a similar manner adapted, however, to suit local taste and climate. Ceilings were made of transverse wood beams which were usually painted and gilded. In the main reception rooms they were more elaborate, with designs of intersecting stars, lozenges and hexagons painted in green, red and blue and sometimes a high central cupola inset with coloured glass to provide filtered overhead lighting. Walls were generally plastered, whitewashed and painted with repeated foliage and

Middle Eastern: wool hanging embroidered with birds among foliage, Kirman, Iran, 19th century

floral motifs. Reception rooms of the rich which were used in the hot summer months often had walls paved with marble. As in traditional Turkish homes, wall surfaces were divided by the intricately carved and inlaid wooden doors of cupboards and niches which stored and displayed clothing, furnishing textiles and ornaments. The windows of the closed projecting balconies, lined with carved wood panels and screened with intricate pierced lattices functioned as small intimate alcoves. Low stone or wood benches lined the walls of the seating areas at each end of a reception room. Windows in the upper rooms of a multi-storeyed house were filled with brightly coloured glass and plaster mosaic in designs of geometrical motifs or bouquets of flowers. Floors were not covered with carpets as in Turkey but paved with a mosaic of white and black marble and glazed red tile in elaborate patterns of interlocked squares and stars. A small marble fountain in the centre of the room from which water trickled into a shallow pool further enhanced the coolness of the interior.

The interiors of the great houses of Iran made adventurous and colourful use of various techniques to decorate a room from ceiling to floor with lavish ornament. This was prevented from being overwhelming by the open and spacious proportions of the buildings. By the 19th century a distinctive style of

interior decoration had developed which matched the techniques of polychrome tilework, carved, moulded and painted plaster, coloured glass and mirror mosaic and painting on wood and canvas to the unit of a room's structure which would show it to best advantage. The dominant medium of decoration was polychrome ceramic tilework which invaded every surface of a building, draping both exterior and interior with friezes, hangings and borders. The main centres of production were Tehran, Isfahan and Shiraz which were kept fully occupied catering to this fashion for tilework decoration. In affluent households tile pediments were set over doors, windows and wall niches. European influence in the late 19th century introduced ornate fireplaces whose mantelpieces and borders provided yet more surfaces for tiles. Both overglaze and underglaze polychrome techniques were exploited in a lively and varied repertoire of subject. There were traditional themes of flowering scrolls and medallions, pictorial scenes from favourite classical and romantic works of literature, landscape views, and novelties such as groups of women in European dress and interpretations in hatched and stippled monochrome black of contemporary photographs.

Other decorative techniques were equally inventive. Glass was made into a mosaic of red, blue, green and yellow set within a wood frame and used for fanlights and sliding sash windows. A unique treatment of glass involved the use of a honeycomb mosaic of mirrorwork to create an intense silver light on ceilings and vaults of both rooms and porches. Carved, moulded and painted plasterwork, which has a long history in Iran as a form of architectural decoration, had developed by the 19th century into an elaborate means of ornamenting ceilings, walls and fireplaces with designs of bouquets of flowers and bowls of fruit in prominent relief. Startling interior decoration was created with panels painted either directly onto plaster-coated walls or in oils onto canvas. Here traditional schemes of flowers and birds mingled with large figurative subjects and handsome young men and girls, placed in niches around a room. A similar scheme of decoration was also found on ceilings.

Despite the lavish surface treatment of the rooms of Middle Eastern interiors, the absence of furniture gave an impression of emptiness. This was counteracted by the use of textiles, as many and fine as a family's financial and social position could afford, as the principal means of furnishing. The use of curtains, hangings, covers, cushions and carpets could transform a room for changes of season and climate and for special occasions. The main cities of the Middle East had thriving textile industries which catered for both domestic and export markets. Istanbul had workshops which produced luxurious fabrics and markets which stocked the opulent silks of Bursa, Damascus and Aleppo. Cairo had a flourishing market in linen and cotton, while Isfahan specialized in the manufacture of silks and block-printed cottons. Both Turkey and Iran produced woven and knotted pile carpets in wool and silk.

In Turkey textile furnishings were much valued. Velvet and heavy brocaded silks provided warmth and decoration in wealthy Ottoman households. Traditional colour schemes based on deep crimson and green were enhanced by designs woven and embroidered in gold and silver thread with bold stylized motifs of carnation, tulips and pine cones. Textiles were hung as curtains or decorative panels on walls and doors,

used as screens to enclose areas in a large reception room, and made into cushions which could be combined and heaped in many formations for seating and reclining. A wide range of carpets with pile knotted in wool and silk covered the floors of reception and adjoining rooms. These were the products of Turkey's own centres such as Usak and Gordes, and the much prized imports from Iran. There was a wide choice of design from angular flower motifs, schemes quartered to resemble the layout of a formal garden, or spirals and scrolls of flowering stems entwined around medallions.

Draped and carpeted rooms were versatile. They could easily be adapted for use as bedrooms. Bedding consisted of mattresses, padded quilts, pillows and sheets which were stored in the panelled and painted cupboards which lined the walls of a room: these were pulled out as needed and made up into flat beds on the floor carpet, often supported by cushions. Covers, napkins, towels and clothing were also stored in the wall cupboards. Covers were particularly flexible. Rich covers of embroidered and quilted silks and velvets were placed on seating areas for senior family members and important guests. Covers draped the mattresses and quilts of bedding and were also wrapped around bundles of clothing. If the textiles could be folded into small neat parcels they were wrapped in embroidered covers and stacked on open display in the niches and shelves of a room. Mobile furniture was used sparingly to supplement the textiles and to provide decoration. Wall niches and shelves held vases of flowers. There were folding stands made of wood, often lavishly decorated with ivory and mother-of-pearl inlay, which were opened out to hold books and manuscripts. Low stools were covered with metal trays to serve as tables at mealtimes. Chests and caskets were also used for the storage of textiles, clothing and jewellery.

Wealthy households in Egypt were also furnished with textiles adapted, however, to local conditions. The use of carved wooden lattice screens across the wide and deep windows of Cairo houses left no space for velvet and brocaded silk hangings and curtains, which in any case would have been too thick and heavy for the climate. The elaborate marble and stone mosaic inlay of floors provided pattern and colour. Small carpets were occasionally used during the winter months and to function as informal seating. Textiles were mainly used both for the cushions which decorated the low benches lining the walls of reception rooms and for the bedding which, as in Turkey, was stored in cupboards until required. The use of mobile furniture was as sparing as in Turkey. In both countries changes occurred in these schemes during the 19th century as a result of contact with Europe. These are seen in the introduction of furniture such as chairs, tables, couches, bureaux, and ornate lighting and lamp fittings which served to define the functions of rooms at the expense of the flexibility of the traditional interior.

In Iran interesting solutions were found to the problem of adapting a room to specific functions. Where apartments were clustered around a square or rectangular courtyard, sash windows with wooden frames extending from ceiling to floor could be raised or lowered at will to divide or extend a living space, to open or close areas according to seasonal weather conditions. The absence of both fitted and movable furniture was remarkable. There was no equivalent of the raised Turkish and Egyptian seating around the walls. There were no small

stands for books or to hold trays of food. Recessed niches in the walls provided a surface for books and ornaments such as ceramic or glass vases of flowers. There were sometimes chests for the storage of household textiles and clothing, although these could be neatly stacked at the back of a room and covered with a fine cloth. Thin mattresses and padded quilts arranged on the floor provided bedding. Meals were served on a cloth spread out on the floor. The simplicity of this floor-level life meant that a room could be easily transformed into sleeping, eating and reception areas.

The most important textiles in Iranian domestic interiors were floor coverings, mainly a family's collection of carpets with a knotted pile woven in wool and silk. Variations in the depth and thickness of the pile meant that carpets could be used as comfortable and warm floor coverings or as covers for pillows and cushions. Different types of carpet had specific function, and not all of a family's collection was on display at any one time. They were carefully grouped and placed over a protective felt underlay which was a decorative textile in its own right, ornamented with rippled motifs of blue and white or red and green. There were carpet designs to suit all tastes, woven in the city workshops of Kashan, Isfahan and Kerman. In general, however, the preferred choice was for exuberant floral patterns to harmonize with the lavish interior decoration. They included palmettes, bouquets of flowers entwined within foliage and ribbon swirls and scrolls, alternating stripes of flowers and leafy stems, formal arrangements of medallions, as well as directional designs such as trees laden with flowers and fruit. Colours matched the richness of the designs, with motifs in deep brick and crimson reds, golden orange and yellow, light and dark blues and green displayed against a background of beige or creamy white. A taste also developed for large scale pictorial designs woven with great technical skill and extremely fine knotting. Subjects here included scenes of court entertainment with musicians and dancers and popular episodes from the classics of Iranian epic poetry.

Many textile fabrics and techniques were resourcefully exploited to provide drapery to supplement floor coverings. Silks in white and yellow were quilted and embroidered in fine silk threads of crimson, pink, blue and green, using a neat chain stitch to outline and fill designs of medallions against a field of flower motifs, all contained within a border of deeply curved floral scroll. These quilts were used as bedcovers or as floor-level seating. A more sumptuous treatment of embroidery is seen in covers of crimson silk velvet worked in coloured silks and silver thread, with designs of flowers and birds enfolding panels of inscriptions. Although textiles were mainly used as covers, they also functioned as hangings and curtains which provided splendid displays of skill and design.

Certain towns in Iran were famous for their specialized textiles. Kerman was renowned during the 18th and 19th centuries for its flourishing textile industry which catered for furnishing and clothing needs with a wide range of woven fabrics and knotted pile carpets. A distinctive embroidered textile was also produced, usually of fine red wool with lively designs of foliate stems and medallions, birds and cypress trees worked in neat outline and filling stitches to simulate the texture of weaving. The Caspian town of Resht specialized in the intricate and time-consuming technique of embroidered patchwork. A mosaic of closely -woven wool pieces in strong

Middle Eastern: painted papier-mâché book cover, showing ladies at a party, Iran, 19th century

reds, greens, yellows and black was stitched together and embellished with appliqué and embroidered detail in contrasting colours. Subjects ranged from symmetrical arrangements of foliage to ambitious pictorial compositions with figures. Block-printed cotton was a versatile fabric used for curtains, hangings, bedcovers and also clothing. This fabric, a speciality of Isfahan, was printed with carved wooden blocks to produce an outline in black which was then filled in with red, blue and yellow. The design repertoire was both versatile and imaginative. Large pictorial compositions based on trees with tigers and peacocks, figurative scenes and hunting expeditions were used for hangings and curtains; while small repetitive floral designs were preferred for clothing. Eventually, as in Turkey and Egypt, European-style furniture entered the wealthy households of Iran during the 19th century to define the functions of rooms.

While many historic buildings and their interiors, as in Europe, have been much altered or demolished, there are a number of surviving examples that it is still possible to visit today. In Turkey these include: the Topkapı Palace (15th–18th century), the Dolmabahçe Palace (completed 1853), and the Beylerbeyi Palace (1856–57) in Istanbul; the Citadel quarter with several 19th-century houses now restored and converted into restaurants in Ankara; a number of 18th- and 19th-century houses restored around the port of Antalya; a fine 18th-century house in the Muradiye quarter in Bursa, and outside the town the village of Cumalikizik which contains houses dating from the late 19th and early 20th centuries; and excellent examples of 18th-century provincial Ottoman houses in the town of Safranbolu. Egyptian architecture and interiors

are well represented in Cairo, particularly in the Manyal Palace (1903), and in the Gayer-Anderson House, a traditional 19th-century house near the mosque of Ibn Tulun. And Iranian examples include the Gulestan Palace (18th–19th century) in Tehran, and the 19th-century Nerangistan house in Shiraz.

Mies van der Rohe, Ludwig 1886-1969

German architect and designer

One of the greatest architects of the 20th century, German-born Ludwig Mies van der Rohe made a significant impact on building art and the design of furniture and interiors throughout the world. His design philosophy was characterized by reducing architectural structure and space to geometric abstraction with meticulously proportioned building parts and materials. Free from archaic embellishment, his architecture was conceived as pure object, highly functional and independent of context.

Director of the Bauhaus (1930-33) and Director of Architecture at the Illinois Technical Institute (1938-58), throughout his career Mies was committed to formal elegance, precise detail, and the use of noble materials. His finest European works include the German Pavilion at the Barcelona International Exposition of 1929 and the Tugendhat House in Brno, Czechoslovakia, completed in 1930. His American masterpieces, built after he left Nazi Germany in 1937 for the United States, include the Farnsworth House, Plano, Illinois (1951); the Crown Hall (1956), and the bronze and glass Seagram Building in New York (1958).

Mies conceived the spatial experience as continuous and open ended, with the interior and exterior to be integrated both visually and physically. The structuring of architectural space was achieved by the placement of lines (columns), planes (walls), and three-dimensional objects (furniture, furnishings); he pondered their mutual relationship and their relationship to context. In such a space there was no place for heavy load-bearing walls with punched openings, nor for over-stuffed rooms filled with massive, dusty furniture and thick draperies. In the Farnsworth House, the world outside became a part of the interior. A steel-framed open-plan glass box, its utilities, including plumbing and cooking, were focused in a central opaque box. While the internal partitions enclosing this box were natural brick, the glass exterior walls afforded a view of the surrounding trees with their ever-changing colors.

The modern concept of health and hygiene was for Mies no mere rationalization, but a firmly held belief that the sun's rays entering buildings through large picture windows would guarantee healthier living conditions. The flat roofs decreed by modern architecture were to serve as sun decks and exercise facilities. The bourgeois interiors of Mies's youth, the richly machine-carved legs of the pseudo-Renaissance chairs and tables, tasselled plush velvet upholstery and curtains, were remnants of the past. Furthermore, these stuffy interiors and ornaments equalled bourgeois hypocrisy, while beauty, if still acceptable at all, was only valid according to Mies as the "splendor of truth". In 1925 *Stavba*, the Czechoslovak architectural magazine, declared that modern interiors should embrace the following: hygiene, material strength, low cost, efficiency, and lightness.

The Weissenhofsiedlung international exhibition in Stuttgart, organized by the German Werkbund in 1927, was designed by Mies, at the time a vice-president of the society. He invited several European architects to submit designs for the housing project. The exhibition was highly innovative and influential. Interiors, too, were revolutionary: a new era of interior architecture had been founded in 1925 with the development in the Bauhaus school of Marcel Breuer's first tubular steel furniture. For the model rooms of his apartment house at the Weissenhof, Mies designed a cantilevered tubular steel side chair, an improvement on the Dutch architect Mart Stam's gas pipe cantilevered chair of 1926, which was also in the exhibition. The steel bars of Mies's chair bent at the front into a coil that exploited the resilience of the spring principle.

Without doubt, Mies's best known item of furniture was the *Barcelona* chair, designed in 1929. Here he used chrome-plated flat steel bars, welded together in an X-shape side elevation, with leather straps screwed into edges of transverse bars holding solid horsehair cushions, with plain fabric or pigskin

Mies van der Rohe: dining room, Tugendhat House, Brno, Czechoslovakia, 1930

covers. Designed at the same time, the *Barcelona* ottoman was a companion to the chair. Initially the manufacturers were the Berlin Metallgewerbe Joseph Müller; in 1948 Knoll International took over production.

Mies placed the *Barcelona* chair and the ottoman, finished in an emerald green cowhide, within the Great Room of the Tugendhat House. His aim was to demonstrate the new domestic architecture in every aspect of the house, and to provide comfort by installing conventional club chairs would have been inappropriate. After numerous studies, Mies arrived at the *Tugendhat* chair (1930), applying the cantilever principle of the tubular steel chairs to a flat bar frame for resilience. The continuous seat and back frame is screwed at two points at side front to a support frame that descends in a sharp S-curve to the floor. The flexibility and springing of the flat steel bar is effectively exploited to allow for the gentle bouncing motion of the chair. The location of the arms, parallel to the seat frame, makes it easy to get out of the chair and improves its appearance by relieving the top-heaviness of the relatively high back. Two curved stiffening bars under the seat keep it rigid. The silver gray pigskin cushions are placed on laterally spanning leather straps. The *Tugendhat* chair was originally manufactured by the Berlin Metallgewerbe Joseph Müller and, since 1964, by Knoll International. Mies's *Brno* chair (1930), by the same manufacturers, was made from chrome-plated tubular steel with a white parchment-covered seat and back. The *Chaise Longue*, made from cantilevered continuous loop

chrome-plated tubular steel, had rubber straps and ruby red velvet cushion.

In the Barcelona Pavilion and the Tugendhat House, Mies achieved total integration of the interiors with the architectural concept. By coincidence, the plans for both were on his drawing boards at the same time, and the layouts had design strategies in common. The spatial flow – ascending the wide exterior stair from the garden, then making a 180-degree turn to the right and walking by the cruciform chrome-plated columns to enter the main room – is the same for both the Barcelona Pavilion and the Tugendhat House. The experience of endless space is defined by floor-to-ceiling glass and the white horizontal planes of floor and ceiling, with the free-standing onyx partition and groups of furniture defining the areas of activity. Materials used in the Barcelona Pavilion were reflective, and included green tinian marble, Roman travertine, with grey and bottle green glass partitions. Curtains, fabric covers, carpets and the colors of the upholstery were by chosen by Mies in collaboration with Lilly Reich. In her valuable 1969 talk, given on the occasion of the Mies exhibition in Brno, Grete Tugendhat described the color palette of the house and the design process.

In his reliance on subtle proportions, in his unique use of space, and in his emphasis on fine materials, Mies van der Rohe set the standards of the Purist form of Modernism.

Biography

Ludwig Mies. Born in Aachen, 27 March 1886, the son of a stonemason. Emigrated to the United States, 1938; naturalised, 1944. Educated at the Domschule, Aachen, 1897–1900, and at the Aachen Trade School, 1900–02; studied at the Staatliche Kunstschule des Kunstgewerbe Museums, Berlin, 1906–07. Worked as a stonemason in his family's business, Aachen, 1900–02; apprenticed to local architects and employed as a draughtsman in a stucco decorating school, 1902–04. Apprenticed to the architect and furniture designer Bruno Paul, Berlin, 1905–07. Active as an independent architect, Berlin, 1907–08. Employed in the office of Peter Behrens, Berlin, 1908–11. Worked on the Kroeller-Mueller House, The Hague, 1912. Established his own architectural practice, Berlin, 1913. Married Ida Bruhn, 1914 (separated 1925; died 1951): 3 daughters. Served in the German army, 1914–18. In private practice, Berlin, 1919–38, and Chicago, 1938–69. Designed furniture from c.1910; collaborated with Lilly Reich (1885–1947) from 1927. Director of architecture exhibitions for the Novembergruppe, Berlin, 1921–25. Co-founder, Der Ring, 1925; vice-president, Deutscher Werkbund, 1926–32; Director of the Bauhaus, Dessau and Berlin, 1930–33; Director, Armour Institute (later Illinois Institute of Technology), Chicago, 1938–58. Exhibited at many national and international exhibitions including 1927 Werkbund exhibition, Stuttgart, and the 1929 Barcelona International Exhibition. Numerous awards including Gold Medal, Royal Institute of British Architects, 1959, Gold Medal, American Institute of Architects, 1960, and Gold Medal, Institute of German Architects BDA, 1966. Died in Chicago, 17 August 1969.

Selected Works

The Mies van der Rohe Archive, containing more than 20,000 items including 2700 original drawings and blueprints, models, and work-related correspondence, is part of the Museum of Modern Art, New York. The most important part of this collection are the drawings dating from Mies's European career. Examples of his furniture are also in the Museum of Modern Art and numerous other modern European and American collections. For a complete list of his architectural projects see Drexler 1986–92.

Interiors

- 1911 Villa Perls, Zehlendorf, Berlin (building, interiors and furniture)
- 1913 Villa Werner, Zehlendorf, Berlin (building, interiors and furniture)
- 1925–26 Wolf House, Guben (building, interiors and furniture)
- 1927 Werkbund Exhibition, Stuttgart (Apartment House, interiors and furniture)
- 1927 Weissenhofsiedlung, Stuttgart (building, interiors and furniture)
- 1927 Exposition de la Mode, Berlin (Silk exhibit, interiors and furniture; with Lilly Reich)
- 1927–30 Esters House, Krefeld (building, interiors and furniture)
- 1927–30 Lange House, Krefeld (building, interiors and furniture)
- 1928–30 Tugendhat House, Brno, Czechoslovakia (building, interiors and furniture)
- 1929 International Exhibition, Barcelona (German Pavilion and AEG Pavilion)
- 1931 Berlin Building Exposition, Berlin (Model House, interiors and furniture; with Lilly Reich)
- 1935 Hubbe House, Magdeburg (building and interiors)
- 1939–40 Resor House, Jackson Hole, Wyoming (building and interiors)
- 1945–51 Farnsworth House, Plano, Illinois (building and interiors)

Additional high rise buildings and institutional projects until 1969.

Mies's furniture was all completed by 1930 with the exception of a sofa designed for Knoll in the 1960s. His work included the MR

cantilever chairs, *Brno* chair, the *Tugendhat* chair, the *Barcelona* chair and stool, and several S chairs, lounge chairs, side chairs, side tables, glass tables, coffee tables, and beds. Much of his work was produced in collaboration with Lilly Reich. Mies's furniture was produced by Bamberg Metallwerkstätten, and after 1929 by Thonet; from 1948 his designs were licensed to Knoll and all his furniture is still in production.

Mirrors and Looking-Glasses

The use of mirrors as both decorative and more functional objects dates from ancient times. The earliest examples used the reflective surfaces of highly polished metals such as bronze, and small hand-held mirrors survive from ancient China, Persia and Greece. The Greeks also developed standing and folding mirror forms, with slightly convex surfaces, although still small in scale. During the Roman period hand-held mirrors, in particular, became fashionable accessories for wealthier patrician ladies, and a mural from Pompeii, now in the Naples Museum, shows Cupid holding this type of mirror for a woman combing her hair. Many of these mirrors were made from tin mined at Brindisi in Italy but others were made of glass. The manufacture of glass had originated in the Middle East, but under the Romans it spread to all parts of the Empire, with the main areas of production based around areas rich in raw materials, namely parts of Germany, France, Belgium and England in the north, and Italy in the South.

Little progress was made in the manufacture of mirrors during the Middle Ages. The majority were still small and were made from precious or semi-precious metals such as gold, silver or, more commonly, steel. The less wealthy made do with copper and tin mirrors. Hand mirrors were often set into ivory frames, their backs decorated with reliefs depicting chivalrous subjects, while toilet, or standing mirrors followed ancient precedents; an early example of a standing mirror is illustrated in the *Lady with the Unicorn* tapestry in the Cluny Museum, Paris. From the 13th century mirrors were also made of rock crystal and, very occasionally, of *verre cristallin* or glass simulating crystal. These were very costly and were often presented as official gifts to kings. From the 15th century convex mirrors, whose curved shape was determined by the way the bubble of glass was blown, were popular in Northern Europe and examples appear in contemporary paintings such as Van Eyck's *Arnolfini Portrait* (1434).

A huge advance in manufacturing occurred c.1500 when Venetian glassmakers discovered the technique of making mirrors from flat plates of glass. Based on the island of Murano, these craftsmen developed the Lorraine or "broad" process whereby molten glass was first blown into a hollow sausage shape, the ends were then snipped off and the cylinder was slit along its length and unfurled flat. Backed with tin foil overlaid with mercury, Venetian mirrors eventually drove the older metal mirrors out of fashion and dominated the market up until the end of the 17th century. These techniques were initially a jealously-guarded secret but, with the emigration of Venetian craftsmen to found glass houses in other countries, they eventually spread throughout Europe.

By the second half of the 17th century, French architects, in particular, had become fascinated by the idea of facing walls with large areas of mirror glass, and strenuous efforts were made to increase the size of the plates. In 1687 Bernard Perrot perfected the casting process whereby molten glass was smoothed over a flat metal surface which was surrounded on all sides by a shallow lip or frame. This facilitated the production of mirrors in much larger sizes, and the Manufacture Royale des Glaces was established in 1688 by Louis XIV's chief minister, Jean-Baptiste Colbert, to exploit this new technique. Nevertheless, the process was fraught with difficulties in its early years and it was not until 1691 that the first unblemished mirrors of this sort could be presented to the king, and only eleven mirrors of a substantial size (269 x 163 cm.) were produced between 1688 and 1699. The earliest mirrored interiors, such as the Louis XIV's Cabinet des Miroirs in his private apartment at Versailles (1664), the oval room at the Château de Maisons (c.1650) and the most celebrated of all, the Galerie des Glaces at Versailles (c.1682), continued, therefore, to use Venetian techniques of abutting small plates of mirror-glass to form larger panels. The Galerie des Glaces has 17 large panels, each consisting of 21 smaller plates. By the 1700s, however, the availability of larger sheets had begun to transform the appearance of fashionable Parisian rooms. Large mirrors stretching up towards the ceiling were set into the chimney breast and from the 1720s mirrors could be set into panelling that reached the full height of the room from the dado to the cornice. Combined with the newly fashionable gilt *boiseries* and enhanced by the sparkling reflection of candlelight, the effect of these interiors was deemed both striking and extremely luxurious, and small, richly decorated closets or cabinets were frequently entirely encased in mirrored glass.

Influenced by French fashions and the example of Versailles, mirror rooms, known as Spiegelkabinetts, also became popular in Germany in the early and mid-18th century. One of the first examples was in La Favorite (1707), a small schloss built for Margravine Francesca Sibylla Augusta, near Baden-Baden at Rastatt. This room includes a vast quantity of ornament and contains over 300 mirrors, held in place by stucco cherubs as well as numerous small portraits of the Margravine, her husband and children. The taste for mirrored interiors was also often combined with a passion for ceramics. The Baroque decoration of the room created for Lothar Franz von Schonborn in the Weissenstein Palace, Pommersfelden (1710–18) features intricately carved panelling and ornament and a wonderful inlaid floor as well as oriental pottery displayed beside and above the mirrors and on console tables.

Similarly Georg Wenceslaus van Knobelsdorff's mirrored interior at the Palace of Charlottenburg contains numerous pieces of Chinese porcelain set against a background of mirrored walls. François Cuvilliers's Spiegelsalon in the Amalienburg Pavilion, by contrast, contains mirrors framed by a profusion of splendid, fanciful stucco decoration designed by J. B. Zimmermann whose design exemplifies the exuberance of the full-blown Bavarian Rococo style. This effect is repeated in another celebrated example in the Würzburg Residenz where the Spiegelkabinett features stucco work by Antonio Bossi. The richness and elaboration of these interiors inspired admiration throughout Europe and still appears breathtaking today.

The production of mirrors in England was quite limited for much of the 17th century and was restricted to small plates often of poor quality. Imported Venetian mirrors were expensive, and ownership was limited to the very wealthiest sections of society. Queen Elizabeth I, for example, had used mirrors of rock crystal and *verre cristallin* for her toilet but she also kept a few Venetian glasses in her palaces. In 1618 Sir Robert Mansell was granted a monopoly to manufacture mirrors which he did successfully with the assistance of exiled Venetian craftsmen until 1640. Even so, such was the value of mirrors that they were usually framed to ensure their protection. Gentlewomen embroidered the surrounds of their toilet glasses with designs taken from books such as the *Booke of Flowers, Fruits, Beasts, Birds and Flies* (1658), and after the Restoration in 1660, scenes depicting the king and queen were popular. Many examples survive today thanks in part to the oak boxes that were used to protect the mirrors when in transit or not in use.

In 1662 George Villiers, 2nd Duke of Buckingham, established the Vauxhall Glassworks which virtually monopolised manufacture for the next 14 years. In 1676 the diarist John Evelyn noted that Vauxhall glass was "far larger and better than any that come from Venice" but the plates rarely reached more than three feet in length. An Act of Parliament prohibiting the import of foreign mirrors was passed in 1664 to encourage domestic production, and in the same year the Worshipful Company of Glass-sellers and Looking-glass Makers was incorporated.

From the reign of Charles II, fashionable interiors included mirrors arranged en suite with other furniture, hung above side tables and between pairs of candle stands. For a short period, the most luxurious suites were made of wood overlaid with chased and embossed silver after the fashion at Versailles, and a rare set presented to Charles II from the City of London in 1670 can be seen today in the Royal Collection at Windsor. By the last quarter of the century frames were being made in an enormous variety of woods, and finishes included marquetry, burr and oyster veneers, tortoiseshell and carved limewood. The most celebrated carved frames are those executed by Grinling Gibbons for Petworth House, Sussex. Imported lacquer panels were also incorporated within frames and as the taste for Chinoiserie grew, japanning became popular. Styles reflected current fashions, particularly the tall, elaborate crests featured in the published designs of Daniel Marot. These mirrors, like paintings, were often hung high up on the wall with their tops tilted forward into the room. Others were set into the walls of panelled rooms, and around 1700 the indefatigable country house visitor, Celia Fiennes, recorded seeing

"4 pannells of glass in length and 3 in breadth set together in the Wainescote" in a house in Chippenham, Wiltshire.

Towards the end of the 17th century the Baroque square-shaped mirror had evolved into the taller, more elongated form favoured in pier glasses. This shape was achieved by joining two mirror plates together, often with a bevelled join. By 1700 it was possible to make glass plates of considerable size and clarity; the Bear Garden Glass House at Southwark advertised mirrors "of lively colour, free from Bladders, veins and Foulness incident to the large plates hitherto sold" in 1702.

As furniture generally became more opulent, ornate gilt frames became increasingly fashionable. The onset of Palladianism (c.1730) saw the introduction of frames richly picked out with details derived from classical antiquity, often centred on the pediment by an idealised mask or double shell motif. William Kent, the chief exponent of this style, designed furniture and interiors as unified schemes with heavy, symmetrically-shaped mirrors set above console tables, their design directly inspired by the architectural setting. The advent of the Rococo heralded a fashion for lighter, asymmetrical and organic forms and the structure of frames became fused with or subordinated to the pierced curves and C-scrolls characteristic of the style. Glass was cut to fill the swelling contours of the new, gilded frames which, together with the taste for white walls and tall windows, combined to create a new feeling of weightlessness and airiness in rooms. This fashion was popular on both sides of the Channel, and at its height, frames were covered with a plethora of fantastic Chinese- and Gothic-inspired ornament, as can be seen in the work of an English designer like Thomas Johnson and equally in that of French designers such as Juste-Aurèle Meissonnier and Charles La Joue.

From c.1765 the Rococo was superseded in England by a taste for more restrained classical ornament on linear, architecturally-inspired frames. This style was exemplified in the work of Robert Adam. Mirrors of this period were rarely subdivided, and the proportions and decoration of frames were once again carefully designed to accord with the architectural style of the surrounding interior. The oval shape became more popular, and favourite decorative features were vertically tapering garlands tied with ribbons, paterae, urns and the honeysuckle motif. Technical improvements included the introduction of plate glass via the establishment of the British Cast Plate Glass Manufacturers in 1773, but the doubling of excise duties on raw materials in 1777 meant that glass remained an expensive commodity.

The fashion for French-inspired Empire styles encouraged a taste for convex circular mirrors. Enclosed in gilt and ebonised frames, studded with ball ornaments and often surmounted by an eagle, these became the most popular type of mirror during the Regency period and they were much admired not only for their decoration but also for the effect of their distorted reflections.

The mid- and late 19th century was characterised by the seemingly indiscriminate revival of myriad past styles. Technological developments included a technique perfected by François Petit-Jean in France in 1857 which replaced the lead backing with a backing made of silver. This enabled the production of much clearer glass. It also had a less damaging effect upon the health of the glassmakers, and the technique

was quickly adopted in England. Despite, or perhaps because of manufacturing improvements of this kind, mirrors lost much of their exclusivity during this period. Thousands were made with mass-produced gilt composition frames, many of which followed the popular French Rococo and Renaissance revival styles. Indeed, the mirrored overmantel, or large gilt-framed glass over the fireplace, became ubiquitous in many middle-class Victorian homes. And mirrors also appeared in wardrobes and in other pieces of furniture. Although hugely popular, such conventions were scorned by more progressive designers. Adherents of Arts and Crafts and Aesthetic styles of furnishing criticised the large expanses of glass as cold and ugly and their frames epitomised the meretricious use of ornament that they abhorred. In their place, they advocated a return to smaller, simpler shapes, and the Queen Anne revival brought with it a return to convex mirrors, or plain, painted wooden frames.

During the 20th century mirrors have also been adapted to both fashionable and avant-garde styles. Continental designers working in the Art Nouveau style produced finely-wrought frames made of precious metals, inlaid with woods and enamels, and featuring distorted shapes and sinuous decorative patterns. Exponents of the Art Deco and Moderne styles also prioritised the role of mirrors within interiors. The Moderne style, in particular, which favoured clean, smooth lines and shiny modern materials such as chromium-plated steel and tubular aluminium, also promoted the use of reflective surfaces and introduced large areas of mirrored glass into both wall decoration and furniture. Individual mirrors were often stepped or circular in shape and frames were either dispensed with entirely or were restricted to a thin metal band. Pastel-coloured glass, especially pink and peach, was popular during the 1930s and the semi-circular or sunburst form was a standard feature in many Jazz-age suburban homes. In more exclusive interiors of this period, mirrored table tops and shelving were used to create an atmosphere of glamour and luxury, and several architect-designers designed rooms entirely encased in glass. Raymond McGrath's interiors in Finella, the house that he refurbished in 1930, were entirely reflective, with ceilings of green glass; Syrie Maugham's celebrated "All-White" drawing room included a large chromium and mirror screen across the entire length of one wall; and Oliver Hill's entrance hall at Gayfer House for Lady Mount Temple (c.1931) consisted of mirror-glass from ceiling to floor.

Mirrors have become an integral part of the interior architecture in the work of High-Tech and Minimalist designers of the late 20th century. This is particularly evident within the cool, ultra-modern commercial spaces designed by architects such as Eva Jiricna and Norman Foster where large sheets of plain, mirrored glass are used both to create an illusion of additional space and to emphasise the stark modernity of the interior design.

Mission Style

During the end of the 19th and the early decades of the 20th centuries, the term Mission style came to characterize those structures, interiors, and furnishings that were purportedly based upon the early Franciscan missions of the American Southwest. As William Morris and his followers looked to Europe's medieval past for inspiration, certain proponents of the American Arts and Crafts movement sought their own particular rustic stylistic tradition and related this vision to the missions' weathered adobe finishes, hand-hewn wood, and simple, direct furniture designs. A radical alternative to the prevalent excesses of traditional Victorian interiors, elements of the style spread quickly beyond their characteristic roots in the West throughout the Midwest and East, bolstered by romantic images of a native architecture fully in harmony with nature. Publications such as Charles Fletcher Lummis's *Land of Sunshine*, and later Gustav Stickley's *The Craftsman*, endorsed this idealized vision of a Native American and Hispanic past through admiring essays on the original missions as well as their later derivations. Often these articles praised

the “sturdy and primitive forms” for their “simplicity” and “sincerity”, all in accordance with Arts and Crafts ideology.

As a reflection of some of the earliest extant architecture in the United States, Mission style was typically portrayed as a contemporary solution to a truly American source of design, one that held little relationship to traditional European or classical precedents. Symbolically linked to the Arts and Crafts movement and to 19th-century stylistic exoticism, Mission style's early functionalist designs ultimately served to inspire a new generation of Modernists that sought similar aims in the reduction of ornament, but through a machine-age aesthetic rather than a vague association with a pseudo-historic past.

Early Mission style structures, such as A. Page Brown's California Building for the 1893 World's Columbian Exposition in Chicago served to link the public's view of the developing style as one specifically indebted to the love of handicraft and the architectural heritage of the American Southwest. Throughout the following years other large public and private buildings occasionally developed around a Mission scheme, such as the expansive Glenwood Mission Inn (c.1900) in Riverside, California, but for the most part, the particular appeal of Mission style resided within its contribution to the development of the Arts and Crafts home.

Mission interiors were typically characterized by plain or paneled walls, exposed wooden beams and structural members, and occasionally, arched arcades or windows. Rooms were finished in natural tones, accentuated with linear arrangements of simple wooden trim and the occasional rich colors of decorative pottery vessels and tiles. Wall surfaces might include a painted frieze executed in a stylized pattern often repeated in other materials such as rugs or other fabrics. Curtains and portières in cotton, wool, or linen with appliqué patterns of conventionalized forms, were usually simply mounted and hung straight, with no attempt at elaborate arrangement. Lighting was characteristically muted, with metal or wood electric sconces, chandeliers, and table lamps providing diffused light through art glass shades. In an effort to appear truly “honest”, furniture often included rectilinear construction, projecting tenons, natural leather coverings, and hand-wrought hardware. Representational carving, painted finishes, or elaborate mouldings were generally avoided. Regional woods were occasionally used, particularly redwood in the Western states, but white oak was considered the material of choice due to its coarse grain and attractive pattern when quarter-sawn. Often denounced as “unsophisticated” by its detractors, the various elements of Mission style succeeded in creating an environment which evoked the lifestyle of a pre-industrial era.

As perhaps the most well known producers of furniture, fabrics, and metalwork appropriate to the style, Elbert Hubbard's Roycrofters and Gustav Stickley's Craftsman Workshops quickly found an eager market through catalog sales of their products. Their work was often labelled as “Mission”, but both entrepreneurs avoided this classification and considered their Arts and Crafts products part of a new stylistic development particularly suited to modern American life. In addition to serving as a vehicle for his line of home furnishings, Stickley's journal, *The Craftsman*, offered articles, house plans, and suggestions for interiors that ultimately were viewed by the public as quintessential representations of the

Mission aesthetic. Even as Stickley eschewed a direct association with the heritage of the American missions, he was not hesitant to describe the hand-made rugs and pottery of Native Americans as particularly suitable accompaniments for his furnishings. To Americans already fascinated with the romantic image of the untainted “noble savage”, the appeal for these products was apparent.

Inspired by the success of Stickley and Hubbard, within a few years almost every major furniture manufacturer offered their own Mission style furnishings, more often than not of poor quality construction and corrupted design. Ironically, increased competition eventually necessitated Stickley's acceptance of the use of the machine to reduce costs. Violating Morris's edict regarding the hand-made, he quickly justified the decision, claiming that it freed the craftsman from monotonous labor, permitting him to concentrate on more important detail work. Even as Stickley and others continued to increase their output to satisfy the growing demand for their work, other individual craftspeople and small firms emphasized the spirit of the Arts and Crafts movement through the limited production of exquisitely handcrafted pottery, metalwork, fabrics, and furniture reflecting a variety of stylistic influences beyond that of basic “mission” characteristics.

As periodicals such as *The Craftsman*, *House Beautiful*, *Ladies Home Journal*, and *Home Decorator and Furnisher* disseminated the concepts and images of the Arts and Crafts movement, in the Southwest where mission structures were more familiar, some architects and designers created forms which were more readily identified as designs wrought from the region's Spanish colonial past. Architects such as Hazel Waterman, Irving Gill, and Frank Mead created stucco, concrete, and adobe structures which successfully recalled images of indigenous design, yet were clearly modern in their lack of ornamentation, plain wall surfaces, and innovative construction techniques. Nonetheless, rustic furniture, extensive expanses of exposed wood, and soft natural colors betrayed their debt to the characteristics of the Arts and Crafts movement.

By 1915, the failure of the Arts and Crafts movement to initiate social and political reform in America or England, and the commercial separation of moral philosophy from the product had relegated the concept of Mission style to that of a mere fashion. In the same year, Stickley's overexpansion forced a declaration of bankruptcy and Hubbard and his wife were lost with the sinking of the *Lusitania*. Only a few years later, the production of Mission furnishings ceased completely. Although the specifically Southwestern imagery of the missions failed to establish a universal American style of design, the style's incorporation within the diverse influences of the American Arts and Crafts movement did help to create an enduring interest in the reduction of ornament and an emphasis on functionality that would serve as the basis of the Modernist idiom throughout the following decades.

Mix and Match Colour Schemes

An integral part of the aesthetics associated with the “Contemporary” style, mix and match colour schemes were a new visual phenomenon of the early post-war period which had a major impact on domestic interior design during the 1950s. The term “mix and match” is self-explanatory: it means the availability of a wide range of different colourways, and freedom of choice in the selection of colour combinations. Artistically the ideas behind “mix and match” colour schemes were derived from the abstract paintings of Piet Mondrian, and the work of the architect Gerrit Rietveld and the De Stijl group in Holland during the inter-war period. It was these artists and designers who first introduced pure primary colour contrasts into their work. In the case of Rietveld these aesthetics were applied both to his furniture design and to his buildings, the most complete example being the Schröder House in Utrecht of 1924, where bold primary colour contrasts were used throughout the interior. These aesthetics also affected the work of other artists such as Leger, Matisse, and the sculptor Alexander Calder, and later they began to have an influence on architects of the early post-war period such as Charles Eames, who applied these colour principles to the decoration of his new home in Los Angeles, completed between 1945 and 1949.

As a concept applied to domestic products, mix and match colour schemes first originated in the USA during the 1930s around the time when Russel Wright developed his multi-coloured American Modern tableware range, in which individual pieces were available in a variety of monochrome glazes. Harlequin and Fiesta dinnerwares and teawares, in which each place setting was in a different rainbow colour, also became

popular in the USA during the 1930s. Later, during the early post-war years, similar decorative principles were applied to Eva Zeisel’s Town and Country range for Red Wing Pottery in the USA, and to Kaj Franck’s Kilta tableware for Arabia in Finland. From the late 1940s onwards, however, the concept of mix and match was greatly extended, as it began to be applied to a much wider range of domestic products and accessories, including furniture and lighting. By the mid-1950s it was so well-established that it was being promoted by magazines such as *House and Garden* as the basis on which to select paint colours, wallpapers and soft furnishings for the home.

The widespread adoption of mix and match colour schemes during the 1950s reflected the radical change in aesthetics and in public taste that had taken place during the war years. Their popularity was a reflection of the feeling of liberation and exhilaration experienced by many people at the end of the war: bright colours, particularly primary or acid colours, were a symbol of the new optimism, while the juxtaposition of contrasting colours represented an incitement to jollity and playfulness. The fashion for mix and match colour schemes during the early 1950s represented a conscious act of rebellion against the drabness of the war years, when choice had been almost non-existent and colour and pattern were in short supply. During the first half of the 1940s shortages of materials and labour had meant that, even in those countries not directly affected by the hostilities, manufacturing industry in the field of the applied arts and domestic design had been greatly reduced. In some countries, such as Britain, output had been further restricted by government-imposed legislation, so that only what were considered the basic necessities were produced and decoration was reserved exclusively for goods for export. At the end of the war this situation did not suddenly change: labour and materials shortages continued for several years, and in Britain rationing and the Utility scheme remained in full force until as late as 1951. In Britain in particular, therefore, mix and match colour schemes – first seen in force at the Festival of Britain in 1951 – were a potent symbol of the end of austerity and the start of a new age. When freedom of choice was officially allowed again, and when a full range of goods became available in the shops once more, the popular choice was not just for bright colours, but for the extremes of mix and match.

Mix and match colours were applied to a variety of “Contemporary” domestic products as well as to interior decoration and furnishing schemes. The new aesthetic affected the appearance of many different kinds of furniture, fixtures and accessories in the home, as well as crockery and glassware. A good example of the way in which the scheme worked was its application to the Jason range of bent plywood chairs designed by Carl Jacobs for the British firm Kandya in 1951. These could be purchased in a range of different coloured spray-painted finishes including blue, red, white and black, and customers were actively encouraged to purchase a mixture of colours. Later, when the new range of moulded plastic chairs designed by Charles Eames for Herman Miller came on the market in the USA, they were produced in a range of nine different colours. For upholstered furniture customers were given a free rein in choosing their own personal combinations of fabrics when it came to covers and cushions. In the case of the Marshmallow Sofa designed by George Nelson Associates

Mix and Match: *Marshmallow* sofa by George Nelson for Herman Miller, 1956

for Herman Miller in 1956, which was composed of eighteen circular padded cushions supported on a metal frame, the cushions could be upholstered in a range of different coloured vinyl fabrics, either all in the same colour or in a mixture of colours to suit the customer's taste. A combination of pink, orange and purple was a popular choice.

Lighting was another area of interior design in which colour choice could be exercised, and mix and match colour schemes were particularly apt for light fittings with multiple shades. Tripartite branching floor lamps and dual wall bracket lamps with metal shades in contrasting colours were typical of the type of lightfittings popular at the time. In Italy the lighting designer Gino Sarfatti based virtually the entire output of his firm, Arteluce, on the principles of mix and match, one of his most famous designs being a pendant lightfitting resembling a Calder mobile, in which each set of cupped perspex lampshades was produced in a different colour. Mix and match colour schemes were also applied to many of the ball-and-spoke structure domestic accessories produced during the

1950s in Britain, including coat peg racks, umbrella stands and magazine racks. These accessories were inspired by scientific models of molecular structures, where different coloured balls were used to represent different types of molecules.

Interior decoration was also influenced by the concept of mix and match, the fashion for which affected the selection of wallpapers and paint colours as well as floorcoverings and curtain fabrics. In Britain Marley Tiles produced a range of multi-coloured speckled floor tiles called Harlequin, for example, while paint manufacturers actively promoted their new "Contemporary" colours. During the 1950s fabrics and wallpapers were produced in an increasingly wide range of colourways, and instead of using a single wallpaper pattern in a room, people were encouraged to use two or more contrasting patterns on adjacent walls. A mix and match interior scheme might also consist of a combination of plain painted walls and patterned wallpapered walls. Sometimes this even extended to the painting of the woodwork, with each door in the house being painted a different colour.

Mix and match colour schemes were an essential part of the “Contemporary” aesthetic. By the early 1960s, however, not only had tastes in colour changed, but so had ideas about the number of colours that could be used together in an interior, and which colours it was considered permissible to combine. Not surprisingly, therefore, before long there was a strong reaction against mix and match colour schemes; it was a fashion that was much too extreme to remain popular for long.

Modernism and the Modern Movement

In broad terms the Modern Movement can be seen to have developed in two main phases. The first has been seen as a pioneering phase, originating in the debates of design reformers in the 19th century but essentially centred upon the period from the years immediately prior to World War I through to the early 1920s. This was followed by the International Style, which could be seen to run from the later 1920s through to the 1960s, when Postmodernism emerged as a powerful critique. Although perhaps most visible in terms of its architectural achievements, the Modern Movement nonetheless made a considerable impact across the design spectrum, from typography to textiles, kitchens to ceramics and flooring to furniture. Essentially the Modernist aesthetic was opposed to the use of ornament and focused on notions of standardisation, the exploration of new materials, abstract forms and an apparent (or symbolic) compatibility with the possibilities of modern mass-production technology. Plain surfaces, geometric forms and materials such as glass and metal (especially chromium-plated tubular steel) were particular favourites of Modern Movement designers and were usually deployed within a context of restrained colours (preferably white, off-white, grey and black) and the abstract manipulation of light and space. However, this implicit commitment to a means of expression which embodied the *Zeitgeist*, or “Spirit of the Age”, was in turn accompanied by a drive to utilise a creative vocabulary redolent of the Functionalism of the early 20th century. But such “functionalism” was often far more symbolic than material.

The Modern Movement was also highly charged with a sense of social Utopianism as its proponents sought to bring about a better material and aesthetic quality of life for the majority through the implementation of housing and design programmes embracing the new forms, particularly in

Germany and Holland. However, in the increasingly turbulent social, political and economic climate of the later 1920s and 1930s, architects and designers promoting Modernism came under increasing attack. Through its rejection of historicism alongside its embodiment of standardised, seemingly rational and modern abstract forms, their work was seen by critics to be opposed to national (and thus historically-charged) characteristics in architecture and design. Accordingly, it came under particular attack from the National Socialist Party under Adolf Hitler in Germany and the repressive climate of Socialist Realism under Josef Stalin in the USSR. Nonetheless, although often attracting the kind of abuse reserved for those committed to policies to the left of the political spectrum in Britain, France and the United States, the Modernist aesthetic was also explored by designers more geared to the tastes of a sophisticated elite than to bringing about any radical change in the demands of the mass-market.

A number of possible spiritual and historical antecedents of the Modern Movement were proposed in Nikolaus Pevsner's celebrated book of 1936, *Pioneers of the Modern Movement* (later revised as *Pioneers of Modern Design*). These were seen to originate in the efforts of design reformers who, from the 1830s onwards, attacked the ways in which contemporary manufacturing industry plundered the past to reproduce a wide variety of historical styles for the decoration of designed products, regardless of context and appropriateness. The resulting goods, when they were not simply dismissed as shoddily made, were generally seen as showy demonstrations of technical virtuosity rather than embodiments of an appropriate and “honest” use of materials. In Britain in particular, a perception of the detrimental impact of industrialisation was an implicit part of such an outlook, whether in terms of the squalid conditions endured by many in the rapid growth of the urban environment or the apparent shackling of the creative spirit of workers involved in the production of goods for everyday life. These workers, through the impact of the division of labour in the factory system, were felt to be increasingly deprived of any sense of fulfilment in their involvement with the manufacture of things. William Morris, one of the most influential figures involved in such critiques of the industrialisation process, did much to promote an alternative *modus operandi* which looked back to the Middle Ages and the social and artistic values inherent in craft production. The resultant Arts and Crafts movement, engendered by such thinking, was seen by Pevsner and others as a major formative influence on the design outlook in Germany in the closing years of the 19th and early 20th centuries. There a number of *Werkstätten* (Workshops) were established which sought to reconcile the skills and expertise of crafts workers with a spirit of creativity in design. Although acknowledging a belief in the superiority of hand-made furnitures and fittings, the more successful of these groups, such as *Dresdener* and *Vereinigte Werkstätten*, also forged a more positive relationship with industry, accompanied by a stronger sense of commercialism and the capacity for considerable productive output. Typifying this reconciliation of artistic endeavour with machine production were Richard Riemerschmid's furniture for the *Dresdner Werkstätte* of 1905 which, with its clean, simple lines, was produced in sufficient quantities and at a price attractive enough to command wide market possibilities.

Whether or not Pevsner's genealogical explanation of the roots of the Modern Movement is entirely convincing, it is clear that by the turn of the century there was considerable interest in design circles in the appearance of functional objects such as bathroom fittings, railway locomotives, machines and engineered structures. Highly significant in the genesis of the Modern Movement was the formation in Germany in 1907 of the *Deutscher Werkbund*. This was prompted in part by the practical ethos and symbolic functionalism of the room settings and furniture seen at the 1906 Dresden Exhibition of Applied Arts and, perhaps more importantly, by a growing belief in progressive circles in the tempering of artistic idealism with the economic and technical determinants for the design and production of consumer products.

The *Deutscher Werkbund*, an increasingly influential grouping of industrialists, designers, politicians and others interested in design reform, sought a more radical reconciliation of aesthetic sensibilities with the possibilities of new materials and modern mass-production technology than that exhibited by the majority of *Werkstätte* designers. However, despite strenuous efforts to promote the cause of modern design through the mounting of exhibitions, conferences and publications, dramatic headway was limited in the face of the innate conservatism of most manufacturing industries. Accordingly, it was decided to promote the organisation's aims more forcefully by mounting an exhibition in Cologne in 1914. As a coherent exposition of the progressive functional aesthetic associated with standardisation, the exhibition was far from an unqualified success. As well as the display of interiors which looked to the past, such as Runge and Scotland's café-restaurant or Paul Ludwig Troost's neo-Baroque dining room, perhaps this also reflected something of the ideological split between Hermann Muthesius and Henry van de Velde. The former was committed to embracing standardisation in machine production while the latter felt that such an outlook essentially compromised the designer's spirit of creativity. However, the 1914 Cologne exhibition has been remembered generally by design historians for the uncompromising clarity of form and structure of the heavily-glazed *Werkbund* buildings designed by Walter Gropius and Adolf Meyer. Through the manipulation of space, light and abstract geometric form these were important exemplars of the early phase of the Modern Movement.

The quest for the production of uncompromisingly modern forms which escaped the clutches of historicist reproduction was echoed strongly in the writings of the Austrian architect, furniture and interior designer Adolf Loos. Also an important writer and theorist, he expressed an unequivocal commitment to a functionalist aesthetic in what has often been seen as his most important essay, "Ornament und Verbrechen" (Ornament and Crime), of 1908. Here he depicted ornament as irrelevant in modern life as it had "ceased to be a valid expression of that culture. The ornament that is designed today has no relevance to ourselves, to mankind at large, nor the ordering of the Cosmos. It is unprogressive and uncreative". Reprinted in Le Corbusier's magazine *L'Esprit Nouveau* in 1920, this proto-Modernist outlook can be linked to the development of more full-blooded Modern Movement thinking in the 1920s.

Important influences on the Modern Movement can be

Modernism: carpet designs by Da Silva Bruhns, 1929

found also in avant-garde circles in the fine arts, whether the Cubist painters in France, the Suprematists in Russia, or those who became involved with *De Stijl* in Holland. Before 1914 the Italian Futurists, both through their uncompromising attacks on their country's historical heritage and their unequivocal commitment to speed, dynamism, and cultural revolution as a way of life, also did much to fuel the ideological motor of aesthetic sensibility tied to 20th-century technological progress, even if their own particular formal vocabulary was distinct in terms of visual expression.

Due to Holland's neutrality in World War I, the spirit of the avant-garde in the visual and plastic arts continued to flourish there, unlike in France and Germany. Perhaps most significant was the thinking associated with the *De Stijl* group, founded by Theo van Doesburg in 1917 and centred on a magazine of the same title. Building on the work and thought of the Dutch painter Piet Mondrian, who had been influenced by Cubism before World War I, there was a commitment to a design vocabulary which emphasised the vertical and horizontal and adopted the primary colours of red, yellow and blue, in addition to black and white. Another important early influence on the group was the Dutch architect H.P. Berlage, whose own manipulation of form and space revealed links with the American architect and designer Frank Lloyd Wright. Early interior design work associated with the *De Stijl* aesthetic which explored rectilinearity and the use of primary colours included stained glass windows, tiled floors, mosaics and colour schemes by van Doesburg; Bart van der Leek and Vilmos Huszár produced textile designs and, in furniture design, a similar spirit was embraced in the work of Gerrit Rietveld. However, by the early 1920s, the *De Stijl* aesthetic took on a more international profile as Modernism generally began to attract more critical attention. Representing a more mature phase of expression, Rietveld's *Schröder House* in Utrecht of 1924 explored the interplay of rectilinear forms with geometric space and presented an aesthetic unity throughout, from the design of the furniture, fittings and interior to detailing on the exterior.

During the same years Russian Constructivism also became prominent in progressive design circles. Its origins may be found in the abstract forms of Suprematist painting, most notably in the work of Kasimir Malevich, and Cubist-inspired sculpture by Vladimir Tatlin. Following the October Revolution of 1917 many avant-garde artists and designers

Modernism: Le Corbusier's Pavillon de l'Esprit Nouveau, 1925 Paris Exposition Internationale des Arts Décoratifs

became involved in many aspects of propaganda for the revolution, including street art, theatre and poster design. By 1920 there were divisions among the avant-garde, which in many ways echoed the same concerns of inner creativity versus standardisation voiced by Muthesius and van de Velde at the Deutscher Werkbund before World War I. Artists such as Wassily Kandinsky (who went on to work at the Bauhaus) and Naum Gabo believed in spirituality and creativity in art untrammelled by notions of practicality, whereas others, including Alexander Rodchenko, his wife Varvara Stepanova, and Tatlin, sought to lend their work a more social and utilitarian direction, linking it with the potential of modern mass-production technology. The latter tendency prevailed and its exponents sought to put their creative efforts towards the regeneration of society. The Russian El Lissitzky was very influential on the Modern Movement, publishing a journal *Veshch* (Object) in Berlin in which he sought to reconcile art with mass-production. He travelled extensively between Russia and Europe in the 1920s, established links with De Stijl and other progressive groups, and was also a strong influence in the shaping of the international dimension to the Modern

Movement. Typical Modernist interior designs of the period were those for workers' clubs, a new building type. Prolific in this genre was Konstantin Melnikov (whose striking Soviet Pavilion at the 1925 Paris Exhibition attracted considerable attention among the avant-garde) who designed five such clubs in Moscow alone. These often had multi-functional rooms and utilised sliding and rising partitions to give a flexible environment with minimal expenditure. Another celebrated workers' club was that contained within Melnikov's 1925 Pavilion, the interior and furniture for which was designed by Alexander Rodchenko.

Although the Modern Movement has a strong international profile, it has perhaps most strongly been identified with German design of the 1920s, most particularly with the ideology and output of designers associated with the Bauhaus, the lifespan of which was almost completely aligned with that of the Weimar Republic and all of the social, economic and political tensions engendered during those years. The early years of the Bauhaus, following its establishment in Weimar under the Directorship of Walter Gropius in 1919, empathised with Expressionism and appeared to be opposed to the drive

towards standardisation which had been so evident in the work of a number of the German avant-garde before World War I. This aesthetic volte-face immediately after the war may well be on account of the subsequent antipathy of many designers to large-scale industry, which was felt to have played an important part in precipitating Germany's involvement in the war. In terms of interior design this early spirit may be seen in the wooden interiors of the Sommerfeld House, designed by Gropius and Hannes Meyer in 1921, complete with elaborate woodcarvings by Joost Schmidt which embraced references to folk art traditions in the details. Yet within two years there was a markedly different feel in the air at the Bauhaus, as evident in the appearance of the interior of Gropius's own office, throughout which the contrast of horizontal and vertical articulated both furniture and fittings. This was particularly apparent in the unornamented light fitting which was designed by Gropius himself. The clean, plain surfaces of the walls and floor were punctuated only by a wallhanging and carpet, both of which explored abstract geometric forms, symbolising notions of standardisation and compatibility with a machine age aesthetic. Such ideas were close in spirit to the activities of designers connected with Constructivism in Russia and Hungary and De Stijl in Holland, although the actual modes of construction were still located within the context of craft, rather than mass-production. This reconciliation with the "industrial" and symbolically "functional" forms of the international avant-garde found more complete expression in the austere functional-looking interiors of the Haus am Horn, designed by Adolf Meyer and Georg Muche, which was a major feature of the 1923 Bauhaus exhibition. Such a commitment to an aesthetic which furthered the possibilities of abstract forms and new materials, wedded to an ethos of modern technology, was even more emphatically expressed in the new buildings, interiors, furniture and fittings at Dessau, where the Bauhaus had been forced to move for political reasons in 1925–26.

Our historical understanding of the Bauhaus, as with many other groups, organisations and institutions associated with the cause of Modernism, has been much enhanced (or perhaps conditioned) by the availability of that institution's series of books, published in the 1920s, which directly promoted the ideas of many designers closely associated with it. Increased attention has perhaps also been paid to both Bauhaus and German Modernism on account of its political repression by the National Socialists in the early 1930s. Many architects and designers working in Germany fled the increasingly oppressive regime and moved to Britain, the United States and elsewhere, thus sharpening debates on, and knowledge of (at least in progressive circles) both the Modernist aesthetic and Bauhaus educational practice. However, for many years after its final closure in 1933, the appearance of Modern Movement design, divorced from its original strong democratic ideals, became increasingly recognisable in terms of style, whether as objects endowed with cultural status in the collections of the Museum of Modern Art in New York, the interior design of the offices of multinational corporations in the United States after World War II, or as objects being accorded Compasso d'Oro design awards by La Rinascente in Italy, Design Centre Awards by the Council of Industrial Design in Britain and similar awards elsewhere in Europe and Japan.

Despite the high profile afforded the Bauhaus in many histories of modern design, the Modern Movement in Germany exerted a marked impact elsewhere in the country, as seen in the design and planning outlook of a number of progressive municipalities such as Stuttgart and Frankfurt. Their involvement came about partly as a result of a general shift away from private to public patronage in Germany in the climate of spiralling inflation of the early 1920s. This presented an opportunity for Modernist architects and designers to put their ideas into practice in a climate which was more favourable to forward-looking concepts such as the *Neue Gestaltung* (New Design), *Neue Bauen* (New Architecture) and the *Neues Wohnen* (New Lifestyle). Magazines such as *Das Neue Frankfurt* and *Das Neue Berlin*, which commenced publication in 1926 and 1929, respectively, argued for recognition of the social as well as aesthetic value of modern architecture and design. In Frankfurt a second publication, the Frankfurt Register, was effectively a catalogue for the promotion of the commercial availability of modern design for everyday life, with sections devoted to lighting, furniture and other facets of interior design. In the same city the architect Ernst May, in charge of the city's municipal housing programme, brought a number of Modernist aspirations to life in the provision of mass housing. These dwellings saw the development of special building techniques and were equipped with functionalist furniture and fittings which were tailored to the practicalities of efficient living in small spaces. Extensive studies were made and standardised forms for all aspects of everyday life became the norm. Typical of the outcome of such investigations was the so-called Frankfurt Kitchen type, the planning of which was achieved by a team working under Grete Schütte-Lihotzky. Its clean surfaces and highly organised, efficient layout was based on the lessons learnt from galleys on ships and railway trains and the writings of Christine Frederick, an American expert on household efficiency who had published a key text, *Household Engineering: Scientific Management in the Home*, in 1919.

Another unambiguous manifestation of Modernism in Germany was the Die Wohnung (The Dwelling) Exhibition held in Stuttgart in 1927. Organised on behalf of the Deutscher Werkbund by the German architect and designer Ludwig Mies van der Rohe on the Weissenhof Estate, Stuttgart, it included housing designs by many of the leading protagonists of the Modern Movement, including Gropius, Le Corbusier, Mart Stam, J.J.P. Oud and Mies himself. The emphatically Modernist forms seen in the architecture, furniture and fittings did much to establish the notion of an "International Style", as critics were able to see that the work of architects and designers from a number of countries, including Germany, was stylistically homogeneous. This gave rise to growing hostility in Germany to an aesthetic that disregarded indigenous traditions; conservative furniture manufacturers attempted to prevent avant-garde furniture by Marcel Breuer and others being shown; Modernist designers and architects were increasingly portrayed as embodying harmful moral and political characteristics, often being associated with Bolshevik, Jewish or other "undesirable" or non-indigenous origins.

Perhaps one of the most complete expressions of a Modern Movement interior can be seen in Mies van der Rohe's German Pavilion at the 1929 Barcelona International Exhibition. Its

Modernism: Marcel Breuer's B64 chair, manufactured by Thonet, 1928

architecture, interior space, furniture and furnishings were completely harmonious and seen as a total unity by Mies and Lilly Reich, who collaborated with him on the project. But, despite its aesthetic coherence and clarity of spatial articulation, it was fashioned from expensive materials such as marble and onyx, and was labour-intensive in its construction, thus embracing a number of ironies with which Modernism was beset: at its core had been a commitment to social utopianist ideals, but in many of its most complete visual expressions, at exhibitions or in commissions from the well-to-do, it was compromised by an underlying sense of wider social irrelevance.

Although modern design was generally suppressed under the Nazis for such reasons as were apparent at Stuttgart in 1927, the design historian John Heskett has argued that standardisation and rationalisation continued to exert an important impact on economic planning, particularly with regard to re-armament and militarization. Guidelines were still produced for neat, functional design in housing, domestic furnishings and equipment, and the work of many Modern Movement designers who had come to the fore in the 1920s, such as Wilhelm Wagenfeld, continued in production throughout the 1930s. The extent to which the Modern Movement could still be seen in Germany as late as 1939 was apparent in that year's official state publication of approved designs in current production.

In France Le Corbusier was the most dominant voice in Modernist circles. An architect, designer, painter, planner and writer, his text, *Vers Une Architecture* of 1923, was a key work in the dissemination of the ideals of the Modern Movement across Europe and beyond. Committed to the poetics of the machine in architecture, he wrote that "the plan proceeds from within to without; the exterior is the result of the interior". At the 1925 Exposition Internationale des Arts Décoratifs et Industriels in Paris the stark, modern aesthetic of his infamous Pavillon de l'Esprit Nouveau encapsulated the opposition

between the prevalent decorative tendencies of the French *ensembliers* (whose extravagant, ornate creations were geared towards the well-off) and the social Utopianism of the Modernists who placed their faith in notions of standardisation, new materials and a firm commitment to the contemporary spirit. Many of Le Corbusier's ideas relating to interior design can be found in his book *L'Art Décoratif d'aujourd'hui* of 1925, first published as a series of articles in his magazine *L'Esprit Nouveau*, in the period leading up to the 1925 exhibition. Here he argued that interior design and furniture should, like architecture, embrace notions of rationalisation and standardization, concepts given life in the furniture, storage systems and paintings (by himself and Fernand Léger) in his 1925 pavilion. Another important statement of Le Corbusier's views on interior design was seen at the 1929 Salon d'Automne, where Charlotte Perriand had joined forces with Le Corbusier and his brother Pierre Jeanneret to exhibit the interior of a complete dwelling, with fittings and furniture fashioned largely from metal and glass, and with spatial arrangements determined by modular storage systems or *casiers*.

In 1930 Modernist designers in France established the Union des Artistes Modernes (UAM). Under the directorship of René Herbst, its members included Le Corbusier, Charlotte Perriand, Robert Mallet-Stevens, Eileen Gray, Louis Sognot, Charlotte Alix and Pierre Chareau. Between 1928 and 1932 Chareau designed one of the most evocative modern interiors of the period in the Maison de Verre. With its exposed steel structure, studded rubber flooring, large expanses of glass and specially designed furniture, the aesthetic commitment to industrial materials linked it firmly to the spirit of contemporary technology. However, this design also encapsulated the social location of much French Modernism – among the metropolitan cultural elite.

Italy's first clear manifestation of the spirit and aesthetics of the Modern Movement was the formation in 1926 of Gruppo 7. The Italians' work became known as Rationalism and was in tune with other aspects of Modern Movement design elsewhere in Europe; they even sent projects to the Weissenhof housing exhibition at Stuttgart in 1927. Closely in tune with the prevailing aesthetic of clean, abstract forms spiritually attuned to modern life, materials and technology, the Rationalists hoped that their outlook would be adopted as the official style of Fascism and, for a while, the Movimento Italiano per l'Architettura Razionale (MIAR) was approved by the Union of Fascist Architects. The battle for the success of the Rationalist cause clearly depended upon winning important public commissions for housing and major buildings as well as for the furniture, fittings and equipment which would accompany them. However, although there was only very limited success in the public sector, there were a number of striking private commissions in the late 1920s and early 1930s, such as Figini, Pollini and Baldessari's interior for the Craja Bar in Milan (1930) and the Parker shop interiors (1934), also in Milan, by Persico and Nizzoli. The plain, light interior of the latter was complemented by the sleek lines of the chromium-plated tubular steel furniture and showcases. These were quasi-abstract configurations of sculptural forms redolent of the spirit of contemporary technology, fashioned by means of a

clearly articulated set of spatial relationships composed from metal tubing and plate glass.

But the main forums for the display of, and debate concerning, modern design in Italy were the Triennale exhibitions (originally Biennali). These were first held in Monza in 1923, moving to Milan ten years later and provided the avant-garde with an opportunity to promote their cause. In the early 1930s the debate was lively. At the V Triennale of 1933, modern interiors were displayed in a variety of individual pavilions. Typical of these were the Villa-studio for an Artist by Figini and Pollini, the form of which, with its exploration of light, space and abstract form, was in tune with avant-garde developments elsewhere across Europe. However, despite boasting chairs elegantly cantilevered from chromium-plated steel, a material also used for the legs of the table, the spacious dining room typified the trend in many of the exhibition houses to cater for a wealthy clientele. There were some exceptions, including the starkly Modernist interior for a school designed by Annoni, Comilli and Masera, again with plain, light surfaces, large steel-framed windows and simple, functional furniture using tubular steel. But, on the whole, such efforts to place the Modernist agenda within the public domain remained unfulfilled as subsequent Triennali in 1936 and 1940, and other exhibitions, continued to provide the major opportunities for the display of Modernist interiors designed for hotels, housing projects and the homes of the comparatively wealthy.

There were a number of instances where Rationalist designers were directly involved with design which promoted the Fascist regime, perhaps the most celebrated example being Giuseppe Terragni's Casa del Fascio of 1933–36. Although utilising many aspects of the Modernist vocabulary, particularly in the geometric articulation of the exterior, the interiors – as in the meeting room – were marked by a more idiosyncratic and almost fussy decorative use of abstract forms on the wall surfaces and the deployment of clearly unfunctional curves in the tubular steel furniture. Such difficulties in reconciling a modern, internationalising aesthetic with the demands of a political regime steeped in notions of a Roma Secunda and visual reference to the trappings of the grandeur of Ancient Rome were rarely overcome in the 1930s. Indeed, by 1938 the forging of close links with the Nazi regime in Germany led to the final stifling of the Rationalist cause in Italy until democracy was restored at the end of World War II.

In Sweden between the wars the Modern Movement also made itself felt, largely stimulated by the activities of the Svenska Slödföreningen (Swedish Society of Industrial Design). Although founded in the 19th century, it was not until the 1910s that the Society began to promote forcefully the development of links between artists and industry. As with the Deutscher Werkbund, with which it had developed links before World War I, the Svenska Slödföreningen sought to raise the quality of life through improved standards of design in everyday life. This was marked by the mounting of the Home Exhibition in Stockholm in 1917 in which 23 fully-furnished interiors were displayed by young architects and designers. As was apparent in Gunnar Asplund's kitchen-living room, the designs were clearly imbued with the flavour of crafts production, although the simplicity of form and restrained decoration were compatible with the possibilities of industrial production

(rather as Riemerschmid's furniture had been at the Dresdner Werkstatte in the early 20th century). Despite the exhibition and the publication in 1919 by Gregor Paulsson (Svenska Slödföreningen's director) of *More Beautiful Everyday Things*, which became something of a yardstick for Swedish designers in the inter-war years, there was something of an ambiguous commitment to Modernism during the 1920s. There was, however, an increased awareness of developments in Scandinavian, particularly Swedish, design, brought about by the 1923 Gothenburg and 1925 Paris Exhibitions, which gave rise to notions of "Swedish Grace". Typical of this were interiors by Carl Malmsten which, although they acknowledged traditional forms and materials, displayed a sense of elegant simplicity in their restrained use of decoration. By the late 1920s there had emerged two major strands of Swedish design: the first of these was promoted by Asplund and Paulsson and the Svenska Slödföreningen, which was clearly allied to the social utopianist ideals of the German avant-garde; the second was seen in the glass and ceramics industries which were still heavily inclined towards an aesthetic rooted in the arts and crafts. This gave rise to considerable tensions between those representing the *funkis* and *tradis* outlook, that is, the functional and the traditional. The 1930 Stockholm Exhibition was an unequivocal affirmation of the former.

Rather like the 1927 Weissenhof exhibition at Stuttgart, Stockholm 1930 was an unambiguous affirmation of faith in the contemporary spirit. But in addition it was closely allied to advertising as an important aspect of 20th-century life, as it was seen to epitomise the dynamism of modern life and provide the means of forging links between design, industry and the consumer. The exhibition embraced all aspects of contemporary life from transport and communications to housing; furnished flats and interiors were displayed alongside exhibits relating to schools and hospitals; Modernist concepts of standardisation and mass production were very much to the fore and, as Paulsson proclaimed, "the fundamental changes which have taken place in the technical and social structure of our society are in the process of creating a *zeitgeist*, philosophy of life, or whatever we like to call it ... the much discussed functionalism is – unconsciously – an essential part of this new attitude to life". Typical interiors which, like German counterparts in the 1920s, sought to make the maximum use of minimum space, included a bedroom by Sven Markelius with light, plain walls and floor, equipped with a simple functional desk, tubular steel chairs and bed, and practical adjustable shelving, and an economically-designed kitchen and dinette for a rented flat by Erik Friberger. New applications for materials were also in evidence, as in the extensive use of stainless steel for kitchen surfaces, as well as equipment, seen in the Osterberg & Lenhardtsson kitchen. Although more openly acknowledging traditional materials and forms in the furniture, albeit used in a very straightforward manner, the living room by Uno Ahren was similarly geared towards a more practical, functional lifestyle through the versatility of its elements: a sofa-bed, adjustable armchair and lamp, and expandable bookshelves.

Opposition to the rather stark and austere qualities of the aesthetic which dominated at the Stockholm Exhibition was fairly fierce, and led to considerable debate in design circles. In 1931 Svenskt Tenn held an exhibition at the Galerie Moderne

with interiors and furniture designed by Ahrén and others in conjunction with the Svenska Möbelfabrikerna which were rather more muted in their Modernist tone. This was followed by a number of other exhibitions mounted by Svenska Möbelfabrikerna and others, such as the Modern Home Exhibition of 1933, where the clarity of space in the interiors was tempered by furniture and equipment that blended Modernism with more traditional forms. During the 1930s this rather more humanising trend in which natural materials were far more extensively deployed in the cause of Modernism gathered pace. This style, which became known as Swedish Modern, was typified by the work of Bruno Mathsson and the Viennese architect-designer Josef Frank, who settled in Sweden in the early 1930s, and became increasingly familiar to a wider international audience through the design press, exhibitions and export.

Similar trends were evident in design elsewhere in Scandinavia where the modern spirit was tempered by the "humanising" use of natural materials. Among the most celebrated of such designers was the Finnish architect Alvar Aalto, whose designs for buildings were complemented by interiors, furniture and equipment that were entirely consistent with the aesthetic. Like other Modernists he was concerned with the development of designs which explored the possibilities of maximum efficiency in minimum space. His interior furnishings for a living room with dining alcove and bedroom at the 1930 Minimum Apartment Exhibition in Helsinki Town Hall typified this approach; his wife Aino designed the related minimum kitchen, which included a rubbish bin on wheels and tables with extendible surfaces at which the person preparing meals could work. Aalto attracted international attention in his furnishing of the Paimio Sanatorium which, through its custom-designed interiors, fittings and fitments (embracing everything from lighting fixtures to drinking glasses) has been seen as an aesthetic unity. Aalto's sensitive and elegant use of plywood in furniture, architecture and interiors drew favourable comment and widespread notice in the displays in a number of international exhibitions, including the V and VI Triennali in Milan of 1933 and 1936, the Paris International Exhibition of 1937, and the New York World's Fair and San Francisco Golden Gate Exhibitions of 1939.

Britain was also susceptible to the influence of the Modern Movement, although its presence and vitality were rather less marked than the position proffered by many histories of British design. In 1929 Dorothy Todd and Raymond Mortimer published *The New Interior Decoration* which revealed the relative suspicion of Modernism in the work of many British designers. However, from the late 1920s onwards, increasing attention in Britain was paid to avant-garde developments in Europe, and articles about it appeared in periodicals such as *The Architectural Review*, *The Architect* and *Building News* and, a little later on, publications emanating from the Design and Industries Association (DIA), such as *Design in Industry* and *Design for To-Day*. However, the DIA, founded in 1915, was a pale British reflection of the larger and more powerful Deutscher Werkbund and its (often luke-warm) embrace of Modernism never impacted upon British manufacturing industry in the same way as its counterpart had in Germany in the mid 1920s. The British state was also involved in promoting a greater consciousness of design in manufacturing industry and

the domestic marketplace through the setting up of the Gorell Committee by the Board of Trade. The subsequent report, *The Production and Exhibition of Articles of Good Design and Everyday Use*, was published in 1932 and marked the beginning of a series of initiatives to promote modern design. In terms of interior design this was to be seen in a series of promotional exhibitions during the rest of the decade: at Dorland Hall, London, in 1933, there was an exhibition of industrial design relating to the home which included the full-size reconstruction of the interior of a Minimum Flat by the architect-designer Wells Coates, based on one of his apartments from the Lawn Road Flats development in Hampstead. In common with the ideas of the European avant-garde (minimum space was discussed extensively at the 1929 Congrès Internationaux d'Architecture Moderne conference in Frankfurt), he explored ideas of space-saving and included built-in furniture, a concept that was pushed to extremes in the kitchen-galley and bathroom / dressing room. These measured only five feet in width and were separated from the main living space by a sliding door. The prevailing aesthetic of this Minimum Flat was austere and functional, complete with cantilevered chromium-plated tubular steel chairs. Indeed, the Lawn Road Flats may be seen as an important rallying point for the Modern Movement in Britain. The flats were funded by Molly and Jack Pritchard of the progressive Venesta Plywood and Isokon furniture companies; the early tenants included a number of European Modernist émigrés including Walter Gropius, Marcel Breuer and László Moholy-Nagy. Breuer and Gropius also designed furniture for Isokon before moving on to the United States.

The British Broadcasting Corporation (BBC) also helped to promote the spirit of Modernism in Britain during the 1930s. This came about not only through the commissioning of leading Modernists such as Serge Chermayeff, Wells Coates and Raymond McGrath to design functional interiors and furniture for the new Broadcasting House in London, erected between 1928 and 1932, but also through the broadcasting of a series of talks and debates on design in daily life in the early 1930s. Despite the formation of avant-garde groups such as Unit One, founded in 1933 to promote modern art and architecture in Britain, and the publication of propagandist texts such as Herbert Read's *Art and Industry* in 1934, design which fully endorsed an uncompromisingly modern aesthetic was never widely accepted in a country where the lure of the past, heritage and Empire found much more visible expression in the widespread mock-Tudor architecture and interiors of the burgeoning suburbs than the sleek Modernism of housing for the more wealthy. Nonetheless, there were a number of essays in Modernism in the public arena in which Modern Movement architecture and interior design had a marked presence. These ranged from the co-ordinated design policy of London Transport, seen in the modern underground stations of the Piccadilly Line, as well as signage, litter bins and other miscellaneous detailing. Quite a number of retailing outlets also experienced the impact of the Modernist spirit, as in the Cresta Silks shops in the south of England, designed by Wells Coates, or London stores such as Simpson's of Piccadilly by Joseph Emberton or Peter Jones in Sloane Square, by Slater and Moberly. The architecture of leisure boasted a number of striking modern interiors, as in Erich Mendelsohn and Serge

Chermayeff's De La Warr Pavilion at Bexhill-on-Sea of 1935–36. Two fields in which the original socially-oriented impetus of Modernism found some means of expression were in the building of health centres, which sought to integrate social as well as medical functions, and the development of social welfare and recreational facilities for mining communities. The former included the Finsbury Health Centre by Lubetkin and Tecton and the Pioneer Health centre by Sir E. Owen Williams at Peckham (with heated swimming pool, reading room and other leisure-oriented facilities); the latter, co-ordinated through the Miners' Welfare Committee Architects' Department looked to Continental examples, particularly the work of Dudok in Holland, and produced many striking examples of modern architectural and interior design.

In Eastern Europe the Modern Movement also made its presence felt. In Poland there a number of designers associated with the spirit of Constructivism who, based in Warsaw, were particularly critical of what they felt to have been a backward-looking, craft-oriented national display at the Paris 1925 exhibition. Mieczysław Szczuka was a key figure of the group which was centred around their journal *Blok*, established in 1924. Increasingly bitter debates centred on the relationship between art and design, between artistic creativity and its subordination to the economics of mass-production technology. This led to the disintegration of the group, a number of whom became members of Praesens, an internationally oriented group focused around a journal of the same name, which saw Modernist architecture at the root of a social and aesthetic revolution. During the later 1920s the group consolidated links with other European Modernists, particularly through its membership of the Congrès Internationaux d'Architecture Moderne (CIAM) from 1928 onwards. Stimulated by the 1929 CIAM meeting in Frankfurt where notions of living in the minimum space had been fully explored, a Minimum Flat Exhibition was mounted in Warsaw in 1930. A key designer and leading figure of Praesens, Simon Syrkus, exhibited an interior with tubular steel furniture prototypes, including a foldaway bed. Decidedly functionalist and utilitarian, it was in tune with radical practice in Germany. Another Modernist success at the exhibition was the interior designed by Stanisław and Barbara Brukalski which explored the possibilities of standardised wooden components as industrial prototypes for working-class furniture. However, as was the case in a number of other European countries, the number of opportunities to implement the Modernist agenda was limited on account of the prevailing economic conditions, and the majority of achievements were confined to houses and apartments for the wealthy. There was a move away from the more internationalising tendencies towards a position in which the Modernist spirit was tempered with a greater acknowledgement of vernacular and regional considerations.

Eastern European educational establishments were important sources for the spread of Modernism, just as the Bauhaus had been in Germany. For example, in Russia the Moscow Vkhutemas school of design had been an important stimulus for Constructivist debate in the early 1920s, and in Poland the School of Architecture at Warsaw Polytechnic proved a powerful advocate of the new spirit in design. There were other educational institutions which were modernising in their

educational philosophy as, for example, the Bratislava School of Applied Arts, founded in Czechoslovakia in 1928 under the directorship of Josef Vydra (1884–1959). Links were established with the avant-garde in Germany, France and elsewhere and its aim was to modernise, and raise standards of, domestic manufacture to a level comparable with wider international comparisons. This modernising outlook was addressed in relation to house design and furnishing and there was a close relationship between architecture, the applied arts and industrial production. Paralleling the German magazines which promoted modern architecture, life and design, such as *Neue Frankfurt*, Czechoslovakian aspirations were reflected in a similarly oriented review, *Nová Bratislava*, which contained many photographs of functionalist interior design. However, as in Germany a few years earlier, the oppressive political climate of the late 1930s forced the school to close its doors in 1939.

The impact of the Modern Movement also made itself felt to a limited extent in Japan in the inter-war period, the rebuilding of Tokyo after the Kanto earthquake of 1923 providing an opportunity for the consideration of new ideals. Progressive ideas were articulated by key figures in the evolution of Modernism, such as Frank Lloyd Wright, Bruno Taut, Richard Neutra and Charlotte Perriand, who spent time in Japan. Furthermore, the influence of the Bauhaus was felt through the attendance in Germany of a small number of Japanese architects such as Kikuji Ishimoto and Iwao Yamawaki in the 1920s and 1930s. The latter's design for his own living room in Tokyo in the 1930s revealed close visual affinities with European Modernist counterparts with its exploration of space and light, undecorated surfaces complemented by the insubstantial forms of cantilevered metal chairs. Other architects such as Kunio Maekawa and Junzō Sakakura worked with Le Corbusier, the former translating Le Corbusier's *L'Art Décoratif d'aujourd'hui* (1925) in 1930. Furthermore, in 1929 a wider international orientation was acknowledged through the foundation of the Japan International Architectural Association (Kokusai Kenchiku Kai). However, Modern Movement interior design and architecture in Japan did not share the social agenda that underlay the more radical work of mid 1920s Germany and in terms of domestic design, rather as in France, Britain, the USA and elsewhere, was largely the preserve of the well-to-do.

Until comparatively recently the Modernist aesthetic, stripped bare of superfluous decoration, has generally dominated the kind of industrial design displayed in many museums, themselves powerful conditioning agencies in the establishment of cultural hierarchies. Like many organisations promoting the cause of Modernism, such as the Deutscher Werkbund in Germany or the Council of Industrial Design in Britain, such museums have been bound up historically with notions of "improving" levels of taste. They have expressed their canon through published writings, exhibitions and collecting policies which have tended to celebrate individuals and pedestalise particular design icons as epitomes of cultural and artistic significance.

The Museum of Modern Art (MOMA), New York, established in 1929, has often been associated with the promotion of the Modernist aesthetic in architecture and design. In 1932 Philip Johnson and Henry-Russell Hitchcock organised the

Modern Architecture International Exhibition giving wider exposure to the term “International Style” coined for the title of their book. The exhibition included work by leading Europeans – Gropius, Mies, Oud and Le Corbusier – as well as a number of American architects, including Richard Neutra, whose Lovell House boasted an interior which has been felt by many historians to be the best example of what has been termed Californian Modernism. The 1932 architecture show was followed by the 1934 “Machine Art” Exhibition, organised by Johnson, with its emphasis on clean, platonic forms, symbolically and materially attuned to new materials and modern mass-production technology. Later in the decade, shows devoted to the work of Aalto and the Bauhaus consolidated MOMA’s position as a propagandist for the modern aesthetic. Such didactic exhibitions were mounted over the next three decades and promoted Eurocentric Modernism at the expense of the unashamedly “commercial”, and thus supposedly morally tainted (in the eyes of the design reform establishment), popular styling which was in tune with the North American marketplace. This popularism reflected widespread social preoccupations with speed, technological progress and science fiction. The idea of designed-in obsolescence, so scorned by Loos in the quotation from “Ornament and Crime” discussed earlier, continued to be seen by most museums as an anathema. The MOMA policy of a commitment to the symbiosis of form and function at the expense of ornamental and decorative expression continued into the 1940s under the curatorship of Eliot Noyes and the Good Design shows of Edgar Kaufmann, Jr. in the 1950s. Indeed Kaufmann was so anxious to stop what he saw as the American “disease” of designed-in obsolescence that he published an article in Britain in August 1948, warning of the dangers of “Borax; or, The Chromium-Plated Calf” – that is, the mass-appeal of the styling of many American automobiles, domestic appliances or other such products. This warning was something which the British Design Council certainly heeded in its Good Design Award scheme instituted in 1957, as did other organisations elsewhere in Europe such as La Rinascente’s Compasso D’Oro scheme in Italy or the French Ministry of Commerce’s Beauté-France Award – the award-winners generally reflected a commitment to a fairly refined Modernist canon.

Another closely allied prop of the Modernist status quo was the multinational corporation which emerged as a significant global force in the years following World War II. As part of their visible presence (their business ethos) in the public arena, such organisations adopted a clean, Modernist aesthetic, imbued with connotations of efficiency and rationalism, rather than an aesthetic which might be seen to hint at unseemly indulgence in ornamentation or intrusive decorative motifs, characteristics which might be identified with individuality, and thus fallibility, or even the simple out-of-datedness of ephemeral styling. Such a commitment to an international aesthetic, rather than one readily identifiable with more sectarian national interests, was important in the quest for worldwide market penetration. Such ideas were at the root of the international design conferences held at Aspen, Colorado which were launched in 1951.

Companies such as Olivetti in Italy, Philips in the Netherlands, IBM, Herman Miller and Knoll in the USA and

Hille in Britain, all of whom were involved in the development of the modern international interior of the post-war years, also readily spring to mind in connection with the globalisation of Good Design. It is no surprise to see their cultural status reinforced in the collections of the Design Museum, London, the CCI Permanent Collection, Paris, the Boymans-van Beuningen Museum, Rotterdam and elsewhere. The wheel comes full circle in the patronage by large multinational corporations of design exhibitions featuring their own products.

However, despite the adoption of the Modernist interior by multinational corporations, museums, state organisations and others in the post-World War II period, there were other culturally powerful forces afoot which sought to undermine the Modernist status quo. Increasing sociological, cultural and literary attention was being paid to the nature and impact of mass culture. Critics and writers such as Roland Barthes, Umberto Eco and Robert Venturi articulated the view that the Modernist canon had impoverished the semiotic possibilities of architecture and design. The 1950s and 1960s bore increasing witness to the immense impact of the mass media which were able to deliver images and cultures from all over the globe at an ever-increasing pace. The widespread availability to designers and consumers of such a variety of imagery and values opened up the possibilities of utilising a far richer syntax in the styling of designed products. Rapid changes in electronic technology also gave the lie to the adage “form follows function” as the increasing miniaturisation of electronic components meant that designers were freed from the tyranny of the black box and could evolve forms and details, layered with meaning and intelligibility, in configurations that sought to convey a range of meanings. Key texts which gave theoretical validation to such thinking included Robert Venturi’s *Complexity and Contradiction in Architecture* (1966) and Charles Jencks’s *The Language of Post-Modern Architecture* (1977).

In Italy parallel debates were extremely lively and gave rise to a feeling among the avant-garde that style and status were endowed with greater importance than genuine creativity, and that individual creative energies were being deadened by the overriding dictates of manufacturers, industry and their markets. The experimentation of groups such as Archizoom Associati with their “dream bed” series of interiors from 1967, which drew upon a wide range of eclectic references and kitsch for their meaning and impact, marked the death knell of Modernism in Italian design as a force with any pretensions to radicalism.

Mollino, Carlo 1905–1973

Italian architect, designer and photographer

Architect, writer, photographer, aviator, downhill skier, racing car driver and, last but not least, furniture designer, Carlo Mollino was one of the most colourful and creative figures on the Italian design scene during the early post-war years, and a key figure in the Italian design renaissance which took place during the late 1940s and early 1950s. Through his imaginative and outrageous furniture, a note of fantasy was injected into mainstream “Contemporary” design, and his work serves as a reminder that, in addition to organic abstraction, the other dominant movement in the art world immediately prior to World War II was Surrealism. Mollino’s aesthetic clearly emerged from a cocktail of these two artistic influences.

Up until World War II the Dalíesque forces were in the ascendant, as witnessed by the subversive decadence of Mollino’s designs for the interior of the Casa Devalle in Turin in 1939–40, with its mirrored walls, its Surrealist architectural flourishes, and in particular its ultra-opulent bedroom complete with padded ceiling, fabric-draped walls and plushly upholstered pastiche-19th-century buttoned velvet seat furniture. However, four years later when Mollino designed the interior of the Casa Minola in Turin, his work had developed new characteristics more typical of the visual idiom of the post-war “Contemporary” style. His furniture had become more overtly anthropomorphic and at the same time more playful. The growing influence of abstract organic sculpture was also apparent, especially in the contours of his upholstered furniture. After the war Mollino’s work became increasingly original and dynamic, and his work of the late 1940s in particular can be seen as a celebration of the liberation of the human spirit and the freeing of the imagination at the end of the war.

Mollino was by nature a highly theatrical designer; he might aptly be described as the Philippe Starck of his day. There was a showy, larger-than-life, Hollywood quality to his work, which made it ideal for upmarket glamorous commercial inte-

riors such as ballrooms and theatres. Being somewhat impractical to use and expensive to produce, however, his furniture was less well-suited to conventional domestic interiors, and as a result was mainly produced in response to one-off private commissions such as the Casa Orenco of 1949. In some respects Mollino’s approach to design was similar to the great French *decoreurs* of the 1920s and 1930s, a continuation of the ethos of Parisian Art Deco. To use an analogy from the fashion industry, whereas a designer such as Gio Ponti, through his partnership with the furniture manufacturer, Cassina, was content to design “pret-a-porter”, Mollino produced the equivalent of haute couture and catered exclusively to the luxury market.

During the second half of the 1940s, when Mollino’s work first began to attract public attention, it was seen as a part of a new trend in post-war Italian design known as neo-Liberty, so-called because it superficially resembled some aspects of the Art Nouveau style popular around the turn of the 19th century. In Italy Art Nouveau had been known as Stile Liberty because of its association with the London department store, Liberty’s. However, although Mollino’s work shared with the original Stile Liberty an interest in naturalism and curvilinear flourishes, his designs were by no means a pastiche of Art Nouveau. There were similarities from the point of view of rhythm, energy and freedom of expression, but Mollino’s designs were much more abstract. In his *Arabesque* table of 1950, for example, the dramatic whiplash motif familiar from Art Nouveau is used in a much more abstract way, and forms an essential part of the structure of the table rather than being simply an element of surface decoration. Serial-produced by Apelli and Varesio, this small glass-topped oval side table, supported by an open framework of bent laminated wood cut from a single sheet, is one Mollino’s best-known and most successful designs.

Although Mollino’s work has clearly identifiable Italian characteristics, it was at the same time highly individual and personal. There was a strong element of make-believe in his designs. His most expressive and suggestive chairs represent the indulgence of a private sexual fantasy. As a designer and as a photographer Mollino was obsessed by anatomy, particularly the curvilinear form of the female body, which he frequently used as the source of inspiration for both the shape and the structure of his chairs. The overtly biological quality of his chairs is also evident in the sensuous way they were intended to interact with the sitter. In the most extreme cases the act of sitting took on the suggestion of coupling. Anatomical themes were also explored in Mollino’s glass-topped dining tables, the complex exposed vertebral supports of which resembled the human spine. The frames of these tables, which were usually made of laminated wood, were cut and bent into an interlocking arrangement reminiscent of bones. Considered purely from a manufacturing point of view, Mollino’s furniture represents a dazzling tour de force of technical bravado, and it was fortunate for him that he worked in a country with such a strong workshop-based furniture industry, with the skills and the flexibility to translate his artistic fantasies into reality.

Always dynamic and full of movement, Mollino’s furniture demanded an active rather than a passive response from the user. It was not intended to blend into the background and it certainly could not be ignored. Some of his most energetic

Mollino: installation at the *Italy at Work* exhibition, Brooklyn Museum, 1950-51

creations had strong animal qualities: they resembled creatures that were about to pounce or scuttle out of the room. Others, such as his desk designs, were more straightforwardly aerodynamic with structures apparently inspired by aeroplane components. A typical Mollino desk had an open framework, a biomorphic top, splayed tapering legs and a suspended drawer unit. The result was a piece of furniture that was light and sprightly, resembling a bird coming into land. It was this aspect of Mollino's style – its aerodynamic quality – which was to have the strongest influence on other designers working in Italy at the time, and which adds a element of surprise into Italian “Contemporary” design.

LESLEY JACKSON

Biography

Born in Turin, 6 May 1905, the son of an engineer, Enrico Mollino. Studied engineering, and then architecture at the University of Turin, 1927–31. Worked as an architectural designer in his father's office, Turin, 1928–31; freelance architect from 1931; exhibition and furniture designer from 1935; car and aeronautical designer from 1954. Professor, Accademia di San Luca, Turin, and Politecnico of Turin. Published several books on art and design during the 1940s and 1950s. Exhibited at several international exhibitions including the Milan Triennale exhibitions 1954 and 1957. Died in Turin, 1973.

Selected Works

Interiors

- 1939–40 Casa Devalle, Turin (interiors)
- 1941 San Giuseppe College, Turin (furniture)
- 1944 Casa Minola, Turin (interiors)
- 1945 Apelli & Varesio, Turin (offices and interiors)
- 1947 Casa de Sole, Cervinia (interiors)
- 1949 Casa Oregno
- 1950 House in San Remo (interiors)
- 1970 Teatro Regio, Turin (furnishings and interiors)

Furniture produced by Apelli & Varesio, Turin; patented articulated lamps with Birri; designed prize-winning range of cutlery for Reed and Barton, 1960.

Morning Rooms

Morning rooms, with a distinct function and a particular style of decoration have a relatively short history, dating from the early 19th to the early 20th century, and they seem to have been an English invention with some examples in North America where English influence was felt. Their history also overlapped somewhat with the use and decoration of breakfast rooms, although the two were not synonymous.

The emergence of the distinct character of the morning room was initially the result of changes in the disposal of other rooms in the house. The removal of bedrooms from the ground floor to the upper storeys and the decreasing use of boudoirs meant that, by the early 19th century, there was a need for an additional daytime sitting room for women. This room was fairly private, a female equivalent of the masculine study; it was decorated in a manner that reflected generally accepted notions of feminine styles and which were distinguished from the styles used in the more formal drawing room. The inclusion of such a room in wealthier homes is made clear in *Emma*, published in 1816, where Jane Austen refers to a morning room that is particularly liked by the woman of the house.

The need for morning rooms was not felt on the Continent where the use of boudoirs and bedrooms as sitting rooms in the daytime continued throughout the 19th century. Also the segregation of women was far less pronounced than in England.

The lighter style of decoration favoured for morning rooms might have been influenced by the trend in later 18th century breakfast rooms, an example being Sir John Soane's home at 12 Lincoln's Inn Fields. A painting of this room by Gandy, c.1798, shows it to have a domed ceiling which is decorated with painted trellis and flowers. In 1833 J.C. Loudon recommended, for both breakfast and morning rooms, an east or south-east aspect to catch the morning sun. In keeping with this aspect, he also suggested light colours for the decoration, and wallpaper and curtains with trellis, flowers and foliage in naturalistic designs. The log-books of the decorators Cowtan and Sons (Victoria and Albert Museum) covering the period 1824–50 contain numerous samples of patterns of this kind that were intended for morning rooms. And Mary Ellen Best's watercolour of herself in her painting room at her home in York (c.1840), shows a room with just this style of decoration; the light-coloured wallpaper and curtains have a matching pattern of naturalistic flowers and leaves and the furniture is of pale, unpolished wood (Davidson, 1985). This style was not only well-suited to a room designated for daytime use but it also contrasted with the more formal drawing room which had darker, richer colours, polished mahogany or rosewood furniture and a greater abundance of upholstery.

During the 1830s and 1840s wallpaper and printed cottons were becoming cheaper and more widely available and as a

result it was possible to create very different styles of decoration without expending vast sums of money. The morning room would not have been as expensive to set up as the drawing room and dining room, the important public rooms of the house, but it was nevertheless a more stylish room than the parlour which was a general-purpose third living room.

The principal distinction between breakfast and morning rooms during this period was that, in larger houses, a morning room would not have been used for meals. In smaller, middle-class homes, however, morning rooms often functioned both as a daytime sitting room for women and as a room where the whole family might have informal meals. The class difference also meant that whereas middle-class morning rooms were less well furnished than drawing rooms, in larger houses they were elegant and often fashionable rooms that could be used for guests.

By the second half of the 19th century there was growing emphasis upon the specialisation of rooms and an increasing tendency to separate male and female areas within the home. Within this context, the morning room was designated as a feminine space and in 1864 Robert Kerr, writing in *The Gentleman's House*, stressed the need for morning rooms as an all-female preserve. By this time too, morning rooms and breakfast rooms were common in most country houses, but the fact that they were hardly ever both present in the same house is another indication of the overlapping nature of these rooms (Franklin, 1981).

A change occurred in the use and decoration of morning rooms in the later 19th century. Although feminine styles of decoration were retained in some houses, in others a heavier decorative treatment was adopted, particularly if the morning room doubled as a study, a room with more masculine overtones. Thus the morning room at 18 Stafford Terrace, the home of the *Punch* cartoonist, Linley Sambourne, contained delicate 18th-century furnishings and an assortment of occasional tables and desks as befitted a room used by Sambourne's wife and daughter, but a similar room in the house owned by the wealthy banker, A. A. Ionides, in Holland Park, was decorated by Morris & Co. in a much more masculine style. In the last decades of the 19th century the male appropriation of morning rooms is confirmed by London clubs including morning rooms for their all-male clientele.

The need for rooms with specific roles and for segregation of the sexes fell from favour in early 20th century. And the term morning room survived for a time only in clubs and hotels as a reminder perhaps of an earlier, more leisurely lifestyle.

Morris & Co.

British interior decorators and manufacturers of furniture, wallpapers, textiles, tiles, metalwork and stained glass, 1861-1940

Morris & Co. is today the most widely known name in the field of 19th century interior decoration. For most of its early life the company was under the control of William Morris (1834-96) whose personality and beliefs so stamped its activities that the firm and the man are often treated synonymously. His fame as a poet, prose writer, illustrator, calligrapher and printer and his reputation in building conservation and socialist politics contributed to the public recognition and success of Morris & Co. By the time of his death, Morris was widely credited with the responsibility for revolutionising popular tastes and practices in interior decoration. He was a master of flat pattern, and the firm's textiles, wallpapers, tapestries, embroideries and carpets have a recognisable and characteristic appearance; their profuse, organic, rhythmic, highly conventionalised foliage and floral forms stimulated a surge of original design in Britain and America in the late 19th century as well as a generation of derivative copies. Later, the influence can be traced in the development of European Art Nouveau and its offspring.

Ideology, too, was important. Morris abhorred the effect industrialisation had on the health, happiness and surroundings of the workers, and he disliked most of its products. He held, at least for a while, an idealised vision of a craftsman taking pleasure in producing decent work from decent materials, using appropriate forms and decoration. In fact, by no means all Morris & Co. products were hand-made or made by their designer – costs and competition saw to that – and in the end Morris put his faith more in political change than reform through art. Nevertheless, his work was an inspiration to the Arts and Crafts movement.

Morris, Marshall, Faulkner & Co. (the original title of the business) was established in 1861 by the three eponymous partners and four others: D.G. Rossetti and Ford Madox Brown, already well-known painters; Philip Webb, a young architect with Gothic vernacular leanings; and Edward Burne-Jones, Morris's particular friend and a soon-to-be-famous painter. According to its first catalogue the firm offered:

- i. Mural decoration, either in Pictures or in Pattern work, or merely in the arrangement of colours, as applied to dwelling houses, churches, or public buildings.
- ii. Carving generally, as applied to Architecture.

Morris & Co.: drawing room, Kelmscott House, Hammersmith, 1890s, showing *Bird* tapestry, adjustable armchair and settle

- iii. Stained Glass, especially with reference to its harmony with Mural decoration.
- iv. Metal work in all its branches, including jewellery.
- v. Furniture, either depending for its beauty on its own design, on the application of materials hitherto overlooked or on its conjunction with Figure and Pattern Painting. Under this head is included Embroidery of all kinds, Stamped Leather, and ornamental work in other materials, besides every article necessary for domestic use.

A showroom and workshops were set up in Red Lion Square, London, moving in 1865 to larger premises at 65 Queen Square. The partners, according to their abilities and expertise, contributed designs which were generally made up on the premises by themselves, their friends and relatives or by a small staff of workmen. Stylistically, much of the early output reflected a romantic medievalism. The furniture included massive carpentered pieces such as the *St. George's* cabinet of 1861 (now in the Victoria and Albert Museum), designed by Webb and decorated with narrative scenes by Morris. Motifs taken directly from hangings illustrated in a

late 15th century version of Froissart's *Chronicles* can be seen in painted tiles, stained glass quarries and in the *Daisy* wallpaper of 1864. The firm's entries in the 1862 International Exhibition won two commendations amidst suggestions from competitors that the glass was merely touched-up examples of genuinely old pieces.

Although early products included domestic items such as jewellery and table glass (largely designed by Webb), a boom in Gothic Revival church building created a demand for appropriate murals, woodwork, furniture, hangings and stained glass. Rossetti's architectural contacts, particularly with G.F. Bodley, led to important orders in the early 1860s: *St. Martin's* in Scarborough, *St. Michael and All Angels* in Brighton and *All Saints*, Selsley, Gloucestershire, for example. Rossetti, Madox Brown and Burne-Jones were the main providers of important stained-glass cartoons at this period, with Morris bearing overall responsibility for carrying out commissions.

But there were also domestic and secular interiors. Two particularly important public commissions were for the Green Dining Room at the South Kensington Museum (now the Victoria and Albert Museum, where the scheme still exists) and

the Tapestry and Armoury Rooms at St. James's Palace, both undertaken in 1866–67 under Webb's general supervision. Both used repeating painted decoration on the walls, wainscot and ceilings, but South Kensington is perhaps the more characteristic: the wainscot dado is painted green, inset at the top with panels of oil-painted decoration, either medieval figures by Burne-Jones or sprays of branches, blossoms and fruit on glowing gold grounds. The wall bears a painted relief design of olive branches on a soft green ground, topped with a frieze in green, red and gold, including panels of running dogs and hares. The stained glass was designed by Webb and Burne-Jones.

Later commissions, particularly those for rich clients where no expense was spared in producing gorgeous and unusual results, gained considerable publicity in the art press. Between 1880 and 1888, the firm undertook a great deal of decoration at 1 Holland Park, a house belonging to Alecco Ionides, businessman, patron of the arts and, from 1884, Greek Consul General. The public apartments, in particular, presented a glowing depth of opulence. The Antiquities Room was typical in achieving its effects using a mixture of newly designed and standard items: the walls were hung with the embossed *Chrysanthemum* paper, specially silvered and laquered; the ceiling was painted in a gold and silver pattern; the over-mantel was devised by Walter Crane to display the owner's collection of Tanagra statuettes; the Morris & Co. carpet was hand-woven for the room (though to an existing design); while the woven silk hangings came from the stock range.

At St. James's Palace, between 1880 and 1882, the firm was engaged in large-scale redecoration of the State Apartments and entrances. The approach here was grand, though less idiosyncratic. Much use was made of a specially designed wallpaper and silk damask (both were called *St. James's* though they were not of the same pattern). The smaller rooms used stock items in a more domestic manner.

A particularly extravagant commission was undertaken between 1888 and 1896 at Stanmore Hall in Middlesex, owned by William Knox D'Arcy, an Australian mining magnate. Many new designs were specially made, including the very fine set of *Holy Grail* tapestries for the dining room. Photographs of the interiors show a mass of pattern and detail. Much of this project was in the hands of J.H. Dearle who had joined the company in 1878 as an assistant, eventually rising to become a designer, manager of the firm's production and, after Morris's death, artistic director.

But prestigious and lucrative though such schemes were, it was the expansion of the firm's activities as a retailer and manufacturer that was ultimately responsible for the widespread dissemination of a coherent and recognisable house style. Morris & Co. provided a full range of stock items that could appeal as much to the reasonably affluent as to a rich or artistic coterie. However, neither the style nor the range was achieved immediately. In wallpapers, for example, the first three (*Daisy*, *Trellis*, and *Fruit*), issued between 1864 and 1866 employed simple repeats of groups of flowers or foliage sprays. They were followed before 1870 by a group of four designs closely based on 18th-century examples. But thereafter there was a steady supply of original patterns demonstrating the firm's mature manner. Printed textiles had a similarly bumpy start, but from about 1875 onwards were produced with

increasing confidence. (For a full description of the extent and evolution of Morris's work in this field see Peter Froud, "Dating Morris Patterns", *Architectural Review*, 126, July 1959, 14–20.) Piece-dyed serges and Utrecht velvets were on offer by the mid 1870s, at which point woven textiles such as damasks, double-cloths and muslins in the company's own designs were introduced. Two linoleums and a number of machine-made carpets, made by outside manufacturers to Morris & Co. specifications, were added at much the same time, followed in 1878 by the very high quality hand-knotted (*Hammersmith*) rugs and carpets. Also individual and expensive were the tapestries of 1881 onwards. Like the carpets, they could be made to commission or produced to existing patterns. Designed mostly by Burne-Jones and Morris, they were almost always figurative and narrative in content.

The firm's furniture had from the beginning included simpler items alongside the individually decorated pieces. One of the most successful "lines" was that of Sussex rush-seated chairs, based on traditional country models, some of which sold for only a few shillings. At the other extreme was the grand piano, designed by Burne-Jones and W.A.S. Benson and decorated in gold and silver gesso by Kate Faulkner, in the drawing room at 1 Holland Park. Similarly, embroideries ran the gamut from commissioned designs, worked either by the company or by the client, through to small items such as bell pulls, ready-made and in kit form. (From 1885, Morris's daughter, May, was responsible for the firm's embroidery department.)

The distinctive, soft yet strong, colouring of Morris & Co. textile goods was an important element in their success. It was achieved by the use of old-fashioned natural dyes and traditional processes that had been almost completely superseded during the previous half century. It was only with extraordinary persistence and experimentation that Morris was able to recover the techniques that gave him his desired effects. The acquisition in 1882 of a factory at Merton in Surrey allowed the perfection and standardisation of these methods. There was also, at last, adequate space for the in-house production of the high quality hand-made goods that were the company's hallmark. Printed and woven fabrics, knotted carpets, tapestries and stained glass were henceforth all made at Merton. Items such as wallpaper and machine-made carpeting were left with outside manufacturers who were able to provide the required quality.

The development of the firm in this direction was largely due to Morris himself, and in 1875 the business was reconstituted as Morris & Co. under his sole ownership and direction. Of the original partners, only Burne-Jones and Webb continued to produce new work, the former for tapestries and stained glass, the latter for furniture and tapestries. Morris was, until his death, responsible for the great majority of the designs involving flat pattern. Those produced by colleagues such as Kate Faulkner, May Morris and J.H. Dearle are usually so close to his own style that certain attribution can be difficult. Others involved included George Jack who took over from Webb as the chief furniture designer in about 1890. Tiles and pottery, conceived and made by William De Morgan, and the metalwork and light fittings of Benson, were sold extensively from the 1880s.

The opening, in 1877, of a new showroom and shop in fash-

ionable Oxford Street, allowed the coherent and attractive display of the range to a wider clientele. The presentation of a complete “look” in one showroom was a new and very successful concept, attracting particularly a “niche” market of artistic or advanced intellectuals. Customers could see how to put the style together and could take it as far as pocket and taste allowed. The main tenet of the “Morris” style of decorating was a light and functional simplicity – “Have nothing in your houses that you do not know to be useful, or believe to be beautiful” – which contrasted with the more usual “clutter” of the late Victorian period. This can be seen to perfection in Morris’s own rooms, but there are many examples which show that the firm’s products were also used more conventionally.

Press coverage and participation in exhibitions helped to spread the Morris name, both in Britain and abroad. A large and successful stand at the Boston Foreign Fair in 1883, for example, reinforced the work of the East Coast agents who had been representing the firm since 1878. Interiors using the company’s goods are known as far afield as Australia and Sweden. Nearer to home, a shop, showroom, decorating service and workshops were set up in Manchester in the early 1880s.

Morris never approved of fashion, believing instead in the lasting value of beautiful objects. Thus, an item, once in the range, generally remained, resulting in a relatively small but coherent collection which continued as the core of the company’s output even after Morris’s death in 1896. Initially the firm was left in the hands of the Smith brothers (who had managed the showroom) and J.H. Dearle. New patterns, such as the *Bourne* printed cotton, c.1905, followed the established house theme, but from about 1905, when the firm was reconstituted as Morris & Co., Decorators Ltd., with a board of eight directors, there were increasing moves towards the revival styles that were generally fashionable. This policy proved sufficiently successful to allow the showroom to move in 1917 to grander premises at George Street, just off Hanover Square, but without Morris’s informing vision and control there was an inevitable decline in vigour. Moreover, much as Morris might have hated the idea, his company’s products had been extremely fashionable in the later 19th century and they came to suffer the usual fate of becoming passé. The firm struggled on until 1940, when it was dismantled. One department survived the process; Sanderson, which had been printing the wallpapers since 1927, acquired that part of the business and continues actively to use the patterns, both as papers hand-printed by the original methods and as adaptations.

Selected Collections

A large collection of furnishings and decorative work, designs and documentation, relating to Morris and Morris & Co. is in the William Morris Gallery, Walthamstow, which is located in Morris’s boyhood home. Important and substantial additional collections, representing different aspects of the firm’s work, in Britain are in the Birmingham Museum and Art Gallery; the Fitzwilliam Museum, Cambridge; the Victoria and Albert Museum, London; the Whitworth Art Gallery, Manchester; and the Ashmolean Museum, Oxford. The Cooper-Hewitt Museum and the Metropolitan Museum of Art, New York, also hold examples of the firm’s work. Examples

of Morris & Co. furnishings, textiles and decoration survive *in situ* at the Red House, Bexleyheath; Kelmscott Manor, Oxfordshire; Standen, near East Grinstead; and Wightwick Manor, near Wolverhampton. A list of public collections appears in Parry 1983.

Interiors

- 1860 Red House, Bexleyheath, Kent (furniture, decoration and textiles; building by Philip Webb): William Morris
- 1862 Medieval Court, International Exhibition, London (display of furniture, textiles, and stained glass)
- 1862 Harden Grange, West Yorkshire (stained glass): Walter Dunlop
- 1866–67 South Kensington Museum (Victoria and Albert Museum), London (decoration of the Green Dining Room)
- 1866–67 St. James’s Palace, London (decoration of the Armoury and Tapestry Rooms; Blue and 1880–82 Room and Throne Room 1880–82)
- 1872–82 1 Palace Green, London (textiles, furniture, painted decoration and Burne-Jones’s *Cupid and Psyche* frieze): George Howard
- late 1870s Rounton Grange, Northallerton, Yorkshire (carpets, woven hangings, furniture and embroidered frieze for the dining room; building by Philip Webb): Sir Isaac Lowthian Bell
- 1880–88 1 Holland Park, London (tapestries, textiles, carpets, embroideries, painted decoration and wallpapers): Aleco Ionides
- 1881 Old Swan House, Chelsea (textiles, carpets, furniture and painted decoration): Wickham Flower M.P.
- late 1880s Great Tangley Manor, Tangley, Surrey (textiles, carpets and furniture): Wickham Flower M.P.
- 1888–96 Stanmore Hall, Middlesex (textiles, carpets, furniture, painted decoration and tapestries): William Knox D’Arcy
- before 1889 Clouds, Salisbury, Wiltshire (textiles, carpets, furniture and tapestry; building by Philip Webb): Hon. Percy Wyndham
- late 1880s–early 1890s Wightwick Manor, Wolverhampton, West Midlands (textiles, woven hangings and furniture): Theodore Mander
- 1889–early 1890s Bullerswood, Chislehurst, Kent (textiles, carpets, tapestry and painted decoration): Sanderson family
- mid-1890s Standen, near East Grinstead, Sussex (wallpapers, textiles, embroideries, carpets, furniture; building by Philip Webb): James Beale

Morris & Co. produced furniture from 1862; much was designed by Philip Webb (1831–1915), Ford Madox Brown (1821–93) and George Jack (1855–1932). Stained glass was designed by D.G. Rossetti (1828–82), Edward Burne-Jones (1833–98), Webb, Brown and Morris himself from 1862. The first wallpapers were issued in 1864, the majority designed by Morris, and later John Henry Dearle (1860–1932) and Kate Faulkner (d.1898). Embroideries, principally designed by Morris and Burne-Jones, appeared from 1862; printed textiles from c.1868; woven textiles from c.1875; carpets from 1875; and tapestries from 1877. The firm also supplied tiles from 1862 (from 1875 the production of these was taken over by William De Morgan (1839–1917), glass and tableware by Webb, and painted decoration often supervised by Webb and Morris.

Further Reading

The literature on William Morris and the designers associated with Morris & Co. is vast. Two excellent and detailed book-length bibliographies are Aho 1985 and Latham 1991. The *Journal of the William Morris Society* also publishes a Morris bibliography, updated biennially. The standard biographies of Morris are Mackail 1899 and MacCarthy 1994; the most complete collections of Morris’s writings and letters are May Morris 1910–15 and William Morris 1984–87. For useful studies of the firm’s designs see Myers 1982 (tiles), Parry 1983 (textiles), Parry 1996 (furniture, textiles, wallpapers, decoration

and stained glass), Sewter 1974–75 (stained glass), and Watkinson 1967 (general). Parry also includes a section on Morris & Co.'s principal interior design commissions and reproduces many contemporary photographs of the firm's interiors.

Mosaic

The first mosaics were composed of pebbles or fragments of rock, shell or bone, a direct, inexpensive method which still thrives in folk building. Assyrian palaces of the 9th century BC had simple floors of black and white stones laid in concentric circles, but four centuries later Greek artists were fully exploiting the palette of natural stone. The pebble floors of Olynthos

and Pella are among the finest, with heroic motifs from mythology and the hunt set in designs – circles inside squares, with meander, key or wave borders – that suggest carpet. The Olynthian floors are earlier, and employ large smooth stones in muted hues; at Pella tiny, brightly colored pebbles were articulated with thin strips of lead. As these were laid in private homes, they probably represent the late flowering of a long tradition.

Sumerian mosaicists used moulded colored clay pegs and geometric shapes cut from shell and stone, but pre-formed tesserae were not used again until the 4th century BC, in Greece. Roughly chiseled stone tesserae made flat, even floors, their color enhanced by polishing; any stone could be cut, greatly expanding the mosaicist's palette. By the 2nd century BC, finely cut tesserae were a standard material, combined with terracotta fragments or cut glass *smalti* for hues unavailable in stone. In the Hellenistic palaces of Pergamon, artists used tiny tesserae in subtle color gradations to create witty, illusionistic mosaic floors whose detail and modelling rival painting. The famous and widely copied *Unswept Floor* attributed to the artist Sosos was littered with realistic table scraps – grape stems, shrimp tails, chicken legs – each with a neatly outlined shadow. Most mosaics of this quality were made by specialist workshops and set within borders of coarser stones. Their subjects were both heroic and domestic, from battle scenes and mythological narratives to baskets of asparagus, braces of ducks and wily cats devouring birds. Few exploited their position on the floor, being composed, like paintings, for a single vantage point. Mosaic watch-dogs or lions, however, often stood guard near a doorway. On the floors of many Roman dining rooms, figurative panels were oriented to be seen when entering the room or reclining during the meal; areas of plain white or simple patterns bordered the dining couches.

The Romans laid mosaic floors throughout their empire; in Britain and North Africa such pavements seem to have practically defined status among the Romanized gentry. Mythological or heroic subjects were favored for Imperial buildings and large villas, and many mosaics recorded the circuses, dramas and staged hunts of the Roman amphitheatres. These subjects might be mirrored in the ceiling design, while the structure of vaults could be echoed on the floor. Floor mosaic generally followed an architectural logic, but illusionistic devices were also popular: geometric borders often read equally well in perspective or as flat pattern, and the medallions below domed vaults pulsed with a peculiar optical depth.

In response to the demand for mosaic, Roman workshops devised less expensive solutions. Starkly stylized figural mosaics in black and white were much cheaper than naturalistic inserts, and remained fashionable in Italy until the 3rd century. Geometric designs were used for carpet-like all-over patterns as well as borders. Many floors were plainer: fields of black or white tesserae, punctuated with irregular fragments of colored stone and simply bordered, achieved a charming informal effect. Very grand walls and ceilings were decorated entirely with mosaic, but in most buildings it was confined to vaults, columns, or niches. Glass *smalti* were set into the walls at varying angles, creating a glittery play of light which must have been dazzling in lamp-lit interiors. In many Pompeian villas mosaic wall niches were placed within the front doorway

Mosaic: Italian design for mosaic floor, 1779

where visitors would be sure to see them. Mosaic was also a practical solution for damp bath-houses, which were appropriately embellished with romping dolphins, fishes, and aquatic plants. Occasionally whole shells were incorporated; these later inspired the fantastic shell-mosaic grottoes of the 17th century.

The floors and walls of wealthy Byzantine homes were decorated with mosaic, yet most surviving domestic examples are closely related to the Roman tradition. Even so, mosaic was never common in medieval European interiors. In 427 the Codex Theodosianus outlawed the use of Christian symbols on floors, where they might be sullied by congregants' feet, and mosaic floors in late medieval churches still drew heavily on classical ornament – purged, of course, of blatantly pagan imagery. Early church walls, however, glowed with intensely colored, reflective glass mosaic, and by the 5th century the Romans' fields of white tesserae had been replaced by glittering gold backgrounds. This style of mosaic decoration dominated ecclesiastical art well into the 15th century, and its influence, if not its imagery, extended to the Arab countries, where many Islamic sanctuaries and palaces were encrusted with glass mosaic in non-figural patterns. The decoration of the Norman Palazzo Reale in Sicily is a fascinating hybrid of East and West, setting Christian saints and Islamic-style trees, lions and peacocks against a brilliant gold background. During the 12th century Islamic artists began producing small, geometric earthenware tiles, glazed with clear turquoise, cobalt-blue, yellow, green and white. This purely ornamental mosaic spread throughout the Islamic world, and remained in use into the 17th century. In Egypt and Syria similar designs were made with cut marble tiles, using a technique closely related to the complex, geometric "Cosmatesque" mosaics of medieval Italy and England.

In 1576 the Vatican mosaic workshops began redecorating St. Peter's with "eternal pictures", sparking a fashion for

portable glass mosaics. Most were copies of paintings, and mosaicists took pride in the tiny tesserae and finely graded colors used to imitate oil and fresco. By 1810, mosaic tabletops were available in Rome, and landscapes and copies of famous antique mosaics were popular for both tabletops and independent pictures. The English ceramics industry offered porcelain tesserae by 1840, and these were sold in sheet units with classical motifs and borders as early as 1870. Primarily black and white, these "mosaic" tiles were ubiquitous in halls and bath-rooms until the 1930s – so much so that on the open floors of Best Products, Inc.'s Postmodern Virginia headquarters (1979), a circulation path of similar tiles plainly suggested an Edwardian hallway.

Among the few Neo-Classical interiors which used real mosaic, the "Etruscan Room" at the Castello Reale di Racconigi outside Turin (1834) had a floor decorated with marine motifs in blue and gold tesserae. Later Beaux-Arts classicism inspired the use of mosaic in public buildings, but only the wealthiest Victorians commissioned it for their homes. Lord Leighton's Arab Hall in London sported a mosaic frieze designed by Walter Crane (1879) who was also designed mosaic panels for the drawing room of Stewart Hodgson's house in South Audley Street. William Burges set a "Gothic" mosaic panel over the Arab Room fireplace in Cardiff Castle (1878–81), and McKim, Mead and White designed mosaics for the vaulted ceiling for Villard House in New York (1882–86). Each of these examples juxtaposed High Renaissance ornament with Byzantine-style polychromy and gold. The elaborate mosaic ceiling in Sir Ernest Debenham's London Arts and Crafts home (1906–07) was installed against his architect's better judgment; in contrast, Charles Rennie Mackintosh's subtle fireplace surround for Hill House (1902) was beautifully suited to the finicky clarity of his rooms. Surprisingly, Antoni Gaudí – the acknowledged master of modern mosaic – used almost none in his interiors.

Boris Anrep's exuberant mosaic designs for avant-garde English interiors of the 1920s anticipated the playful 1950s taste for cheery, stylized patterns in small ceramic tiles for stairways, floors, fireplaces, bar counters and wall murals. Prominent artists like Hans Hoffmann and Marc Chagall designed mosaic murals for stark modern buildings, inspiring legions of hobbyists to cover their tables, lamps and picture frames with mass-produced tesserae in the 1950s and 1960s. But by the mid-1970s this style had lost its appeal, and mosaic still awaits its next revival.

Moser, Koloman 1868–1918

Austrian painter and designer of interiors and furnishings

Together with Josef Hoffmann, J.M. Olbrich and Adolf Loos, Koloman Moser was one of the most influential designers of the Viennese Arts and Crafts Movement. Co-founder of the Wiener Werkstätte, he helped to develop the distinctive "Vienna Style", which became a synonym in the applied arts for clarity of design and geometry and stylization of decoration. He was active as a designer and teacher in all areas of the arts and crafts. And, in contrast to Hoffmann, whose work is characterized by the tectonic, Moser evolved a type of design that championed the decorative and painterly.

Moser was a student at the Vienna Academy of Fine Art's Special School of Painting under professors Franz Rumpler, Christian Griepenkerl and Josef Matthias Trenkwald (who also taught Gustav Klimt) from 1886. In 1892 he moved to the Vienna School of Arts and Crafts, thereby evincing his leaning towards a decorative form of painting, such as that taught at the School of Franz Matsch affiliated to the Austrian Museum of Art and Industry.

In 1897 he co-founded the Vienna Secession Organization of Fine Artists, which broke away from the Academy as a representative of the concerns of the younger generation of artists. Moser took part in the organization of exhibitions, played a decisive role in the graphics for the Secession's news sheet *Ver Sacrum* (which appeared from 1898 onwards), and worked closely with Olbrich on the architectural design of the Secession's new building on the Karlsplatz (1898). The *Owl Frieze* and the frieze of *Women Dancers* on the façades at the

sides of this building and the round glass window above the entrance are by Moser. Before his resignation, with the Klimt Group, in 1905, Moser organized four of the 23 Secession exhibitions on his own, eight together with Hoffmann, and took part in two further ones.

In 1899 Moser, along with Hoffmann and Alfred Roller, began to work as a teacher in the School of Applied Arts' department of decorative painting. He and his students carried out designs for craft objects in many different media for manufacturing firms such as the porcelain distributor Josef Böck (after 1898), the textile firm of Johann Backhausen (from 1899), the glass company Bakalovits (from 1899) and the furniture companies Portois & Fix (1900), J. & J. Kohn (1902–04) and Prag-Rudniker (1902–04). His two-dimensional pattern designs – wallpapers, furnishing fabrics, and floor coverings – gained wider circulation through their publication as patterns for interior decoration in portfolio works such as *The Source* (1901) and *The Surface* (1902).

In the early Secession exhibitions, Moser combined the presentation of objects made to his own designs with an elaboration of the concept of space. Within this context, the eighth Secession exhibition of 1900 and the Arts and Crafts exhibition – which presented examples of Moser's furniture alongside those of Charles Rennie Mackintosh's "Glasgow Four" group, who participated at the invitation of Fritz Wärndorfer – deserve special mention for the pioneering nature of the work displayed. Moser exhibited a corner cupboard for vases, *The Enchanted Princesses*; the sideboard *The Bountiful Draught of Fishes*; and a cigar cabinet with rich marquetry made by Portois & Fix; glass receptacles and wine glasses designed for Bakalovits; and carpets and woven fabrics produced by Backhausen. His furniture was influenced by the ideas of the English designers C.F.A. Voysey and M.H. Baillie Scott, and, unlike Hoffmann's, Moser's work contrasts the stereometric austerity of the basic forms with the two-dimensional inlay and beaten-metal decoration on the polished surfaces. The sideboard was used again in a dining room of 1903 and was copied by a variety of cabinet-makers. In his design for the 1902 Gustav Klimt exhibition, Moser arrived at a style of absolute simplicity: white walls were framed by grey borders, and seats whose basic form was the cube, repeated the shape of the space and the square motif in the decoration. Moser, whom contemporary critics referred to as the inventor of the "chessboard pattern", thus defined his version of the minimal, something he varied in every media, from fabric to glass.

In 1901 Moser's house within the Darmstadt artist's colony on the Hohe Warte was completed. This was designed by Hoffmann with an interior by Moser himself. In 1902 Moser designed the decoration for the picture gallery in a house belonging to Wärndorfer, the textile manufacturer who later financed the Wiener Werkstätte. Combining areas of flat white with small wooden columns, this design is reminiscent of elements of Mackintosh's work but Moser's own colour accents appear in the blue borders that run along the edges of the walls.

Moser's close collaboration with Hoffmann from 1899, first at the School of Arts and Crafts and subsequently in the Secession after Olbrich's departure, led to their co-founding of the Wiener Werkstätte in 1903. Moser's bias towards decoration formed an important counterpart to Hoffmann's linear

austerity of design and was to exercise a strong influence within artists' studios until Moser's resignation in 1907. During the first years of the Wiener Werkstätte, both artists worked co-operatively with each other to develop a style of furnishing which was to provide basic geometric forms for all kinds of craft objects. The interior designs emphasize surface flatness. The utility furniture is characterised by white surfaces with coloured borders; veneering and inlay work defines the incidental furniture.

Moser and Hoffmann designed the furnishings for the rooms of the Wiener Werkstätte in Neustiftgasse together, but the colour codes – meaning the unified colour arrangement of each individual studio – were Moser's idea. The joint furnishing of the Flöge sisters' fashion house in Mariahilferstrasse followed shortly after (c.1903).

The 1903–04 writing desk for the Wärndorfer family was one of the first pieces of furniture made in the Wiener Werkstätte workshops. It had a push-in chair and was made in ebony, with a cubical basic form, geometrical borders and inlaid mahogany figures that accentuate each surface.

In 1903 Moser also designed furnishings for a young couple, Dr. Holzl and his wife. Everything, from the metal chandeliers, the wall coverings and the carpets to the furniture, was made to Moser's designs, and the commission, which is well documented in contemporary photographs, demonstrates his style particularly impressively. It included red, yellow and white painted pieces of furniture – tiled in the kitchen – in the utility and domestic rooms, and furniture symmetrically veneered with precious woods in geometrical patterns for the owners' private and function rooms. The floor coverings and wallpaper are grey, yellow and brown and bring floral and geometrical patterns together within the same room. This dwelling represents Moser's transition from the so-called "plank style" to more three-dimensional forms, and it also demonstrates the continuation of his desire for a universal form of design. Unlike Hoffmann, Moser never turned completely towards the black-and-white style; colour and flatness – which exclude stark contrasts – always remained important elements within his designs.

Moser's furnishings for Margarethe Hellmann's wedding (1904) represent some of his most sophisticated work in the field of furniture-making. In contrast to his other pieces, the cabinets, the table, the armchairs and the stool in black-stained maple are completely free of inlay work. Only the oval fields with their incised lozenges that form the tabletop, the pattern on the glass doors and the panels on the backs of the chairs – as well as the tinplated sleeves on their legs – moderate the austere effect. The shape of the armchairs is close to Anglo-Saxon models; the pieces of black "box furniture" find their counterparts in pieces designed by Hoffmann at the same time.

Moser and Hoffmann's collaboration on the Purkersdorf Sanatorium, built for Otto Zuckerhandl in 1904, is well known. Here, Moser complemented Hoffmann's austere blue-and-white style with his white-painted pieces of furniture with their concave, "hygienic" bodies and spherical brass feet and with his coloured textile accents.

In 1905 Moser worked on designs for the windows and the high altar of the church belonging to the nursing home, Am Steinhof, a project led by Otto Wagner; only the glass windows were executed. During the same year, pieces of furniture were

made for the living room and the bathroom of Dr. Stoneborough's apartment in Berlin, which Moser furnished with Hoffmann. In the drawing room there were black-stained armchairs with coloured covers, along with a bureau and a bookcase using the clean, unadorned shapes that characterized Hellmann's apartment and "hygienic" white, polished items of furniture of the kind designed for the sanatorium at Purkersdorf. The interdependence between Hoffmann and Moser was so strong during this period that it is often difficult to separate their designs.

Moser's contribution to the hunting lodge that Hoffmann built for the Wittgenstein family in 1906 on the Hochreith near Vienna was limited to the creation of the coloured glazing for the door of the antechamber to the drawing room. In 1906 Hoffmann and Moser were once again jointly involved in furnishing the Berlin offices of the bentwood furniture company J.& J.Kohn; both were also active at this time as furniture designers for Kohn. Contemporary photographs attest to Moser's contribution to the convex, outwardly swelling façade design in dark metal: he designed two glass paintings with stylized female figures in the bay windows, ordered by dividing mullions, on the mezzanine floor.

With his departure from the Wiener Werkstätte in 1907 and his return to painting, Moser's activity in the realm of interior decoration was curtailed. His last projects include two bureaus with armchairs similar to those created for Fritz Wärndorfer exhibited at the 1908 Vienna art exhibition and a cupboard with inlay work shown at the 1911 exhibition in Rome. The Austrian art critic Berta Zuckerhadl summarised Moser's contribution to interior design in 1905 when she described his work as demonstrating "the pull towards purity of form, the desire for noble proportions, the search for the constructive, the avoidance of the overly decorative, the love of simple outlines, the tendency towards symmetrical constructions".

RAINALD FRANZ

See also Hoffmann

Biography

Born in Vienna, 1868. Studied painting at the Akademie der bildenden Künste, Vienna, 1889–92; studied design at the Kunstgewerbeschule, Vienna, 1892–95. Designed illustrations for the *Wiener Mode*, from 1892, and contributed to the *Allegories* folios published by Martin Gerlach, 1895. Formed the progressive art Siebener Club with others including Josef Hoffmann and J.M. Olbrich, 1895; met Gustav Klimt. Founder-member of the Vienna Secession, 1897 (left 1905); participated in many Secession exhibitions, organised the Secession section of the Austrian Pavilion at the 1900 Paris Exposition Universelle, and contributed numerous illustrations to *Ver Sacrum* from 1898. Appointed Professor of Painting, School of Applied Arts, Vienna, 1899; Director, 1900–18.

Co-founder, with Hoffmann and Fritz Wärndorfer, of the Wiener Werkstätte, Vienna, 1903; designed furniture, jewellery, metalwork, leather, toys and bookbindings, and edited the Werkstätte's magazine, *Hohe Warte*. Also collaborated with Hoffmann on numerous interiors from c.1902. Left the Werkstätte in 1907 and returned to painting. Died in Vienna, 1918.

Selected Works

Important collections of drawings and documents relating to Moser's work are in the Wiener Werkstätte Archives, Austrian Museum of Applied Arts, Vienna, and in the Archives of the Hochschule für

Angewandte Kunst, Vienna. The Austrian Museum of Applied Arts also holds examples of Moser's furniture, textiles, wallpapers, jewellery, metalwork and graphic work.

Moser designed furniture, glass, jewellery, leather, book covers, textiles, wallpapers, metalwork, stained-glass windows, stage sets, ceramics, toys, and graphics from the late 1890s. His jewellery was produced by Rozet and Fischmeister, Vienna; he designed porcelain for Josef Böck, textiles for Johann Backhausen and Sons, and glass for Bakalovits, and much of his furniture was made by commercial firms including Caspar Hrazdil and Portois & Fix.

Mudéjar Style

After various occupations that began in pre-Roman and pre-Christian eras, Spain suffered yet another invasion at the outset of the 8th century AD, this time by the Muslims of North Africa whose rulers were as far away as Baghdad. Spanish faith practised under the Visigoths was Roman Catholic, but as their weakened country succumbed to the invaders, they found themselves subject to two religions with the accompanying variations in culture and style. For more than three centuries Muslim rule dominated most of the country, reaching beyond the Pyrenees and the Guadarrama and known as *al-Andalus*. It reached Segovia, Soria and further north but was before long repelled by Christians to the more stable line on the Tagus. Cordoba became the capital of the Caliphate of the western Islamic world in 929, but its early power was waning and it sought help from the Mahgrib – an area covering the western part of North Africa. This was given by the puritanical Almoravids under the 70-year-old Emir Yusuf, but, when his son succeeded, the power which Yusuf had won was soon lost through rebellion and massacre in Marrakesh by another even more strict "unitarian" sect – the Almohad Berbers – in c.1147. Parts of Islamic Spain were on the edge of decline, and the Christians under Alfonso VI had already been able to take Toledo in 1085.

This complex historical background inevitably affected architecture and decoration, and according to the historian Bernard Bevan, later "in the middle of the 13th century *nine* architectural styles existed side by side! Even after the unification of Christian Spain, the defeat of the Muhammadans, and the banishment of the Moriscos, there were seldom less than five styles in vogue at one and the same time". One of these was the Mudéjar style, which was defined as Muslim work and

Mudéjar Style: view across the Patio de las Muñecas to the apartments of Maria de Padilla, Alcázar, Seville

workers under Christian rule and which followed Mozarabic work by Christians under Islamic rule.

The Mudéjares made use of the conservative design and craft traditions long exercised by those Muslims in Spain who, as the *reconquista* or reconquest progressed, adapted themselves to the different requirements of Christian culture. Variants developed in Castile and Aragon but are generally more applicable to exterior work than to interior design. Late Muslim and Mudéjar styles, particularly the latter, produced more sacred than secular buildings but important to their joint achievements was the introduction of plasterwork and stucco on which decoration was applied with immense skill for domes, wall surfaces and other architectural features. The two styles are closely related in many respects and produced masterpieces of world heritage class in a field of quite restricted scope in the southern part of Spain.

Late Muslim architecture was crowned by the Alhambra, Granada, the finest example of Maghribian decoration, with its many courts, with halls and smaller rooms all exemplifying what we still think of, incorrectly or not, as "Moorish". Although started in the 12th century, the two main palaces surviving are later work, being that of Yusuf I (1334–54) and of Muhammad V (1354–91). Stalactite or honeycomb capitals, arches and ceilings form "a haven of pleasure and luxury, the perfect expression of the minds of men who had cultivated the habit of ease" (Bevan, 1938). The decorative plasterwork was carried out by two methods; it was either marked out with the design on its surface and then incised by hand, or applied in moulded sections to a smooth base, which gave a slightly less crisp outline effect. Repetitive patterns in great variety of floral and geometric motifs and combinations showed considerable ingenuity and were used for both *azulejo* glazed tile dadoes and wall panels and for carved plasterwork on upper parts of walls and for cornices. Calligraphy is a highly valued component of Islamic art and, with the representation of living things prohibited under Muslim law, it occupies a position similar to that of the human figure in Christian culture. To Muslims, words rather than pictures conveyed God's message to man. Most of these characteristics were also embodied in the Mudéjar style although the calligraphy began to disappear and different motifs such as the scallop shell and various heraldic emblems crept in.

Synagogues to serve large Jewish communities and many parish churches in smaller towns arose in the wake of the reconquest, but space allows only for mention of the most innovative and exceptional of these Mudéjar interiors. It should be remembered that skilled labour was scarce in a sparsely populated land and, with the departure of many Muslims back to North Africa at various times, craftsmen who were native to and remained in the re-Christianised provinces and towns were generally respected. Their abilities can be appreciated in the exterior ornamental brickwork of church towers, many having developed from minaret predecessors, and their design announcing the special Mudéjar qualities.

In Cordoba, capital of *al-Andalus* in the 10th century, the Great Mosque, La Mezquita, focused early Mozarabic building as a highly accomplished architectural achievement. This admirable style changed after the decline of the Western Caliphate and the Christianisation of the mosque into altogether more modest essays in Mudéjar design. The Capilla

Real was built for Alfonso X in 1258–60 and, with the Puerta del Perdon and Puerta de las Palmas, all reflect the new regime. The Cordoban synagogue in the Jewish quarter was built by Simon Meheb in 1315, its Mudéjar decoration finely cut in plaster beneath a seven-lobed arched colonnade. At Baena, some miles from Cordoba, the Convento de la Madre de Dios still contains relatively undisturbed carved wood ceilings which are very characteristic features but which only too frequently have failed to survive.

Toledo, the first prize of the reconquest in 1085, possesses a well-restored 14th-century Mudéjar Puerta del Sol and a much earlier small mosque-turned-oratory, Cristo de la Luz, in Mozarabic style with added Mudéjar apse decoration. Though once again a sacred, not secular, building Santa Maria la Blanca is too important to be omitted. A synagogue was first built on the site in the 12th century and the present building was rebuilt on the same foundations in 1250, being appropriated for Christian use after the expulsion of the Jews at the end of the 15th century. Horseshoe arches surmount octagonal plastered brick piers with extraordinary fanciful capitals "like fishnets full of fir cones" (Goodwin, 1990). These divide the space into five aisles, and decoration in the spandrels and above the arches is in fine interlaced carved plaster typical of the best of the form. A second Toledan synagogue, del Transito, was later built in 1357, for Simon Levi, Treasurer of Castile. It also has high quality workmanship. Hebrew inscriptions frame a sinuous tree of life frieze truly arabesque in character and elsewhere coats-of-arms of Castile and León are incorporated. Stucco panels and more *laceria* interlaced designs, fine carved timber work in dark wood for the ceiling and decorative floor tiles help to complete a remarkably integrated interior. The cathedral chapter house has a coffered gilded Mudéjar ceiling and there is also a 13th-century workshop where stone was re-cut from the old Friday mosque for cathedral use. This contains unexpectedly lavish friezes and surrounds to windows and doors in plasterwork while geometrical star and octagon patterns ornament the characteristic ceiling.

Seville contains the major examples of Mudéjar interior design, with the Alcázar fortified palace, heading a regrettably short list. From an early foundation in 712, soon after the Muslim invasion, it underwent many changes, but the reconquest brought the most remarkable one. Under Pedro I, named the Cruel, it took on much of the character of a luxurious Muslim palace even though created by a Christian king. Relations between Muslim and Christian rulers could be remarkably good, and in 1364, soon after completion of the celebrated Maghribian works to the Alhambra, Muhammad V in Granada generously made his carpenters and plasterers available to Pedro in Seville. Strong similarity to the Alhambra therefore appeared in the Mudéjar Alcázar, with domed and ceilinged apartments planned around colonnaded fountain courts. Although both complexes may have been built by the same craftsmen there are many differences in detail. Byzantine or Gothic influences, human hands and faces and an inscription to Pedro all find their way into the basic Maghribian formula of *azulejo* tiled dadoes and incised or moulded wall panels surrounding cusped, horseshoe and corbelled arches. Carved openwork screen walls in the Patio de las Doncellas echo the pine cone motif of the capitals in Santa Maria la

Blanca and a modified version of the Alhambra's honeycomb fantasies becomes an elaborate run of cornice in the Alcázar. Ceilings of carved wood called *artesonado* were a Mudéjar speciality often designed, in the absence of large trees for building timber, to use smaller components. Bevan analyses six categories of ceiling structure from flat crossed-beam to deeply recessed polygonal coffered types. An outstanding domed ceiling to the Salón de Embajadores in the Alcázar, supported by honeycomb or stalactite pendentives, was constructed by Diego Ruiz in 1427. All these permanent, decorated surfaces were offset in the residential context by Spanish brocades and other silk hangings where degrees of privacy and some protection were desirable. However, furnishings do not occupy an important place in a style employed rather more for exterior than interior purposes. Tordesillas in Old Castile, a former palace of Pedro the Cruel, manifests all his favourite Mudéjar elements, fortunately preserved through its subsequent use as the Convento de Santa Clara.

Other late mansions survive in Seville, both of which contain *artesonado* ceilings. The Palacio de las Dueñas dates from the 15th century and the Casa de Pilatos, begun in 1480, has much fine tile and plasterwork. But in the main 16th-century courtyard of this latter building, the Mudéjar style begins to lose conviction and to fade in the strong approaching light of the Renaissance.

Munthe, Gerhard 1849–1929

Norwegian painter and designer

The artist and designer Gerhard Munthe was a leading figure in the Norwegian Aesthetic Movement and played an important role in the resurgence of Norwegian design in the late 19th and early 20th century.

Munthe was trained as a painter in Christiania (now Oslo), Düsseldorf and Munich, and his early work was executed in a fairly conventional naturalistic style, but from the mid 1880s

more abstract and decorative elements began to enter his work. This change was inspired by his growing admiration for Japanese art which also awakened an interest in indigenous Norwegian literature and forms. In 1891 Munthe declared "it has been ages since a Norwegian idea lay behind the manufacture of carpets; there has never been one in wallpaper, [and] our two porcelain factories have never given it a thought that this might be a possibility", and, borrowing motifs from traditional Norwegian legends, medieval tapestries, woodcarvings and the local fauna, he argued for the development of a native form of Aestheticism. At a time when Norway's union with Sweden was entering its last phase – it was dissolved in 1905 – and nationalism was running high, this movement evoked strong responses and was greeted with considerable enthusiasm.

Munthe exhibited several wallpapers at the national exhibition of 1891, some of which were later produced by Frølich's Wallpaper Factory in Christiania. While the names of individual designs, which included titles such as *Small Trouts*, *Marsh Marigolds*, and *Stars and Pinetrees*, suggested the use of distinctively Norwegian ornament, the asymmetrical compositions and tertiary, "greenery-gallery" colours were clearly based on Japanese prototypes. A series of eleven drawings for decorative panels exhibited in 1893, which were based on Norwegian fairy tales, showed a similar disregard for naturalistic conventions and prompted the art historian Jens Thiis to declare: "Munthe has precisely this attentive sense for details, such as contours and splashes of colour, that the Japanese possess to such a great degree". The main motifs in these panels were accompanied by contrasting patterns and stylised figures and animals, and were drawn with marked contours as in Japanese woodcuts and designs. Their primitive simplicity and lack of perspective also recall the appearance of ancient Norwegian tapestries and the panels were themselves later woven as tapestries in the workshop established by Thiis in 1898. Prior to this, however, in 1897–98 several panels were executed as woodcarvings in Munthe's Fairy Tale Room in the Holmenkollen Tourist Hotel, Christiania.

Designed by the architect Ole Sverre, the Holmenkollen Hotel epitomised the Viking Revival, or so-called Dragon style, which became increasingly popular as a symbol of growing nationalism in the late 19th and early 20th century. However, Munthe's Fairy Tale room was less inspired by stave churches and Viking ships and represented an innovative fusion of Nordic with Aesthetic and Art Nouveau influences. The *horror vacui* of the decorations as a whole, and the chairs crowned with an oriental peacock, recalls J.M. Whistler's celebrated Peacock Room which was probably known to Munthe. The asymmetrical lower sections of the tables and chairs also resemble similar furniture created both by the French Japoniste, Emile Gallé, and by English manufacturers of Art Furniture. Once again, the colour scheme was light and "greenery-gallery". These colours, along with ornament and furniture from the Fairy-Tale room, were incorporated within Munthe's Sala Norvegese at the Venice exhibition in 1907. The room attracted widespread admiration and was described by critics as "original and elegant".

Munthe used a similar colour scheme in the interiors of his own villa, Leveld, outside Oslo, which he decorated in 1898–99. The hall and reception rooms were decorated in

Munthe: interior of the Munthe house, Leveld, Lysaker, c.1898

yellow and green and included stylised ornaments associated with the simple, homely elements found in traditional Norwegian interiors. Friezes including overlapping and juxtaposed motifs, and Japanese earthenware displayed on the mantelpiece reveal Munthe's continuing admiration for Japanese art. The furniture includes some pieces that have the same swooping lines as the Fairy Tale Room peacock chairs, and some items that have straight and angular contours and are based on Norwegian vernacular country chairs.

Munthe's furniture and interiors have much in common with those created by Carl Larsson at Sunborn in Dalarna. Larsson's drawings were exhibited in Stockholm in 1897, and his and Munthe's homes became models for the Modern Movement in interior decoration in Scandinavia.

By the end of the century Munthe had become the most successful and innovative decorative artist in Norway and he received numerous commissions for interior decoration. His interiors at the Strand mansion in Numedal, which he decorated for the consul Axel Heiberg in 1898, recall those at his own house and employ a similar range of light, bright colours

combined with Japanese- and medieval-inspired stencilled ornament. He also designed a number of woven hangings based on animal themes such as Moose and Hare for the walls of this house, and the rooms included antique Norwegian country furniture and rugs, and colourful *imari* porcelain. By drawing on both oriental and native sources Munthe was following a pattern set by many other European designers who had associated the feudal art of Japan with Western folk-art traditions.

Munthe executed many private commissions during the first quarter of the 20th century, the most interesting of which was the decoration of the dining room for the consul Cathrinus Bang in Christiania from 1901. Although Norwegian decorative traditions were to become more important in Munthe's later interiors, in this room the influence of Japanese design is still dominant. The walls are faced with painted panels that resemble the shape and format of a Japanese screen and that illustrate a landscape with fruit trees. Munthe himself described this decoration "as merry as Japan". In 1907 he designed a set of chairs for the dining room. These were based

on a Norwegian Rococo prototype but incorporated undulating lines and stylised floral motifs similar to those found in French Art Nouveau furniture.

Among the most important of Munthe's public commissions were the ground floor interiors of the new Museum of Applied Arts in Oslo (1903) and the reconstruction of the Håkonshallen castle in Bergen (1910–15). For the Museum of Applied Arts, Munthe drew inspiration from Norwegian Baroque wood-carvings and so-called rose-painting, which he combined with Art Nouveau ornament. Doorframes, panels and decorative ceiling borders were embellished with stencilled decoration which created a colourful, decorative effect perhaps better suited to a folk museum than a Museum of Applied Arts and the decorations were subsequently destroyed. Håkonshallen castle was Munthe's largest project and, as with his Fairy Tale room, he was responsible for every aspect of the interiors. He designed carpets, furniture, light fittings, stained glass windows, textiles, and painted decoration for the walls and ceilings. Although their style was inspired by medieval examples, their freshness and newness reveal Munthe to have been a precursor of the Modern Movement in Scandinavia.

WIDAR HALÉN

Biography

Gerhard Peter Frantz Wilhelm Munthe. Born at Skanshagen, near Elverum, 19 July 1849, the son of a district doctor. Gained scholarship to J. F. Eckersberg's painting school, 1870, and subsequently to Morten Müller and Knud Bergslien's school, 1870–74. Also studied with Julius Middelthun at the Royal Drawing School, Christiania (Oslo), 1870–73. Gained several prizes, including the Schäffer prize, 1871, 1875, and State Travel Grant, 1876 and 1877. Began his career as a painter. Several summer study-trips to Norway, 1871–74, and to Italy and Austria, 1882. Stayed in Düsseldorf, winters of 1874–76; lived and worked in Munich, 1877–82. Travelled and exhibited extensively in Scandinavia and elsewhere in Europe, 1882–1925. Paintings and watercolours used as tapestry designs from 1893. Designed for Porsgrund Porcelain Manufactory from 1890s. Turned increasingly to interior decoration, producing wallpaper and tapestry designs during 1890s. Also designed book illustrations and covers from 1896. Married Sigrun Sandberg, 1886 (divorced 1919). Won Silver medal at World Exhibition, Paris, 1889; gold medal at World Exhibition, Paris, 1900; gold medal at Munich, 1901; Grand Prize, St. Louis, 1904; gold medal, Venice, 1907; 2 medals at Barcelona, 1907. Knight of Dannebrog, 1884; Knight of the Polar Star, 1897; member of the Academy of Fine Arts, Stockholm, 1904. Died in Baerum, 15 January 1929.

Selected Works

Munthe's paintings and drawings are represented in all the major Scandinavian museums, and in Krefeld and Barcelona.

Interiors

- 1896–98 Holmenkollen Tourist Hotel, Christiania (Fairy Tale Room)
- 1898 Villa Stupet, Fjøsanger (interior): C. Mohr
- 1898–99 Strand Mansion, Numedal (interiors and woven hangings): Axel Heiberg
- 1898–99 Leveld Villa, Lysaker (hall and reception rooms): Gerhard Munthe
- 1900 Haugboløkken, Asker (dining room): Mrs A. Mowinckel
- 1901 & Bang Villa, Kra (dining room and furniture): Cathrinus Bang
- 1907 Museum of Applied Arts, Oslo (ground floor interiors)
- 1907 "Sala Norvegese", Venice Exhibition
- 1908–09 Villa Solbakken, Skøyen (decorations and furniture): O. Stang

- 1910–15 Håkonshallen Castle, Bergen (reconstruction of interiors, furniture and textiles)
- 1911–12 Oslo Stock Exchange (staircase paintings)
- 1913–14 Lagåsen, Lysaker (reception room): A. F. Klaveness
- 1913–14 Dr. Brandt's house (drawing room), Kra
- 1915 Ekeberg gård (drawing room): A. F. Klaveness
- 1916 Lille Reistad, Lier (drawing room, moved to Town Hall, Sanvika): G. A. Svensen
- 1917 Ström residence, Kra (billiard room): Grosserer Ström

Muthesius, Hermann 1861–1927

German architect and architectural theorist

Hermann Muthesius was one of the most influential German architects at the beginning of the 20th century. His reputation was based both on his practical work and on his writings. He

was one of the leading architectural theorists who opposed academic historical styles of building. Along with numerous residential buildings designed in what has been termed the English vernacular style, he created small farm units (for instance, Dresden-Hellerau, 1910; Berlin-Altglieneke, 1913) and a number of factories (for example, the silk weaving mill for Michels & Company in Nowawes-Potsdam). And as a co-founder of the Deutscher Werkbund (1907) and a champion of standardised furniture, he played an important role in promoting the idea of the mass production of craft objects.

Although Muthesius spent several years in Japan working for the Berlin architectural firm of Ende and Böckmann early on in his career this stay had little impact on his later work. Some years later he was sent by the Prussian ministry of public works to England where he worked as a technical attaché at the embassy in London between 1896 and 1903. His job was to study the English reform movement, spearheaded by William Morris, John Ruskin and Norman Shaw, in the arts and crafts and architecture. He published numerous writings on the English house and garden and interior design, and his views represent a German interpretation of the English Arts and Crafts movement. Of particular importance were the publications *Die Englische Baukunst der Gegenwart* (Contemporary English Architecture, 1900), *The English House* (3 vols., 1904–05), and *Landhaus und Garten* (Country House and Garden, 1910). His *Stilarchitektur und Baukunst* (Style-led Architecture and Architectonics, 1902) was the most successful German diatribe against academically-historicising architecture and Art Nouveau. These theoretical works were conceived as a discourse on building and interior furnishings and described the history and recent developments in English country houses. English examples provided the models of simplicity and function that Muthesius took as his starting point in the reformation of German architecture, the layout of ground-plans, interior design, and the arts and crafts. His conception was based on the residential building as a synthesis of the arts (*Gesamtkunstwerk*), in which architecture, the organisation of space, and interior decoration, should all relate to each other and to the garden. He discussed features such as lighting appliances, door handles, heating, fittings and furniture in just as much detail as the ground plan. A rejection of style-led architecture and an emphasis on functional fittings made of appropriate materials and in a form suited to their purpose echoed the teachings of the English reform movement and played a decisive role in his thinking.

After his return to Germany, Muthesius was once again active as an architect, and began to design residential buildings chiefly in Berlin and its surrounding areas. These were said to be in the “English Country House Style” but Muthesius himself rejected this description. He sought alternatives to the dominant form of architectural composition, in which the interior organisation was determined largely by the ordering of the façade, and where the lavish furnishings were designed in historic styles and paid little heed to the everyday needs of the consumer. Instead, Muthesius developed buildings which, through their concern for function, comfort and absence of ornate decoration, put the requirements of their inhabitants first. Many of his houses consciously drew upon English models but because they were subject to different needs and

conditions, he was not always able to translate his theories into practice.

Although Muthesius’s buildings were more often suburban homes than country houses, he nevertheless took account of their topography and the direction of the sun wherever possible. German clients placed less emphasis upon space-saving, and would not allow rich decoration to be sacrificed completely. Contrary to his writings, Muthesius generally adopted the spatial arrangement of the bourgeois villa. But just as in his English models, rooms designed as complex organisms with annexes and with a particular relationship to the garden became a characteristic feature of his German residential work. And in opposition to contemporary German practice, he designed his buildings from the inside out, allowing the interior structure to determine the exterior architecture. In his furnishings – of which virtually no examples survive – he opposed the lavish decoration that had become widespread since the industrial expansion of the 1870s, and favoured fitted wall units and walk-in cupboards. He also pioneered the unification of the interior and exterior architecture, including window openings, wall panels, ceiling borders and embellishments and fireplaces in his designs. Muthesius frequently linked rooms with louvred doors, or opened them to the garden with various types of large bay and French windows. Most of his buildings contained a hall with a stairwell that rose to the second floor and provided access to individual rooms. This hall served as the communication link between the different units of space.

Muthesius’s most famous houses were built in the period between his return from England in 1903 and the start of World War I. The Freudenberg House (1907–08) in Berlin-Nikoleisee is one of the best-known examples. This house has two wings which form a right angle, with the entrance placed at the centre where they join. In contrast to the freer arrangement and ordering of the façades of English models, Muthesius adopted a symmetrical solution for his façade. The building culminates in the two-storey hall. The rest of the ground plan is a “jigsaw puzzle” as Muthesius himself once described his designs, in which accentuated symmetry is combined with the agglomeration of independent rooms.

At the Cologne Werkbund exhibition in 1914, Muthesius designed the pavilion for the Colour exhibition in which the colourful phenomena of nature and the products of the dye industry were displayed in opposition to each other. He believed that sensitivity to colour – primarily in the fields of interior design and fashion, could be influenced in an educational way. Friedrich Deneken, the initiator of the Colour exhibition, and Muthesius both attached particular importance to colour as an aesthetic dimension and they conducted a practical lesson in colour in the design of the Hamburg-America Line’s (Hapag-Lloyd) pavilion. This included the so-called Kaiser Rooms from the steamship Bismarck which were designed by Muthesius. The interior decoration was intended to reflect an elitist, luxury-conscious setting that corresponded exactly to the shipping line’s requirements. The furnishings included wicker furniture, jardinières with fluted bases, round tables with ruched cloths, and panelled walls sometimes veneered with exotic woods. The seating incorporated the pleasing modification of the half-cylinder form that was favoured by Muthesius. The richness of this interior clearly

conflicted with Muthesius's writings and was determined by the client's brief.

The founding of the Deutscher Werkbund, in which Muthesius had played a decisive part, represented an important milestone in the development of Modernist design. Muthesius had joined it as a vehement supporter of the standardisation of industrial products. Unlike Henry van de Velde, another founder, who argued for the freedom of individual artistic expression, Muthesius attempted to promote the concept of standardisation in product development. The craftsman was to work in co-operation with industry and focus on the design of standardised forms, thus determining the style and quality of mass production. Muthesius used the expression "Standardisation" to suggest the creation of a limited number of universally-applicable models to designers which he regarded as essential if the quality of mass-produced German goods was to be improved. Both camps – pro-Standardisation and pro-Individualism – had their supporters in the Werkbund and the clash between the two opposing factions provoked the celebrated debate between Muthesius and van de Velde at the Werkbund exhibition of 1914. Going beyond the methods espoused by the Arts and Crafts movement in England whereby the designer worked as an independent craftsman, Muthesius called for a close co-operation between the designer and industry so that a definition of the purpose and nature of industrial design could be achieved. His goal was the modernisation of craft and industrial production in all the areas in which man shaped his environment. Just as he strove for a simplification and avoidance of historical styles in architecture, so too he wished to reform the industrial arts and crafts through a rejection of stylistic imitations and the creation of new aesthetic forms.

Muthesius's chief claim to fame lies in his defining the nature and purpose of design and in his influence on machine production. In making such issues the subject of public debate, he deserves recognition as a pioneer of modern industrial and product design.

Biography

Born in Gross-Neuhausen in Thuringia, 20 April 1861, the son of a stone mason. Studied philosophy at the University of Berlin, 1881–83; trained as an architect at the Technische Hochschule, Berlin, 1883–87. Married the singer Anna Trippenbach, 1896. Worked under the architect Paul Wallot, Berlin, before 1887; active as an architect in the office of Ende and Böckmann, Tokyo, 1887–91; appointed a government architect, 1893, and worked in the Prussian Ministry for Public Works, 1893–94; edited the official architectural journal, *Zentralblatt der Bauverwaltung*, 1894–95. Travelled to Italy, 1895–96. Served as a cultural attaché in the German Embassy, London, and made a study of English architecture and design, 1896–1903. Worked in the Prussian Ministry of Commerce, 1904–26; active as an architect, journalist and writer, Berlin, from 1904. Founder-member and director, Deutscher Werkbund, Berlin, 1907; co-organiser, Werkbund exhibition, Cologne, 1914. Published numerous influential books on architecture and design from 1900. Died 26 October 1927.

Selected Works

Interiors

- 1904–05 Bernhard House, 11 Winklerstrasse, Berlin (building and interiors)
- 1906 Neuhaus House, 56–58 Bernadottestrasse, Berlin (building and interiors)
- 1906–09 Muthesius House, Potsdamer Chaussee 49, Berlin (building, interiors and furniture)
- 1907–08 Freudenberg House, Potsdamer Chaussee 48, Berlin (building, interiors and furniture)
- 1908 Schweitzer House, Berlin (building, interiors and fitted furniture)
- 1908 Kosmack House, Ruppiner Platz, Berlin (building and interiors)
- 1911 Burlet House, Schlichtweg 12, Berlin (building and interiors)
- 1912–13 Mohrbutter House, Schlichtweg 6, Berlin (building and interiors)
- 1914 Zuckerkandl House, Königsallee, Berlin (remodelling, interiors and furniture)
- 1914–15 "Der Mittelhof" villa, Berlin (house and interiors)
- 1916–18 Bredow House, Miguelstrasse 92, Berlin (building, interiors and furniture)
- 1922–24 Kersten House, Charlottenburg, Berlin (building and interiors)
- 1924–25 Tuteur House, Charlottenburg, Berlin (building and interiors)

N

Nancy, Ecole de

Ecole de Nancy is the name given to a group of artists and designers working in Nancy, the capital of Lorraine, in the decades around 1900. Led by Emile Gallé, the group included Louis Majorelle, Eugène Vallin, Jacques Gruber and Victor Prouvé. They produced furniture, glass, metalwork and ceramics in a strongly realistic Art Nouveau style basing much of their work on organic forms, particularly plants. Their association was not formalised until 1901 with the foundation of the Alliance Provinciale des Industries d'Art with Gallé as president. By this time, Nancy was matched only by Paris in the production of high quality decorative art and interior design.

Nancy and the province of Lorraine had been important glass-making centres since the end of the 15th century, and when Stanislas Leszczyński was made Duke of Lorraine and Bar after his abdication of the Polish throne in 1736, he came to Nancy and made it a cultural and architectural centre. Luxury trades such as textiles, furniture, leather working and ceramics were established and attracted skilled craftsmen from a wide area.

In the aftermath of the Franco-Prussian War of 1870–71, Nancy remained part of France while Alsace and much of Lorraine were ceded to Germany. Many Lorrainers, particularly those with capital and craftsman's skills, moved to Nancy and its environs, while the French government established a large garrison there (at times up to 10,000 strong), and encouraged local industry and development, and a strong regional identity as a buttress against further incursions.

One such incomer was Charles Gallé, who had moved there in 1844. An astute businessman, he took over his father-in-law's mirror factory and expanded it to make tableware, as well as taking over a small faience factory at St. Clement. It was his son Émile, however, who was to become arguably the leading figure in the French Art Nouveau movement.

Charles Martin Emile Gallé (1846–1904) was a prize pupil at the Lycée Impériale, Nancy, where he was fascinated equally by art and botany. In the twelve years after leaving school in 1861 he travelled widely, studying mineralogy, botany and art history in Weimar, before working for five years in various factories, including Meisenthal where he studied both ceramic and glassmaking techniques. On his first visit to London, he spent much of his time studying the glass collections at the British Museum and the recently founded Victoria and Albert

Museum, and at Kew Gardens. During the Franco-Prussian War he served in the 23rd Infantry Regiment of the French Army and the following year, 1871, acted as his father's representative at the Art of France exhibition in London before travelling to Italy, Switzerland and Paris. By now both Meisenthal and St. Clement were in German occupied territory and in 1874 Emile assumed control of the family firm in Nancy, bringing the ceramic works and many workers from St. Clement.

Gallé became known principally as a maker of fine glass and furniture. His early glass was essentially traditional, clear or only lightly tinted, and often decorated with enamel motifs derived from 18th-century models. To these he added flowers and insects precisely copied from nature – a feature which was to remain characteristic of his work throughout his career. At the Paris exhibition of 1878 he first saw the work of some of his more adventurous contemporaries such as John Northwood's cameo glass and François Rousseau's carved and applied glass. Gallé determined to explore the possibilities of the material for the rest of his life.

By 1883 he had expanded his workshops, established a studio for his researches and two years later added a carpentry workshop, initially to make stands for his vases.

Although Gallé's furniture was not as innovative as his glassware, it was still highly distinctive and was well received. His early pieces were somewhat ponderous, but his style soon became lighter and more ornate, combining detailed leaf and flower forms with Rococo influences and the abstract tendencies of Japonisme. Natural forms were not restricted to details; whole arms, legs and backs were carved in plant or insect forms, curving or twisting to animate the whole. Soon, too, most of the flat surfaces were decorated with marquetry, becoming fields for the most extraordinarily intricate inlays featuring flowers, landscapes and pictorial scenes, and sometimes even poems and quotations. The craftsmanship was extremely fine and the range of items was extensive, including nests of tables, étagères, tables, desks, chairs, display cabinets, settees, mirror frames and even billiard cue holders. One of his last creations, and arguably his masterpiece, was the bed entitled *Dawn and Dusk*. Featuring greatly simplified forms, the high-point of this piece was its marquetry which illustrated the dark shadows of Dusk enveloped in the drooping wings of a fantastic insect on the headboard and a rising sun on the matching board at the foot of the bed.

Nancy: dining room by Eugène Vallin for the Salon d'Automne, 1910

However, it was in glass that Gallé made his greatest contribution to Art Nouveau. Constantly searching for new techniques and effects, he used more and more coloured and layered glass, adding metallic oxides, carving, engraving or etching to decorate the surface, and above all developing new freer shapes to produce a result that bordered on pure sculpture. Despite the complexity of these works, which involved a high percentage of failures and breakages, Gallé was fired by a desire to produce beautiful objects that could be manufactured cheaply and so become available to a wider audience. He reached this audience by showing his products at many of the major national and local exhibitions. Throughout the 1890s his fame spread as did his influence in Nancy where he actively encouraged the training of designers and craftsmen of all types at the Ecole des Beaux-Arts.

His glass production can be divided into several groups, each illustrating particular techniques or themes. His *Verreries Parlantes* (Speaking Glassware) were inscribed with quotations whose message was reinforced by the colour or form of the item. From these developed the *Poèmes Vitrifiés* (Vitrified Poems), where using the wide ranges of techniques which he had promoted evoked moods or images. *Vases de Tristesse* (Vases of Sadness) were a large group produced to inspire feel-

ings of melancholy with images of dying flowers, predatory insects, etc., often in shapes based on ancient funerary urns. Carved vases, often made of two or three layers of different colours, developed from the *Vases Noir* (Black Vases) introduced in 1889, where a clear glass vessel was overlaid with black or dark-brown glass before being carved to give high relief decoration. Gallé's aversion to hydrofluoric acid was overcome, and he used it to hollow the surface of a vessel before enamelling, or to soften carving in transferring the technique of marquetry from wood to glass in the late 1890s. Pieces of coloured glass were embedded in the surface of a gather of glass before the final shape was blown. On occasion he produced sculptures of natural objects or lamps which were once again reproductions of natural forms.

Many examples of these types were shown at the Paris Exposition Universelle of 1900 which not only acted as a showcase for the Art Nouveau style as a whole but also highlighted the importance of Nancy as a centre for the decorative arts. The Daum Brothers (Antonin and Auguste), for example, exhibited vases and other glassware that was heavily influenced by Gallé and that featured floral decoration, gilded or enamelled in the 18th-century manner. The most significant of the furniture designers was Louis Majorelle (1859–1926).

Majorelle trained as a painter under the artist François Millet at the Ecole des Beaux-Arts, Paris, but at the age of twenty his studies were interrupted by the death of his father and he was forced to return to Nancy to take up work as a product and interior designer in the family ceramic and furniture business. His mother and brother Jules took care of the retail side of the business. By 1884, Louis was also responsible for the supervision of the factory in the rue Girardet where he continued the family tradition of painted or lacquered furniture combining neo-Rococo (Louis XV), classical (Louis XVI) and Japanese styles. During the 1890s, probably inspired by Gallé, he turned to the more contemporary Art Nouveau style of which he became a supreme master. And he opened a new workshop with 30 employees, the Maison Majorelle.

In the work produced by the Maison Majorelle, Majorelle reinterpreted such traditional forms as the cartouche, the cabriole leg, the serpentine front and ormolu mounts, with naturalistic floral elements which came to differentiate the Nancy designs from those of Paris where plan-forms were more abstract. He produced exquisite individual pieces or suites of furniture using a wide range of exotic woods such as walnut, mahogany, amaranth, or purple-heart, with sweeping lines, high relief moulding or carving with naturalistic gilt-bronze mounts in the form of lilies or orchids. His mastery of marquetry equalled that of Gallé, but his pieces were more solid and used smoother lines. He exhibited a dining room and bedroom at the 1900 exhibition and in 1904 he purchased the Maison d'Art Nouveau from Siegfried Bing, which he opened as a Paris showroom. At the same time, he commissioned Henri Sauvage, designer of the 1900 Loie Fuller pavilion, and the Nancy architect Louis Weissemberger to build a house, the Villa Jika, which was entirely furnished and decorated using his designs.

Always responsive to contemporary taste, by 1908 Majorelle discerned a return to more classical styles and accordingly he modernised his workshop and adopted a simpler line in his furniture. Despite setbacks that included the destruction of his house during World War I, and the destruction of his workshops by fire in 1918, he continued to remain active as a designer until shortly before his death, acting as a jury member for the 1925 exhibition.

Eugène Vallin (1856–1922) had received little formal education after elementary school but had worked instead in his uncle's carpentry business before joining C.A. Claudel, a church-furnisher and restorer of old woodwork. He studied wood sculpture at the Nancy Ecole de Dessin before succeeding to his uncle's business. Fifteen years later he built a new workshop, having established himself as a designer in the Art Nouveau style. Rejecting factory methods, Vallin worked only to commission, where his designs reflected his early training. He also rejected the more decorative floral elements of his contemporaries, concentrating on solid, somewhat heavy furniture and interiors with strong sculptural features and whose principal decorative device was the curved structure and broad, linear rhythms of the furniture.

Jacques Gruber (1870–1936) was brought to Nancy as an infant and studied at the Ecole Municipale des Beaux-Arts before going to the Ecole des Arts Décoratifs et Beaux-Arts in Paris where he studied under the Symbolist painter Gustave Moreau. On his return in 1893 he both taught at the Ecole and

worked as an engraver in the Daum factory until 1897 when he established his own carpentry workshop and glass studio. His glass, three-layered panels etched with landscapes, was intended for inclusion in items of furniture or trays. He also worked in leather before concentrating on coloured glass panels whose designs were much influenced by Symbolism. From about 1900 he was based mainly in Paris but he never severed his links with Nancy. His glass designs became more geometric with time and in 1925 he produced panels for the French Embassy exhibit at the exhibition.

The last major figure at the Ecole de Nancy was Victor Prouvé (1858–1943) who was a lifelong friend, associate and supporter of Gallé as well as being a man of many parts himself. He studied at the Ecole de Dessin in Nancy and in Paris where he exhibited in the Salon from 1885 to 1900, winning several prizes both there and at the exhibitions of 1889 and 1900. He lived in Paris until 1902, but like Gruber kept in contact with the artistic community in Nancy. Primarily a painter, he was also an accomplished sculptor and engraver as well as a worker in leather and metal and a designer of patterns for lace and embroidery. As a jeweller he specialised in small bronze or gold brooches featuring Art Nouveau subjects cast in relief (medal-jewellery). He provided designs for some of Gallé's marquetry furniture and for some vases. And after Gallé's death, he took over the running of the company between 1904 and 1914. His main contribution was his advocacy of the qualities of the Nancy craftsmen, his tireless work for the training of artists and craftsmen in the city, and finally as director of the Ecole des Beaux-Arts in Nancy from 1919 to 1940.

It was only after the successes of the individual exhibitors at the 1900 exhibition that Gallé succeeded in persuading many of his fellow Lorrainers of the advantages of a more formal grouping. In 1901 "The School of Nancy: Provincial Union of Art Industries" was set up with himself as president and Antonin Daum, Majorelle and Prouvé as vice-presidents. The group resolved to create a professional school of industrial arts, to establish a library, to arrange exhibitions and competitions, organise conferences, publish a bulletin and establish a permanent collection of their work – in short to encourage the development of the decorative arts in Nancy and Lorraine. Exhibitions were held in Paris in 1903 and in Nancy in 1904, the year that Gallé died and Prouvé succeeded as president. However, without Gallé to direct and inspire it, the school soon lost momentum and was dissolved in 1914. Prouvé continued its work through other bodies, but it was not until 1964 that the Musée de l'Ecole de Nancy was opened as a permanent memorial to this remarkable group of designers and craftsmen.

Napoleon III Style. *See* Second Empire Style

Needlework

Needlework, or the surface embellishment of fabric by use of a needle and thread, had its origins in Asia, and many of the ancient techniques are still practised today. Needlework has been used on furnishing textiles since ancient times. Flax for linen has been grown in the Middle East and Egypt since c.6000 BC, and sheep and goats for wool were domesticated c.9000 BC in northern Iraq. Silk has been made in China since c.3000 BC, and Chinese embroidered silks were the source of many ancient designs. Needlework ornamentation on furnishings (wall, bed and window hangings; upholstery; screens) has always been something of a luxury, since in most cases a plain cloth would serve the functional purpose just as well as one that was embellished.

Embroidered fabrics have been found in the tombs of Egyptian kings from as early as 1364 BC (Tutmosis IV). Ancient Egypt produced large quantities of linen for all household purposes including bedding and hangings, and traded with other Mediterranean countries. A large cache of textiles dating from the late 2nd century BC to the 5th century AD found at Tar Caves, in west Iraq on the ancient Silk Road, included many embroidered fabrics used in trade.

In the Altai mountains of southern Siberia felt rugs decorated with appliqué, were found in the Pazyryk burials dating to c.500 BC. Appliqué, in its simplest form, consists of a small

piece of shaped fabric stitched around the edges onto a larger piece. From early times to the present the livestock-herding Turkic and Mongol people of Central Asia have lived in easily movable *yurts*, dome-shaped tents made of heavy felt supported on a wicker framework. The interior of the *yurt* has always been decorated with brightly colored hangings and rugs of appliqué felt or embroidered cloth.

Tents were used by many people in the Middle East and North Africa. Early writers described the finely embroidered interior hangings that lined tents and also served as partitions for the wealthier tent dwellers. When the Mongols and Turks moved into the Middle East, their rulers and nobles adopted the varieties of tent styles already in use by the Persians and others. These included rectangular wall tents, round pavilions, open pavilions in several styles, and large oval tents similar to modern circus tents. They were used for living quarters, military encampments, and pleasure pavilions in gardens. The tents generally had a waterproof outer covering of wool or canvas with an inner wall and ceiling layer of fine silk or linen embellished with embroidery or appliqué in floral designs. Carpets were used as floors. In addition some tents had a rectangular sunshade, or awning, supported on two poles, also covered with embroidery. The luxurious splendor of the needlework on these tent furnishings has no modern equivalent. Persian, Mughul, and Ottoman paintings of the 15th to the 17th centuries show brightly colored tents and awnings in floral patterns similar to Persian carpets and architectural tilework. When the Turks were defeated at the siege of Vienna in 1683 several hundred military tents with appliqué and embroidered linings were appropriated for the use of the victors. In Poland, particularly, the rulers and officers used them for hunting and outdoor festivities, and some were eventually used as wallhangings in great houses. Some of these tents can be seen today on display in the Royal Castle of Wawel in Cracow.

The most significant work of secular European needlework from the medieval period is the Bayeux Tapestry, a wool-embroidered linen wall panel depicting the events of the Norman Conquest of England in 1066. It is believed that the embroidery was worked for Odo, Bishop of Bayeux and half-brother of William the Conqueror, soon after the conquest, but the actual designer and the workers are unknown. It is now housed in the Centre Guillaume le Conquérant in Bayeux, France.

Several German hangings of the 14th century depict stories of lovers, most notably Tristram and Iseult. From the 15th to the 17th centuries large woollen hangings were made in Scandinavia using several needlework techniques, particularly inlaid patchwork, couched embroidery and long-armed cross stitch. Many of the designs, now considered traditional in Scandinavia and Iceland, were derived from Middle Eastern textiles.

The publication of the first needlework design book, Johann Schönsperger's *Furm oder Modelbüchlein* in Augsburg in 1523, and later books from France, Italy, and England spread the Renaissance patterns originally adapted from Eastern fabrics and augmented by fanciful images from ancient Roman wall paintings throughout western Europe. These patterns, added to locally produced designs copied from herbals, bestiaries, and other printed sources, formed the basis

of embroidery design through the 16th century into the Baroque period of the 17th century. After the Portuguese started trading with India in the 16th century, and trading companies in other European countries were established, there was a continuous exchange of pattern styles with Asian countries. Patterns suitable for European taste were executed in oriental style on painted or embroidered fabric that was sold in Europe and copied by local needleworkers. The ultimate expression of this came with the Chinoiserie of the 17th and 18th centuries, wherein a fanciful wonderland of gardens, pavilions, bridges and other subjects in an imagined oriental fashion covered the embroidered and printed fabrics of Europe and North America.

From the 15th century in Europe and later in North America, the most important needlework furnishings were those for the bed. Wealthy households often employed artists and embroiderers who worked with the female members of the household to make matching sets of hangings, valances, and coverlets. Silk embroidery made to imitate expensive woven silk hangings and crewelwork, a wool embroidery in a variety of stitches on a linen ground, predominated until the beginning of the 19th century when Berlin woolwork was introduced.

Canvaswork in wool or silk was used from the 16th century onward for wallhangings, cushions, valances and a variety of covers. Canvaswork, with its tight, flat stitching was more suitable for upholstering furniture than raised crewelwork, particularly on chairs and couches, because it was not as subject to wear. However, large pieces of seating furniture such as the wing chair, introduced in the late 17th century, were showpieces for fine crewelwork.

Berlin woolwork, introduced in Germany in 1804, was characterized by bright colors and naturalistic designs, and dominated domestic needlework on furnishings in the first three-quarters of the 19th century. Floral patterns proliferated, although figurative subjects, often based on famous paintings, were popular in the 1840s and 1850s when the technique was enriched by the addition of beads and new stitches. Such designs were enthusiastically worked on upholstered furniture, as wall pictures, screens and on various smaller items on canvas by huge numbers of middle- and upper-class women in western Europe, North America, Australia and New Zealand. And although some of the finest pieces were undeniably technically extremely skillful, as Berlin woolwork became more widespread the designs became more commercial and the technique coarsened.

The second half of the 19th century saw the introduction of embroidery worked with silks on silk or velvet and the revival of crewelwork worked with wools on linen. Both techniques were encouraged by design reformers including architects such as A.W.N. Pugin and followers of the Arts and Crafts Movement who called for greater honesty in design and a return to simpler and more traditional methods of execution. They were especially popular with skilled amateurs and flourished under the label Art Needlework. Silk embroidery was often applied to table-covers, portières, and the borders of curtains, and particularly fine examples were produced by designers such as May Morris and Candace Wheeler. Crewelwork hangings and bed sets, imitating early 18th century English prototypes, were also favoured in artistic settings. By the end of the 19th century the influence of the

hand-crafted artistic tradition had become sufficiently strong to attract the talents of many designers and was exemplified in the bold and highly individual appliqué work of Anne Macbeth and Jessie Newberry of the Glasgow School. Alongside this tradition, whitework and crazy patchwork also became popular in the later 19th century but none of these techniques was as widely practised as Berlin woolwork.

While wealthy households were producing large hangings and upholstered pieces, people of modest means were establishing needlework traditions of their own. In many rural families in Europe the expense was partially offset by the practice of passing embroidered household linens from one generation to another. Linens were made as dowries by members of a bride's family and added to the inherited stock. In areas where houses had only one or two rooms, the bed was usually the focus of attention, with embroidered curtains for privacy and a large stack of pillows in embroidered cases were displayed on the bed during the day. Some houses had embroidered linens hung on doors and walls. These displays were often the only decoration in the house. Cross-stitch in geometric and floral pattern was favored. Many designs that became traditional in individual villages had fertility or protective symbolism.

In Great Britain and North America quilted bedcovers have been used from the 18th century to the present. A quilt consists of two layers of cotton or wool cloth with a layer of cotton, wool, or polyester batting sandwiched between. The top may be a single piece of cloth (whole cloth), many small patches pieced together or pieces appliquéd one on another. The entire quilt is decoratively stitched through all three layers in order to hold it together. Quilts in the late 20th century have become wallhangings as well as bed covers, and are a medium used by textile artists.

Display of the handwork of individuals in their own homes is the main purpose of domestic needlework in the 20th century. Cushions are popular for needlework of all types because they can be made in any size, and are easily constructed when the needlework is finished. Canvaswork is used on screens and small pieces such as footstools and side chairs. Walls may be decorated with an eclectic mix of framed samplers, appliquéd banners, embroidered bell pulls, and quilts in many styles. Needlework has become completely international, with exchange of designs and techniques among workers in many countries.

Nelson, George 1908–1986

American architect, interior and industrial designer

George Nelson held an important and influential position in American design from the 1930s until shortly before his death. He was trained as an architect, graduating from the Yale University School of Fine Arts in 1931. He was the winner of a Rome Prize that allowed him to study at the American Academy in Rome from 1932 to 1934. On returning to New York when, at the depths of the Great Depression, architectural work was at a standstill, he joined the magazine *Architectural Forum* as a writer and he held a number of editorial positions that made it possible for him to meet the leading architects of the Modern Movement of the 1930s and 1940s. He also became a writer and editor for *Fortune*, a business magazine produced by the same publisher. Through his writing he became a well known and influential theorist for the design professions.

While still contributing to these and other magazines, Nelson accepted a number of architectural commissions, of which the best known was a large town house for Sherman Fairchild on East 65th Street in New York (now demolished). In 1946 he was appointed Design Director for Herman Miller, Inc., a manufacturer in the Grand Rapids area of Michigan. Herman Miller had been a pioneer in introducing modern furniture to Americans in the 1930s when it made and marketed the designs of Gilbert Rohde, an industrial designer who had died during World War II, a period when Herman

Miller had devoted its production to war work. Articles on furniture and on the furniture industry had come to the attention of Herman Miller management who turned to Nelson for the design of a complete new group of post-war products. With this assignment in hand, Nelson established his own design practice with a small office in New York.

The introduction of the 1946 Herman Miller product line (developed by Nelson in collaboration with staff designers Irving Harper and Ernest Farmer) was highly successful and led to a relationship between Nelson and the firm that continued until shortly before his death. In 1946 Nelson's firm became George Nelson and Associates in recognition of the fact that the organization was growing and included a number of designers who worked quite independently under Nelson's general direction. The work of the firm included designs for an increasing roster of clients including the Howard Miller Clock Company for clocks, lamps and varied accessories, Pickard and Walker China for tableware, the Pro-Phy-Lac-Tic Brush Company for Prolon *Florence Ware* plastic dinnerware, General Electric for kitchen appliances and a number of other clients for various products.

In addition to product design assignments, the Nelson office produced graphic and packaging designs for various firms, worked in exhibition design and continued to practise interior design and architecture. A model house for *Holiday* magazine brought clients for residential projects, leading to a partnership with Gordon Chadwick who headed an architectural department within what was to become George Nelson and Company, Inc. as it expanded to more than 70 staff members in the 1960s.

Many furniture designs from the Nelson firm have become well-known "classics" of the Modern Movement including some with such quaint names as the *Marshmallow* sofa, the *Coconut* and *Pretzel* chairs and systems named BSC (Basic Storage Components), EOG (Executive Office Group) and CSS (Comprehensive Storage System). Nelson had a role in introducing the work of Charles Eames and Alexander Girard to Herman Miller and maintained a close relationship with these designers in a way that allowed Herman Miller to take a leading role as one of America's foremost design-oriented corporations.

A highly visible project of 1959 (also involving some collaboration with Eames) was the United States exhibition in Skolneky Park in Moscow. The success of this project led to many other exhibit design assignments, including a large exhibit for the Chrysler Corporation at the New York World's Fair of 1964. Nelson's design of the exhibition *Design since 1945* at the Philadelphia Museum of Art was one of his last projects.

Other Nelson projects included store interiors for Barney's, New York (1969–80), many restaurant interiors such as The Tower Suite (1960) and La Potagerie (1970), both in New York, typewriters for Royal McBee (1962–68) and offices for the Aid Association for Lutherans in Appleton, Wisconsin (1973), incorporating a new system of office workstations produced by the Storwall Company. Although Nelson's personal role in many office projects was limited, he continued to be known as a strong personality in American design circles through his writing, lecturing and teaching. He was a regular participant in the Aspen Design Conference in Aspen, Colorado from its beginnings in 1951. He was the author of a

Nelson: living room, 1958, with *Coconut* chairs and rosewood group furniture

vast number of magazine articles, some of which were collected in the book *Problems of Design* (1957), and his book *How to See* (1977) is a highly personal view of the visual world, largely illustrated with Nelson's own photographs.

Nelson was made a Benjamin Franklin Fellow of the Royal Society of Arts, London in 1960, and a Fellow of the American Institute of Architects in 1963. He and his firm also received innumerable medals and awards for various designs and achievements. Several of the firm's designs are included in the collection of the Museum of Modern Art in New York and in a number of other museums and private collections.

Nelson's lively thinking, ready wit and often combative style made him one of the most interesting personalities of the modern design movement in America from the 1930s to the 1980s.

Biography

Born in Hartford, Connecticut, 29 May 1908. Studied architecture at Yale University, New Haven, Connecticut, 1926–31; attended the Catholic University of America, Washington, DC, 1932; studied at the American Academy in Rome, 1932–34. Married 1) Frances Hollister (divorced); 2) Jacqueline Wilkenson, 1960; 3 sons. Active as a freelance architect and designer, New York, from 1935; in partner-

ship with William Hamby, New York, 1936–41; president, George Nelson Associates, industrial design firm, New York, from 1946; partner, Nelson and Chadwick architects, New York, from 1953. Design Director, Herman Miller Furniture Company, Zeeland, Michigan, 1946–65. Taught design at Yale University, 1931–32, and Columbia University, New York, 1941–44; visiting critic in architecture, Harvard University, Cambridge, Massachusetts, 1972–73; visiting professor, Pratt Institute, Brooklyn, 1975–77. Published numerous books and articles on design. Associate editor, 1935–43, co-managing editor, 1943–44, and consultant, 1944–49, *Architectural Forum*, New York; editor, *Interiors*, New York, 1948–75; editor-in-chief, *Design Journal*, New York, 1968–73. Member, Industrial Designers' Society of America, 1969–76, and committee member, Centre de Creation Industrielle, Paris, 1970. Recipient of numerous prizes and awards including Medal of Honor, American Institute of Architects, 1979, and American Society of Interior Designers Elsie de Wolfe Award, 1975. Fellow, Royal Society of Arts, London, 1960, and American Institute of Architects, 1963; Honorary Royal Designer for Industry, Royal Society of Arts, London, 1973. Died in New York City, 5 March 1986.

Selected Works

Collections of Nelson's furnishings are in the Brooklyn Museum, and the Museum of Modern Art, New York, and in the Musée des Arts Décoratifs, Montreal.

Interiors

1940 Sherman Fairchild House, New York (building and interiors)

- 1946–66 Herman Miller showrooms, Chicago, New York, and Washington, DC (interiors and furniture)
- 1950 Holiday house, Quogue, Long Island, New York (building and interiors)
- 1952 CBS offices, Chicago and Milwaukee (interiors)
- 1954 Information Center, New York Times, Yonkers, New York (building and interiors)
- 1959 US National Exhibition, Skolneky Park, Moscow
- 1959 Loeb Student Center, New York University, La Guardia Place, New York (building and interiors)
- 1962 US Travel Services, Paris, Tokyo, Sydney, Mexico City, London, Frankfurt (offices and interiors)
- 1962–66 Herman Miller Factory, Zeeland, Michigan (building and interiors)
- 1964 Chrysler Exhibit, New York World's Fair
- 1968 Rosenthal Porcelain Studio showrooms, New York (interiors)
- 1969–80 Barney's, New York (showroom interiors)
- 1973 Aid Association for Lutherans, Appleton, Wisconsin (office interiors)

Nelson supplied designs to many manufacturers. His designs for furniture, office and storage-systems were produced by Herman Miller Inc., 1946–80; clocks and lighting by Howard Miller Inc., 1947–80; tableware by Pickard and Walker China; kitchen appliances and electrical goods by General Electric, 1953–62; plastic dinnerware by Proton.

Neo-Baroque

An intense awakening of interest in the Baroque occurred in England in the 1920s which inspired a small but influential number of schemes of interior decoration and was reflected in a wider range of decorative and fine arts.

Although English architects had been reviving the native Baroque since the 1890s, it was not until the 20th century that interest was taken in the previously despised Baroque of Catholic Europe. Geoffrey Scott's influential book *The Architecture of Humanism* (1914) argued for an aesthetic appreciation of the Baroque while repudiating the Ruskinian viewpoint that still underlay English architectural thinking. In the 1920s its argument appealed strongly to those in England who sought an alternative to tired Arts and Crafts ideals and the arid intellectualism of Bloomsbury.

Scott's ideas were formed among the Anglo-American expatriate community around Florence before 1914. As an architect and designer, Scott worked in an Italianate style with his partner Cecil Pinsent for many members of this circle, including Bernard Berenson at I Tatti, Arthur Acton at La Pietra and Sir George Sitwell at Montegufoni. In England he strongly influenced the eclectic architect Clough Williams-Ellis whose chief monument, the Italianate fantasy village of Portmerion, North Wales, begun 1925, was conceived while touring with Scott in North Italy. Williams-Ellis furnished his London house at 22 South Eaton Place in a semi-Baroque manner with fluted gilt-framed looking glasses and crystal chandeliers hung against strongly-coloured marbled walls. His remodelling in the 1930s of Romney's house, Hampstead, London, went further, containing an immense double-height studio with giant pilasters and a Baroque altarpiece described by Hugh Casson (in *Decoration*, June 1935) as resembling "the reception gallery of an 18th-century prelate".

In the public eye, however, the Baroque revival was associated with the highly-publicised activities of the younger Sitwells, Edith, Osbert and Sacheverell. The acquisition in 1909 by their father Sir George of the largely 17th-century castle of Montegufoni in Tuscany fuelled their fascination with the most flamboyant, theatrical and provincial aspects of the Baroque. In 1924 Sacheverell published *Southern Baroque Art* which almost mystically expounded this theme and elevated the Baroque taste to the status of a fashionable cult among the aesthetes of the 1920s.

As self-appointed arbiters of taste, the Sitwell brothers made their London house in Carlyle Square into a showcase for their eclectic and highly personal preferences in art. Following the precept of "unity in diversity", they hung modern works by Eino Severini and the Vorticists Wyndham Lewis and William Roberts alongside lugubrious paintings of the 17th century. The furniture was a theatrical mixture of opulent Regency and Baroque, with an emphasis on 17th- and 18th-century grotto furniture. The dining room contained the most overtly

Baroque ensemble, with marble-topped tables, writing consoles and paintings by Carlo Dolci and Salvator Rosa which hung on iridescent, dark green walls.

The Sitwells' Baroque advocacy rubbed off on their friend Cecil Beaton, who had done much to project their carefully managed personalities through his photographs. In the interiors he created at Ashcombe, Wiltshire in 1930s, Beaton translated the Sitwells' various enthusiasms into a recognisable decorating style, to which he added his own fondness for the silvered Rococo rooms of Southern Germany and fashionable allusions to Surrealism, the nascent Victorian revival and the circus-and-music hall aesthetic of his friend Jean Cocteau. Beaton improvised an extraordinary collection of furniture from a variety of sources, many of the most outrageously "Baroque" items being in fact French Second Empire. Beaton also succumbed to the vogue for all-white rooms begun by Syrie Maugham, who designed a scheme of decoration similar to Beaton's for his friend Stephen Tennant at nearby Wilsford Manor, Wiltshire. In later years Tennant completely transformed this interior with his own, increasingly eccentric, Baroque embellishments. Beaton's and Maugham's work formed the basis for the 1930s commercial neo-Baroque style comprised of heavily gilded and painted furniture of varying dates and quality placed rather sparingly against white or pale walls. A more convincing neo-Baroque was practised by Felix Harbord who developed a grandly theatrical manner based on sound historical knowledge, for instance in his remodelling of Cecil Beaton's post-war house, Reddish Manor at Broadchalke, Wiltshire.

However, the most perfectly realised expressions of the nostalgic, architecturally-minded tastes of this circle were undoubtedly the painted *trompe-l'oeil* interiors of Rex Whistler, notably those at Port Lympne, Kent (1933–34) and Plas Newydd, Anglesey (1936–38). The Axminster carpet designed by Whistler for Edward James in c.1932 was the high point of neo-Baroque applied design.

An equivalent, if grander neo-Baroque taste existed concurrently on the Continent, notably in the work commissioned by Mexican millionaire and patron Carlos de Beisteguy (1863–1953). Tiring of his spartan, Le Corbusier-designed apartment, Beisteguy, with the help of Emilio Terry, introduced large quantities of Baroque and Second Empire furniture and created an amusingly incongruous effect indebted to Surrealism. Similarly, the interiors created slightly later for Helena Rubinstein by Louis Süe illustrated the way in which the Baroque and Victorian revivals were often interestingly combined with Modernism and Surrealism.

In the United States the neo-Baroque style lacked the glamour it had in Europe, since it closely resembled the indigenous Spanish Colonial Revival which, after starting as a millionaire's style at the turn of the century had, by the 1920s, become an ingredient of American suburbia. This seems to be the origin of the somewhat vulgarised version of the style, with its wrought-iron grilles and parchment lampshades, that Osbert Lancaster satirised in its English guise as "Curzon Street Baroque" (*Homes Sweet Homes*, 1939).

Neo-Classicism

Neo-Classicism is a familiar term, yet a difficult one. It is familiar from its use as a general reference to a movement and a style in European art, from the mid-18th century to the early part of the 19th century, that was concerned especially with the idea of classical antiquity. Yet it is also a difficult term, since it serves to identify a possibility of the revival of classicism when, three centuries earlier in the Renaissance, there had already been a revival of the forms of Greek and Roman art. And finally, whatever is meant by this idea of Neo-Classicism, it is used to cover a range of styles, whether in painting, sculpture or architecture, which are remarkably diverse.

The word itself was not contemporary with the style; it appeared first in French in 1861 in a review of a painting by Poussin and in Italian in 1898 in an essay on contemporary poetry by Giosuè Carducci. And still, in German and Spanish, the words *neuklassische* and *neo-classico* are used only sparingly, perhaps because those cultures did not experience an earlier Renaissance classicism against which the new style needed to be defined. Yet for all these problems and difficulties, it is clear that within the art of the 18th and early 19th centuries there was a concern with classicism, clearly defined and clearly articulated as such. And as a response to the excessive styles of Baroque and Rococo art, it had a particular artistic and moral purpose that was different from anything set out for the classicism of the earlier Italian Renaissance.

Neo-Classicism emerged initially in the philosophy of the Enlightenment, with its repeated questionings and calls for an understanding of first principles of thought. Then, after the excavations of Herculaneum and Pompeii which began in the early part of the 18th century, there emerged a far greater mass of classical material from which artists could gain ideas. And the social changes in this period, from the example of Russia with its newly cultured monarch, to the revolutions in America and France, to England and the Industrial Revolution, placed a new set of demands on the arts in an era that historians have described as witnessing the beginnings of a new consumer culture.

It is also important to recognise that the position of art itself was in question. One line of enquiry, most identified with

Neo-Classicism: entrance hall, Syon House, Middlesex, by Robert Adam, 1760s

France, was attempting to think through to the first principles of all the forms of art. But in Britain, coming out of the tradition of David Hume, there was a clearly sustained suggestion that there could not, and should not be any reasoning about art and beauty, which were no more than sentiments, “felt”, as Hume put it “more properly than perceived.” Thus, the word *taste* was often used of responses to art, this notion especially in England becoming as much a measure of social consumption as of artistic judgement. And since there were no more morally justified forms of art, there was what was called the battle of the styles, style depending now on mere prejudice or sentiment – the Greek versus the Italian, the ancient versus the modern – where the choice was between what was taken to be the Greek, the more primitive and thereby the purer and more noble, or the Roman, the more developed and more perfect. Also, Christianity no longer exercised the control it once had. If in earlier times the gods of Greece and Rome had been either condemned by the Christians or then sanctified and allegorised, now in the imagery of painting or sculpture they could be used as symbols of the most profound powers of nature, or as examples of moral virtues, apart from religion, whether private or public.

The philosophical and political contexts for Neo-Classicism are therefore complex. No reckoning of this period should omit the writings of Neo-Classical critics like Anton Mengs, J.J. Winckelmann, Francesco Milizia or the Abbé Laugier, who spoke so clearly about painting, sculpture and architecture.

In terms of particular events, it is possible to say that Neo-Classicism began in 1738 with the discovery of the ruins from the eruption of Vesuvius at Herculaneum and, a little later, those of Pompeii. Classical objects had been uncovered by chance for centuries, most obviously in the Renaissance. But at these new sites there were organised excavations. This led to the uncovering of more objects, and most notably the recovery of classical paintings, which were to have a profound and decisive influence in design and interior decoration, and also gave rise to the more thorough collecting of classical objects and their publication, and a new sense of the idea of the history of classical art. All this was encouraged by the Academies of Europe and by private groups like the Society of Dilettanti in England, who made it a part of the education of cultured gentlemen to visit Italy, and perhaps even beyond to Greece and the Levant. None of this was new. But the scale and variety of all these materials and activities now served different ends, both social and philosophical, that resulted in a difference between this Neo-Classicism and the concern with antiquity in the Renaissance.

It is clear from the polemics of the time and from the arguments of writers such as Mengs and Winckelmann that this new art, whatever the medium, was a response to the excesses of the Baroque and the Rococo. It was also recognised, if less openly, that for all its call to the idea of classical reason, this art could encompass within its possibilities as much of the emotional, the erotic, or the horrifying as its intellectual counterpart, Romanticism. Here it is possible to recognise the sexual possibilities of a figure like Hector, or of Andromache, sheathed in diaphanous, if archaeologically correct clothing. Or the drama and horror of the excavations, with the bodies rediscovered amidst the classical antiquities after centuries of burial in the ash of the volcano. Or the Elgin Marbles, that

were removed from the Parthenon and arrived in England in 1802, where they were recognised both as fragments from the past and thus not to be restored from their damaged condition, and yet also as examples for a new and classically purified art.

The painting of Neo-Classicism is marked by a shared iconography of often newly studied subjects – Andromache, Socrates – and a concern with forms of design and colour, in contrast to those of the Baroque or Rococo, marked by a restricted brushwork, restrained colours and a spatial structuring that, perhaps in the manner of some of the newly uncovered Roman paintings, were set within the borders of the field and held to a tighter order. The great earlier examples were Nicolas Poussin and Raphael. The most famous Neo-Classical painters, most of whom had studied in Rome, were, from Britain and America, Nathaniel Dance, Gavin Hamilton and Benjamin West; from France, Jacques-Louis David, Pierre-Paul Prud'hon and Jean Auguste Dominique Ingres; from Italy, Pompeo Batoni; from Germany, Anton Raphael Mengs and Asmus Carstens.

Neo-Classical sculpture was largely determined by the principles of Winckelmann and his idea of the beauty of Greek art. Like painting, the themes of this art were often classical. And like painting, Neo-Classical sculpture was marked by a simplicity and reasoned purity of forms, plain surfaces, and perhaps a certain coldness in the denying of any of the possibilities of the life and colour that had marked the sculpture of the Baroque and the Rococo. The most famous international names were Antonio Canova and his pupils in Italy; Etienne-Maurice Falconet and the later Clodion and François-Frédéric Lemot and Pierre Cartellier in France who in 1810 installed two decorations in the colonnade of the Louvre. In England, there were John Flaxman, who worked on the designs of vases for Josiah Wedgwood, and Sir Richard Westmacott and Sir Francis Chantrey; in Germany, Johann von Dannecker and Gottfried Schadow; in Denmark, Bertel Thorvaldsen, much influenced by Canova; in Sweden, Johan Tobias Sergel; in Russia, Mikhail Kozlovsky, and in America, William Rush, Hiram Powers and Luigi Persico, born in Italy, who in 1825–28 made the sculptural decoration of the east front of the Capitol in Washington.

But it was in architecture and in interior decoration that Neo-Classicism had its most visible and far-reaching consequences. And certainly in its abstraction, architecture allowed the many disputes about art to be defined very openly. Thus, arguments about the idea of the primitive could now use the evidence of the qualities of the Doric order, pure and simple as it seemed, against the more developed and elaborate Corinthian. Yet architecture is a useful and usable art, and the buildings of this period, like those of all times, were subject to social demands, whether these were the great imperial designs of Catherine II of Russia, or the social requirements of the newly emerging middle classes in England and America.

It was also within the accounts of architecture that a striking change took place in discussions about the propriety of ornament. For if philosophers had now called into question all reasoning about art and about the principles so much of this reasoning was based on, this led them to imagine an idea of design stripped of all that was superfluous or ornamental, a notion that sanctioned the image of the primitive hut as a simple, undecorated structure. By an almost inevitable

paradox, such a way of thinking about the decoration of buildings could lead to the idea of ornament, severed now from any idea of structural necessity, that then could become as rich and free in its effect as the architect or decorator wanted. Thus architecture might now be thought of more openly as a way of making an environment, whether this was to be the grand effects of the royal buildings of Russia, or the more restrained and private decorations in the country houses and estates in America or England.

In practical terms this trend was exemplified in the work of the British architect Robert Adam, arguably the most skilled and celebrated practitioner of the Neo-Classical style, who created wholly integrated interiors, complete with decorations and furnishings that were designed to complement and match the classicising architectural features. Trained first in his family's architectural practice, Adam then embarked on a long period of study in Italy, where he worked under the French painter Charles-Louis Clérissieu whose tuition in painting and archaeology taught him to understand the beauties of classical decoration and how to apply it in contemporary interiors. Using ornament such as griffins, garlands and swags, scrolls and arabesques, urns, vases, paterae and tripods, that were based on ancient artefacts, he also employed influences borrowed from Renaissance artists such as Raphael. Colour was especially important, but it was bright rather than deep, and often included less gilding than before, and he employed major artists such as Angelica Kauffman, Antonio Zucchi and Giambattista Cipriani to paint cartouches, roundels, panels and medallions on ceilings, walls, doors and chimneypieces. Plaster also played a significant role in Adam's interiors, particularly on ceilings, where it was moulded into fluid shapes such as ovals and circles with strong central motifs that often echoed the design of the carpet below. His most celebrated interiors include those at Kedleston in Derbyshire and Syon House, Middlesex.

The most instantly recognisable feature of Neo-Classical design, wherever it appeared, was its decorative motifs, which were based on designs found in Greek and Roman ruins and were used on everything from china to wallpaper. The scroll or volute, and the furled leaves of the acanthus, were employed to embellish columns; animals and birds appeared on furniture, their heads on chair fronts, their feet or claws as legs. Laurel and other leaves were shown in trailing swags or festoons; acanthus foliage was used in plaster bands around cornices, or carved in wood around doors. Military trophies – sculptured groups of weapons, helmets and armour – were applied to symbols of the arts of music, painting and literature in carved and painted decoration. Ceilings, above all, were the architect's canvas and were divided into elaborate panels incorporating numerous classical devices. Chimneypieces, although often lighter and somewhat smaller in size, also exhibited their designer's knowledge of classical design. The ubiquitous inclusion of columns and the classical orders within interiors encouraged the use of different tones and colours to create a harmonious balance of horizontal and vertical elements, with each element of architecture given equal weight: the dado and skirting corresponded to the pedestal, the wall surface to the shaft and capital, and the entablature to the full order. Wallpapers, textiles and upholstery featured antique motifs to match the architecture.

Neo-Classicism was also – whatever the individual differences of regional styles – and for perhaps the first time, an international style, based as it was on ideas about the past and the present that were circulated in books that could reach all parts of the world. And whatever the political differences that existed between the parts of Europe and America, there no longer existed a simple division of faiths that would make this secular art acceptable in one place and not in another.

The first stirrings of Neo-Classicism have been placed by some historians in Britain, in the 1720s, with the neo-Palladianism revived by Lord Burlington (1694–1753) and William Kent (1685–1748), and particularly in the revival of classical architecture and decoration in the building and interiors of Chiswick House (from 1726). But the most obvious place of origin, for all exponents of Neo-Classicism, was in Rome and especially at the Academies there, where so many of the architects, whatever their nationalities, came to study. And it was here, in immediate contact with the public buildings of Rome itself, that a new vision of antiquity emerged, something more concerned with the vastness and scale of the ancient monuments than, as in the past, with the proportion to be seen between architecture and man. Yet national concerns began to emerge quickly. Italian architects of this time, perhaps more than those from the other European countries, were tied to Baroque models and certainly, when it came to the battle of the styles, to the Roman, Italian ideal. Indeed it is often difficult – dates aside – to know from the richness of the forms, however much these depended on the new archaeology, whether the later buildings should be thought of as late Baroque or Neo-Classical. Thus, for example, the work of Luigi Vanvitelli (1700–73) like the Castelluccio Reale, Caserta (1752) or the complex which Giovanni Battista Piranesi (1720–78) built on the Aventine Hill, Rome, for the Knights of Malta (1764–66), or the plan for the Piazza del Popolo (1810–16) by Giuseppe Valadier (1762–1839). Later, in the work done for the Vatican Museums from about 1770 to 1820 by Michelangelo Simonetti (1724–87), Giuseppe Camporese (1763–1822) and Raffaele Stern (1774–1820) there are both designs and buildings that seem more properly Neo-Classical. This is true also for the style for the work done in Milan under royal patronage by Giuseppe Piermarini (1734–1808), the Royal Palace (1779) or the great Teatro alla Scala (1776–78), to which can be added the names of the Venetian architect Giovanni Antonio Selva (1751–1819), known for the Villa Manfrin in Treviso (1783), the Palazzo Dotti Vogodarzere, Padua (1796) and the Teatro La Fenice, Venice (1790–92), and that of his pupil Giuseppe Jappelli (1783–1852), famous for the remarkable Caffè Pedrocchi, Padua (1816–31 and 1842).

It was perhaps in England and France that the richest arguments ranged about the practice of architecture, the French theorists emphasising the principles of building, the English after Hume and then Edmund Burke and his idea of the sublime, emphasising the effects of architecture.

The earliest French architects to work within a recognisably Neo-Classical manner were Alexandre-Théodore Brongniart (1739–1813) and François-Joseph Bélanger (1744–1818), and in Brongniart's design for the Hôtel de Berulle, Paris (1766) or that of Bélanger for the Hôtel de Brancas, Paris (1770) there are clear instances of a restrained, but archaeologically richer style of design. Yet the classicism of the French Baroque had

always been more controlled than that of Italy, and by this reckoning French Neo-Classicism can also be seen as a continuation of a tradition only momentarily broken by the Rococo, encouraged by the arguments of the philosophers and the reports of the archaeologists. Among examples of a perhaps more surely enunciated French Neo-Classicism would be works by Jacques-Germain Soufflot (1713–80): the church of Ste.-Geneviève, Paris, the Panthéon (1764–90), so clearly modelled on the Pantheon in Rome, the rotunda of the Château de Ménars (1768) and the design he did for the Marquis de Marigny (1769) that was a round monopteral Doric temple. By the time the buildings by Claude-Nicolas Ledoux (1736–1806) and the designs of Etienne-Louis Boullée (1728–99) were produced, there had emerged a Neo-Classicism of a very different order. With Ledoux, as at Choux (1775) or in the great toll houses he built around Paris (1784–89), there is a newly simplified, volumetric architecture of cubes, cylinders and pyramids; with Boullée, where the influence of Piranesi's fantasies and the idea of Burke's sublime is more obvious, there is a set of projects, done between about 1775 and 1790, where a massive and almost overpowering abstraction is used, whatever the purpose of the structure, be it a monument to Isaac Newton, the National Library, or a prison. Boullée's designs were too extreme to be executed, but he greatly influenced his pupil J.N.L. Durand (1760–1834), whose lectures on architecture were to be very important. But the influence of Ledoux can be seen in many later works; for example the buildings of Louis-Hippolyte Lebas (1782–1867), the church of Notre-Dame-de Lorette, Paris (1823–26), or the prison La Petite Roquette, Paris (1826–36). The court architects Percier and Fontaine clearly promoted the Neo-Classical style, especially in their interiors at Malmaison and Fontainebleau where they developed the prototype for the Empire style associated with the reign of Napoleon. With the publication of their famous *Recueil de décorations intérieures* in 1801 and 1812, this style was made available to architects and designers far beyond the environs of their native France.

The situation in England was different. The first fully Neo-Classical architect was Robert Adam (1728–92), who trained in Rome and thereafter filled out his work with a wealth of archaeological detail and dramatic effect. At the new Admiralty Building in London (1760) Adam designed a vast columnar screen of the Doric order; and in his plans for Kedleston Hall (1760–c.70) and Syon House, London (c.1761), he suggested a grandeur of scale that was reminiscent of the ancient baths in Rome. Yet his interiors were often very graceful, and at Shardeloes (1761–64) or Kedleston or Osterley Park, London (1761–80) he used extremely rich stucco work, usually of light colours such as lemons, lime greens, pinks and yellows, enclosing elegant paintings, and the whole effect completed with carefully matching furniture. Adam's influence can be seen in the work of Robert Mylne (1734–1811) and George Dance (1741–1825), but these architects also exhibit something of the Neo-Classical sublime, as at Mylne's Tusmore House, Gloucestershire (1766–69) or Dance's remarkable design for the prison at Newgate, London (1769–82), where there are hints of Greek simplicity that echo a similar strain within Neo-Classicism in France.

The interest in Greek architecture was undoubtedly spurred on by the severely classical designs for buildings and interiors

executed by James Stuart, whose painted room at Spencer House contained a remarkable set of antique-style decorations and archaeologically correct furniture. Stuart also published with Nicholas Revett several volumes on Greek antiquities from 1762 onwards which had a strong influence on architects such as Henry Holland (1745–1806) and James Wyatt (1746–1813), especially in Holland's library at Althorp (1780s) and sculpture gallery at Woburn Abbey (1787). The idea of Greek simplicity was continued by Sir John Soane (1753–1837), notably in the Picture Gallery at Dulwich College (1812) and the Dividend Office at the Bank of England (1811–23), and afterwards in the work of Robert Smirke whose British Museum (1823–46) was the home of the Elgin Marbles and had a vast screen of Ionic columns running the width of the front. In furniture and interior decoration, the clear, linear style of Thomas Hope's designs was strongly influenced by Greek prototypes, and his *Household Furniture and Interior Decoration* of 1807 played an important role in disseminating the style within the work of commercial cabinet-makers such as George Smith.

Another strand within English Neo-Classicism was influenced by the Picturesque Movement. This was based on the ideas of Hume, and before him of Thomas Hobbes, of the essentially irrational nature of responses to art, but was often given form in the monuments that came from archaeology, first from Italy as with the temples in the gardens at Chiswick House and Stowe, and then later in buildings from less classical sources at Kew where William Chambers (1723–96) designed Gothic and Moorish temples and a famous Chinese pagoda. The gardens at Chiswick and Stowe were well-known; they were often imitated, most famously in the garden at Stourhead, designed in 1754 by Henry Hoare. But in their final form, in the work of Capability Brown (1716–83) they took on the appearance of what was then called the natural garden at sites like Blenheim Palace (1766) and Claremont, Surrey (1769–70), where the garden ornaments were all dispensed with, leaving only the designed asymmetry of the vistas and the carefully placed lakes and trees and grazing animals, suggesting a new form of beauty, seemingly natural yet based on the same ideas of effect that Hobbes and Hume had referred to earlier.

The English natural type of garden became immensely popular throughout Europe, with examples in France at Beloeil and Méréville, in Italy at the famous 15th-century Villa Poggio a Caiano, and in Germany at the park at Wörlitz, designed between 1769 and 1785 by Friedrich Wilhelm von Erdmannsdorff (1736–1800), who had spent much time in England. But, on the whole, German Neo-Classicism was inclined more to the sparer Greek taste, as shown in the Brandenburg Gate in Berlin (1789–94) by Carl Langhans (1732–1808) and the monument to Frederick II in Berlin (1786) by Hans Christian Genelli (1763–1823) that was made in the form of a Doric temple, crowned in an appropriate archaeological manner with acroteria. Among the next generation, Friedrich Gilly (1772–1800) was especially important. Few of his works have survived, but he was the teacher of Karl Friedrich Schinkel (1781–1841) whose buildings in Berlin presented a model of Neo-Classical architecture and interior design of great intellectual vigour and physical grandeur. The most notable examples are the Altes Museum (begun 1822)

Neo-Classicism: gallery of antique sculpture, Altes Museum, Berlin, by K.F. Schinkel, 1822–30; photographed in 1916

with its great long Ionic colonnade based on the plates in Stuart and Revett, and the Bauakademie (1831). Perhaps the most striking instances of German Neo-Classical design were executed by Leo von Klenze (1784–1864), architect to Jérôme Bonaparte in Kassel and then to King Ludwig I of Bavaria. Most remarkable are the Glyptothek Museum in Munich (1816–31) with its Ionic portico and marbled and polychrome interiors, and the Walhalla, near Regensburg (1830–42), a vast and silent Doric temple, set high up on a hill.

The examples of Neo-Classical architecture and interiors in

other European countries can be briefly listed. In Denmark, the most striking instances are the new classical buildings by C.F. Hansen (1756–1845), such as the Palace of Justice in Copenhagen (1803–06) and the Vor Frue Kirke (1811–20), which has a nave formed by two lines of arches and pillars supporting Doric columns carrying a coffered barrel vault. Another strikingly Neo-Classical building in Copenhagen was the Thorvaldsen Museum (1839–47) by Michael Gottlieb Bindesbøll (1800–56).

In Belgium, Neo-Classicism first appeared in the work of

Laurent Benoit Dewez (1731–1812) who had worked with Vanvitelli in Italy and had travelled to Greece, Syria and Egypt; among his buildings are the Abbey at Gembloux (1762–79) and the Lighthouse at Ostend (1772), erected in the form of an Etruscan column. Later Neo-Classical architects included Claude Fisco (1736–1825), whose Kollege van der Valk, Louvain (1776) was clearly inspired by Ledoux, and Louis Montoyer (1749–1811) who designed the Royal Palace in Laeken.

In Holland one of the first Neo-Classical interiors was the Town Hall at Weesp (1772–76) by Jacob Otten-Husly. Later examples are the Lutheran Round Church in Amsterdam (1826) by Jan de Greef and Tieleman-Frans Suys, and the Haarlemer Poort, Amsterdam by Jan Zocher (1791–1870). To the East, Poland was the most significant country in terms of its Neo-Classical architecture. The Italian Domenico Merlini (1730–97) was especially important; he built a palace in Jablonna (1775) for Prince Poniatowski, and another, the Myslewiec Palace (1775), that had a small reservoir with a water tower directly based upon the tomb of Cecilia Metella in Rome. Also important was Efraim Schröger (or Szreger; 1727–83) who designed the façade of the parish church of Skierniewice (1781) and the Prmyasowski Palace, Warsaw (1784). A notable Neo-Classical building, clearly based on the Pantheon in Rome, is the Evangelical Church, Warsaw (1778–81), designed by Szymon Zug, who also designed palaces in Warsaw in the late 1770s and early 1780s, the Poniatowski, the Malachowski and the Zamoyski. Poland also had many gardens, designed in the English manner, most notably that of Princess Aleksandra Oginska in Aleksandria, near Siedlce (1786) and the celebrated Arkadia (1778) of Princess Helena Radziwill that included many classical buildings such as the Temple by Zug. In the 19th century, the most significant Neo-Classical architect in Poland was the Italian Antoni Corazzi (1792–1877); among his buildings and interiors in Warsaw are the Staszic Palace and the Leszcynski Palace, and he also built a number of offices, including the Finance Ministry and the Bank of Poland that seem to pick up Soane's design for the Bank of England.

Further east, in Russia, the great patron was Catherine II, who encouraged native artists to travel to Rome, and who collected antiquities and supported the study of Neo-Classical masters such as Piranesi and Adam. She summoned the Scots architect Charles Cameron (c.1745–1812) to decorate several of the apartments in the palace at Tsarskoe Selo (1780–84) whose decorative details were based on Adam but whose intense richness of materials and effects also took on much of the splendour of Versailles and German Baroque palaces. Cameron also worked on the estate at Slutsk, near Pavlovsk (1781–96), for the Grand Duke Paul, which he transformed into a complete English park, with classical temples, including a Doric Temple of Friendship whose interiors were variously inspired by the Pantheon, Greek designs and Robert Adam's hall at Kedleston. Cameron's last building in Russia was the Batourin Palace in the Ukraine (1790–1800).

In the early 19th century, a number of Italian architects worked in Russia, among them Giacomo Quarenghi (1744–1817), Vincenzo Brenna (1747–c.1819), and Luigi Rusca (1758–1822). Brenna's Mikhailovsky Castle, St. Petersburg, and Rusca's Barracks of the Cavalry Guards

Regiment, are especially noteworthy. The burning of Moscow in 1812 offered new opportunities for a group of architects working in the native and foreign Neo-Classical styles: V.P. Stasov (1769–1848) and Osip Bove (1784–1834), the Frenchman Auguste Ricard (1786–1858) and the Italian Domenico Gillardi (1785–1845). Important buildings and interiors of this period are Moscow University by Gigliardi, the Old Bolshoi Theatre and the Arch of Triumph by Bove. Stasov was the best known Russian practitioner of the Neo-Classical style and among his most famous designs are the Bell Tower of the church at Gruzino (1815), which recalls Ledoux, the Moscow Gate, St. Petersburg (1833–38), that comes from a design by Quarenghi, and the Church of the Transfiguration (1826–28) and Trinity Cathedral (1828–35), both in the form of a Greek cross surmounted by five domes. The most celebrated architects working in St. Petersburg were Thomas de Thomon (1760–1813), a pupil of Ledoux, famous for the Bourse, and Karl Rossi (1775–1849), born in Russia of Italian parents, who designed the palace at Elagin and the Mikhailovsky Castle.

The classical revival in America began somewhat later than in Europe but, freed as it was from the encumbrances of history, it emerged as a sparer, more ideological style of architecture. The first known classical architects were Samuel McIntire (1757–1811), who took some of his designs, such as those for the Derby House, from Robert Adam; and Charles Bulfinch (1763–1844), who had been educated in France and England and who is known for his design for the Massachusetts State House, Boston and his rebuilding of the Capitol in Washington, DC. But the first great Neo-Classical designer was Thomas Jefferson (1743–1826) who studied building during his term as US minister in Paris. Among Jefferson's most striking and influential works are his home at Monticello, Virginia (1768–82), the Virginia State Capitol in Richmond (1785–99), and the campus of the University of Virginia at Charlottesville (1817–26).

Much of the early 19th century architecture in America was based on an idea of the Greek style, whose spare, pure forms seemed morally and politically appropriate for the new Republican nation. Nicholas Biddle, the Philadelphia gentleman who had travelled in Greece and championed the new Greek revival, was especially significant within this context. The influence of his ideas can be seen in the style of the monuments to Washington by Robert Mills, one in Baltimore (1814–42) and another in Washington (1833); in the Roman Catholic Cathedral, Baltimore, by Benjamin Latrobe; and in Girard College, Philadelphia (1833–48) built by Thomas U. Walter in the Greek style for Biddle, with many refinements coming from the latest archaeological publications. It was Walter who added the domes and wings to the United States Capitol (1850–65), and with this great example, Neo-Classicism became the definitive American style of architecture. Innumerable houses, especially in the South, were erected in the Greek style, and even when new immigrants arrived in California, they adopted Neo-Classical architecture as the most appropriate form for the building of state capitols, museums, libraries and universities.

The legacy of Neo-Classicism is that it is perhaps the style, more than any other, to which modern architects still turn, whether it be to the buildings themselves or to the work of

theorists like Ledoux. Examples of this phenomenon are the careful and deliberately American Neo-Classicism of Allan Greenberg, as in the Athens News Building, Athens, Georgia (1992), and the even grander style of the Harold Washington Library Center, Chicago (1991) by Thomas Beeby, and equally in the interior colours in the manner of Adam developed by Robert Venturi in his work at Princeton University (1983) and the Knoll Showroom (1979). In this sense, Neo-Classicism represents not only a rich architectural and design heritage but also a tradition that is still evolving and vibrantly alive.

Netherlands

Arguably, the very concept of “home” as we know it was invented by the Dutch. From the late 16th century onward, the overwhelming sentiment expressed by members of the bourgeoisie, a class that became dominant in the Netherlands at an historically early period, was that “My home is my ornament, my house is my best costume.” 17th- and 18th-century visitors, like the English ambassador, Sir William Temple (1628–99) recorded with admiring bemusement the largesse the Dutch bestowed on “the Fabric, Adornment and Furniture of their houses.”

For modern observers as well, nothing is more emblematic of the word “interior” than paintings from the Golden Age, when the room with its decorative contents was the consummate setting and subject – an integral part of group portraits and conversation pieces, the silent partner in the narrative of genre pictures, and a beloved theme in its own right. These beguiling works capture typical features of the 17th-century Dutch household: floors of black-and-white marble or earthenware tile; substantial pieces of furniture sparingly placed in expansive spaces illuminated by brilliant light from large windows; a massive fireplace framed by columns of stone or turned wood; tables bedecked with oriental carpets, and mantelpieces and cupboards with blue-and-white porcelain. The walls may be covered with tooled and gilded leather, tapestries, or plaster ornament, but as frequently they present simple white surfaces on which are hung maps or the easel paintings – portraits, still lifes, and biblical, allegorical, or genre scenes – cherished by the Dutch. Other senses, too, are evoked as the viewer glimpses musical instruments and vases of flowers that include specimens of the priceless tulip. Mirroring actual Dutch interiors, these pictorial spaces project an idyll of serene intimacy.

The noted historian Simon Schama has emphasized the home's centrality “in determining the moral fate both of individuals and Dutch society ... [for] the family household in the Netherlands was the ‘fountain and source of authority’” (Schama, 1987). One may speculate that the inhospitable climate, and the necessity for so many of its citizens to travel far and wide to secure their fortune, enhanced the appeal of a domestic haven. “My home is my only luxury. For it I open up my treasure, my coffer; what it demands I must buy,” proclaims a tradesman in a 17th-century play.

The Dutch penchant for dolls' houses (*poppenhuizen*), preserved in a number of museums and private establishments, offers additional evidence of the priority of the domestic, for the popularity of *poppenhuizen* was unrivalled elsewhere. Not so much a child's plaything as a model of a specific or ideal dwelling and an opportunity for the mistress of the house to form a collection of Lilliputian rarities, the doll's house with its intricately fitted miniature rooms gives an astonishingly faithful glimpse of the bourgeois residence. Lovingly wrought to scale are wall hangings, carpets, lamps and chandeliers, toys, utensils, containers and furniture of every type, ceramic stoves and cast-iron ovens. Many of the tiny paintings that adorn the walls are signed by renowned artists, and the silver table pieces proudly displayed are stamped with documented smiths' marks.

In the Netherlands, it was the interior and its contents that

Netherlands: dolls' house (detail) made for Petronella Oortman, Amsterdam, c.1690; oak cabinet veneered with tortoiseshell and tin

confirmed status and taste. Calvinists did not approve of exterior ostentation, and in any case, a long urbanistic convention subordinated the individual house to the overall townscape. Standardization prevailed in the organization of façade, structure, and spatial arrangements, and in such features as the stoop (*stoep*) and the gable. This is not to deny chronological development: in the late 17th century the comfortable parlour / living room (*grote kamer*) is metamorphosed into the formal salon, and the cramped steps (*trap*) of maritime steepness exchanged for a spacious and splendidly decorated stairhall (*trappenhuis*) rising through the full height of the edifice and covered with a skylight. A masterpiece of this genre may be seen in the castle of Middachten in Gelderland. The expansive stairhall, by Steven Vennecool and Jacob Roman (1694–97), is made more impressive still by elaborately carved wooden railings and balconies, and a plastered oval dome and lantern garlanded with putti in high relief.

Until the late 16th century, the area that comprised the northern Netherlands was relatively undeveloped architecturally, defined primarily by scattered settlements of modest wooden houses and a church, perhaps augmented by a weigh-house (*Waag*) and a town and/or guild hall. During the feudal period some imposing castles had been constructed, but knowledge of their interior arrangements is lacking. Furnishings were portable and became dispersed because the lords, their families, and their retainers were constantly in transit from one domicile to another. However, here and there an authentic Gothic piece has surfaced: the oak sideboard (Rijksmuseum, Amsterdam) of c.1525–30, embellished with cunningly worked architectural motifs like tracery and colonettes, that once belonged to the Guild of Civil Guards in Alkmaar, is a fine example of the sturdy yet elegant furniture characteristic of the late Middle Ages.

In any case there could be no Dutch style proper before

Netherlands: painting of an interior by Pieter de Hooch, c.1663-65

1579 when, after the revolt against Spain that broke out in 1568, the Union of Utrecht was formed. This led in 1588 to the Republic of the United Provinces, which received formal recognition of its independence only after eighty years of intermittent fighting. Previously, the localities that constitute modern Netherlands had been ruled by, or were fiefs of, foreign dynasties and kingdoms. From the mid-16th century until 1621 (when hostilities resumed after a 12-year truce with Spain), the strongest influence was from the southern Netherlands (today, Belgium). The printed books of Vredeman de Vries and his followers introduced classical motifs, deformed by grotesque mannerisms, to a region that had not yet absorbed the innovations of the Italian Renaissance. A typical interior of this period is difficult to reconstitute since scarcely any survive

intact, and pictorial representations tend to be more fantastic than authentic. Furthermore, previous to the second quarter of the 17th century, few large pieces are datable although the small precious objects whose provenance is known – salt-cellars, gold and silver ewers and basins, and glass goblets and beakers – are evidence of the high development of the sumptuary arts during this “Dawn of the Golden Age.”

Even after the quarrelsome provinces became united (the original seven were Overijssel and Gelderland in the East, Friesland and Groningen in the North, plus the three most populous, Utrecht and Holland in central Netherlands and Zeeland in the South; today there are eleven, with Limburg, North Brabant and Drenthe added, and Holland divided into North and South), there remained geographical inflections.

Thus each region developed its own type of the ubiquitous tall cupboard (*Kast*) used to store clothing and household goods: these differed according to proportions, the number of doors and subdivisions, and the articulation of the frame, which might be decorated with simple reveals, fluted or floriated pilasters, or engaged or free-standing columns, caryatids and herms. 17th-century furniture in the southerly provinces tends to be more ornate and sculptural than similar pieces found further north. Moreover, one still encounters distinctive folk traditions outside the cosmopolitan centers. Playful painted patterns replace carved ones in the furniture from Hindeloopen in Friesland; just as this province still has its own strong dialect, so Frisian interiors have a character all their own.

Another distinction that must be kept in mind concerns patronage. Until 1815, the United Provinces had no king (except between 1806 and 1813, when Louis Napoleon was on the throne) but customarily paid allegiance to a Stadhouder, a Prince of the House of Orange (although there were a few brief Stadhouder-less periods), but his court, which looked consistently to France for its exemplars and even its designers, was modest in size and influence. Rather, the tone was set by the oligarchy of Regents that governed the powerful cities. These wealthy citizens were more inclusive as to sources and, confident of their own eclectic tastes, created the settings most representative of 17th- and 18th-century Dutch culture.

While one must be circumspect in making generalizations about a country that, for all its limited territorial extent, is incredibly heterogeneous, some characteristic features may be justifiably isolated. There is a preference for solid and stolid items where the tectonic boundaries are respected no matter how heavily decorated the piece. Whether simple or ornate, chairs, chests, tables, and cabinets rest firmly on the floor, visually as well as actually providing stable support; even during the Rococo period, Dutch furniture remains earthbound. Two other prevalent traits at first may seem incompatible: cosmopolitanism and intimacy. The latter derives from a desire for privacy heretofore unprecedented in Europe, and from an aversion to overt worldly spectacle. The former stems from the Dutch Republic's role as a major trading power with extensive international contacts.

Foreign influences abound, not the least from traditional adversaries. Trends from the Southern (Spanish, then Austrian) Netherlands, Great Britain, France, the German-speaking lands, and even Spain, contributed to the evolution of the decorative arts. Since the 16th century, the preternaturally tolerant Dutch have welcomed refugees seeking religious, political, and intellectual freedom as well as economic opportunity. Most were assimilated into the social fabric and, in their turn, enriched the cultural milieu, especially in the area of interior and ornamental design. French *ébénistes*, Huguenot silk-weavers, Jewish printers, English clockmakers, Italian stuccoists and muralists, and Flemish painters, silversmiths, and textile workers were particularly in demand.

There were reciprocities as well. The "auricular" style (composed of zoomorphic forms but taking its name from those based on the human ear), which became internationally fashionable in the first quarter of the 17th century, was conceived by Adam (c.1565–1627) and Paul (c.1570–1613) van Vianen, who stemmed from Utrecht (Paul worked also in Munich, Salzburg, and Prague), and by Johannes Lutma

(1587–1613) of Amsterdam. Cabinet-makers from the United Provinces settled in Paris and had an impact on French design; this was particularly true of marquetry work where the names of Pierre Gole (1620–84), his brothers Gerrit and Adriaan, and his son Corneille, are prominent. After the accession to the British throne in 1688 of the Stadhouder, who ruled as William III with his Stuart wife Mary, furnishings in Britain and the American colonies began to reflect Dutch practice. In formal terms one can frequently, though not infallibly, discover a tendency to emphasize the articulation of the structure; a preference for verticality is also manifest – witness the abundance of tall chests and high-backed chairs with stiffly curved legs.

Moreover, the Dutch gave a unique spin to the influences they absorbed. First, these were purged of pomp and formality, rendered domestic and comfortable for the merchants and financiers who provided patronage. Second, the diversity, even divergence, of the sources was not disguised by the imposition of a spurious unity, and separate artistic traditions often co-existed in the same space. In the 17th century, when Palladian classicism had been assimilated from English and French sources (rather than directly imported from Italy), one could encounter mantelpieces, chests, and door surrounds organized and proportioned according to classical canons side-by-side with furnishings that are glaringly Mannerist or exuberantly Baroque.

One or both of those terms – Mannerist, Baroque – must be invoked to describe the elaborate figured cupboards (*beeldkasten*) popular from c.1625 through the late 17th century. These are literally engulfed by personifications of the seasons and virtues and by reliefs enacting Old Testament stories (those of Susannah, Solomon, Joseph, and Samson were favorites). More paradigmatic, however, are severer pieces where the decoration is architectural and the two- or four-door fronts ornamented exclusively with geometric shapes. In neither case have the joiners stinted on the timber; the wardrobes are substantial and are topped by thick architraves. At the end of the 17th century the cabinet-maker took over from the joiner and his collaborator, the turner or carver; stout, sculpted cupboards gave way to more delicate pieces resting on slender legs and adorned with two-dimensional patterns. One of the most talented marquetry artists was Jan van Mekeren (fl. c.1630–1735) of Amsterdam, whose cabinets and tables were veneered with differently-colored precious woods to create virtuoso floral compositions in *trompe-l'oeil*.

In the Netherlands, oak and walnut were the most commonly-used species but as trade increased and wealth accumulated, more costly and exotic substances, such as ivory, ebony, mahogany, palisander, cherry, coromandel, and pear, satin- and palm-wood were also employed. The Dutch were among the first to experiment with oriental materials like lacquer and mother-of-pearl; after the founding of the Dutch East India Company in 1602, oriental imports became an integral part of the decor. If entire lacquer screens and cabinets were available only to a very few, less affluent consumers could content themselves with locally-produced imitations of Chinese and Japanese furniture, which occasionally might incorporate an actual imported fragment or two.

Dutch ceramic manufacture, first influenced by Italian maiolica, then, more briefly in the mid-18th century, by Saxon and Bavarian china, was most intensely and lastingly indebted

Netherlands: oak cabinet attributed to Jan van Mekeren, Amsterdam, c.1700; oak veneered with palisander, maple, palm, mahogany, walnut and cherry

to Chinese porcelain. No reception room was considered complete without a display of blue-and-white vases imported from, or at least inspired by, the Far East. Eventually ceramic ware of blue or multi-hued patterns on a white ground became synonymous with Dutch production, especially table settings, stoves, and the glazed tiles that protect and embellish walls and fireplace surrounds. Important potteries were located in Delft, Rotterdam and The Hague in Holland, Arnhem in Gelderland, and Makkum in Friesland.

As mentioned above, in the circle of the Stadhouder, French influence was particularly pervasive and one finds palaces and châteaux of almost royal pretention, some designed by Daniel Marot (c.1663–1752) and Jacob van Campen (1595–1657). Yet even the grandest lack the overpowering ostentation of a Versailles or a Fontainebleau. By the turn of the 18th century the Regents, too, looked primarily to France; certainly the various Louis-styles (*Lodewijk-stijlen*) were in vogue throughout bourgeois society. But thanks to the large dimensions of the sash windows (purportedly invented in the Netherlands) – required to provide the interiors of the party-wall structures with sufficient light and air – the proportions have an unmistakably Dutch stamp, as do the materials, details, and workmanship.

Rooms with consistently 17th-century decor are rare because so many interiors were remodelled in the course of the next 100 years. The Schuylenburch mansion (today the German Embassy), on the Lange Vijverberg in The Hague, of 1715–21, presents a Dutch Palladian exterior based on designs by Marot. But Cornelis van Schuylenburch (1683–1763), a gentleman-amateur impelled by a growing passion for the *Gesamtkunstwerk*, commissioned in the middle years of the 18th century decorative paintings and stucco panels and ceilings that reflect the taste of Louis XV's Paris, although the effects are heavier and less seemingly effortless. Especially noteworthy is the craftsmanship of Giovanni Battista Luraghi from Como, one of the first Italian stucco-workers to make his career in the Dutch republic. His lavishly executed plaster surfaces were complemented by ambitious *in situ* paintings from the hands of internationally-minded Dutch and Flemish artists, among them Philip van Dijk (1680–1753), Jan van Gool (1685–1763), Mattheus Terwesten (1670–1757), who trained in Italy, and Jacob de Wit (1695–1754), who did his apprenticeship in Antwerp. Imposing as the huge mythological scenes may be, far more charming are van Gool's overmantel pictures of cattle in a landscape, so unmistakably Dutch in subject, style, and scale.

A comparable residence in Amsterdam, at 672 Keizersgracht, now houses the Van Loon Museum. Designed in 1671 by Adriaan Dortsman (1625/35–82) in his unmistakably laconic classical mode, much of the interior was remodelled during the 18th century and has a Rococo flair. It is furnished with heirlooms and, like many townhouses, has its own garden behind the main structure. The period rooms in another canal house open to the public, the Willett-Holtuysen museum on the Herengracht, include 19th- as well as 18th-century settings. The exhibits in the Amsterdam Historical Museum, located in a converted orphanage, should also be visited for a definitive overview of the evolution of architecture and decoration in the Netherlands' major city.

The Louis XVI/Empire modes were ushered in by Abraham

van der Hart (1747–1820). His elegant interiors, reminiscent of those by Robert Adam and Ange-Jacques Gabriel, may be seen in the former Godin mansion on the Herengracht, used today by the mayor of Amsterdam for official entertaining, and in the Rijksmuseum, where a complete room, c.1790, from the demolished Willem Kops house in Haarlem, is attributed to Hart. The wainscoting of gilded oak in pastel colours, the furniture of painted beechwood and figured silk, and the mantelpiece, chandelier, stucco reliefs, and carpet, were all made specifically for the original owner.

Not surprisingly, Gallic influence continued to hold sway until the mid-19th century. Influenced by revolutionary events in France, the Netherlands in 1795 declared itself the Batavian Republic; subsequently it was incorporated into Napoleon's Empire under the kingship of his brother, Louis. Many Dutch architects were schooled in Paris but the cool, Neo-Classical vocabulary they absorbed there never took hold and was soon overshadowed by a rampantly Romantic and unabashedly extravagant eclecticism in which motifs from 15th- and 16th-century Netherlandish monuments were riotously intermingled. Such historicism, where British associational notions replaced French academicism, also reclaimed national traditions, resulting in the revival of Gothic structure and Northern Renaissance details, and in the suppression of stone and stucco in favor of native brick. Domestic, commercial, and institutional interiors acquired the polychromatic surfaces, pointed arches, and mediocrally-inspired furniture and wall hangings typical of this ebullient and somewhat ostentatious mixture.

Understandably, historians of the decorative arts tend to concentrate on the customs of the most prosperous and sophisticated segments of the population, yet those of less privileged socio-economic backgrounds are not unappreciative of aesthetically pleasing surroundings, a motivation that became increasingly feasible from the late 19th century on. The Industrial Revolution, which touched the dormant Netherlands later than other western European countries, in the 1870s began to produce both a positive and negative impact. On the one hand, members of the working classes were earning greater wages, enabling them to procure more goods, which in turn could be manufactured more cheaply with the help of the machine. On the other, factory-made products, particularly household items, were stigmatized by shoddy workmanship and by the blatant and lifeless imitation of historical forms unsuitable to modern functions. This led to reform movements in the applied arts, based on those in Britain, which now became the *fons et origo* of Dutch design.

At the Great Exhibition, held in London in 1851, the mediocrity of the entries from the Netherlands was noted by one and all. Stung by their poor showing and moved by a rebirth of the capitalistic spirit, the Dutch hastened to compensate, and in 1866 mounted a national exhibition in the Paleis voor Volkslijf (Palace of National Industry), designed by Cornelis Outshoorn (1810–75). Erected 1857–64, the transparent edifice of iron and glass – materials not yet widely employed in the Netherlands – paid homage to the Crystal Palace. Fine and applied arts were displayed together to stimulate effective aesthetic adaptation to new machine methods of production as well as to affirm the importance of quality in hand-crafted items. A succession of such expositions was held throughout the country to upgrade the attractiveness and utility of Dutch

products and make them more competitive at home and abroad. These exhibitions coincided with the founding of the first Dutch schools to train decorative artists and craftspersons and with the formation of societies to improve conditions in the various trades and professions.

In accord with French directives, the guilds had been abolished in 1795, necessitating new organizations that could deal with monetary, educational, and work-related questions. "The Society for the Advancement of Architecture" (*Maatschappij voor de Bevordering van de Bouwkunst*), founded in 1841, included builders, interior designers and artists as well as architects; it was followed in 1855 by the more exclusive and theoretically-oriented club called *Architecture et Amicitia*. Dedicated to raising the deplorable standard of two- and three-dimensional design, these groups exhibited, and published in house organs, the work of members, and held debates about stylistic and ethical issues. They introduced competitions that were not confined to public buildings but encompassed middle-class and eventually workers' dwellings. Some painters' societies, such as *Pulchri Studio* and *Sint Lucas*, established in 1847 and 1880, respectively, also admitted craftspersons but often solely as non-voting members. Such umbrella organizations fragmented when decorative and applied artists and industrial designers, sometimes together with manufacturers, left to form their own discrete unions. *Arti et Industriae* appeared in 1884 and *VANK* (*Nederlandsche Vereeniging van Ambachts- en Nijverheidskunst* – Netherlands Association for Crafts and Industrial Arts) prospered from 1904 until 1941.

Public institutions began systematically to collect examples of applied arts from various historical periods and to purchase prize-winning entries at the expositions. In Haarlem, the Museum of Industrial Art opened in 1877; in Amsterdam, the *Stedelijk* (City) Museum, dedicated to contemporary art, commenced operations in 1895 and became a leading venue for temporary displays, organized by the fledgling Arts and Crafts organizations, where the public could buy the work on view. A notable show was mounted in 1905 by the group *Kunst aan het Volk* (Art for the People), which was intended to "demonstrate the ugliness of our contemporary environment and the things in daily use." "Good" and "bad" examples of furnished workers' flats were exhibited; from now on, the proletariat as well as the middle classes were the target of design uplift.

Thanks to these activities, in the 1890s the Dutch regained their place in the field of interior design and have not relinquished it since. Indeed, 20th-century achievements may surpass in originality those of the Golden Age, when the Dutch component consisted chiefly in the assimilation, synthesis, adaptation and harmonizing of trends that had their sources elsewhere. Since the turn of the century, the Netherlands has made strikingly resonant contributions that have been emulated, when not directly imitated, throughout the world.

This point may be illustrated by turning to the *fin de siècle* itself, when two modern currents vied for supremacy, each related to the international Art Nouveau. In both cases the designers shared an anti-historicism counterbalanced by direct inspiration from nature, introduced motifs and techniques (batik, for one) from the Dutch East Indies, particularly Java, and made extensive and novel use of glazed tiles. Nevertheless in their motivations and formal language they diverged

markedly. The exponents of the more derivative and ephemeral variant reproduced the intricate curvilinear rhythms and Symbolist iconography associated with Brussels, Nancy, Paris, and Munich, and were in close touch with such groups as *Les XX* (Vingt) in Belgium (subsequently known as the *Libre Esthétique*). The painters / decorative artists Jan Toorop (1858–1928) and Johan Thorn Prikker (1868–1932), creator in 1898 of the Arts and Crafts Shop in The Hague, and the architects / interior designers T.K.L. Sluyterman (1863–1931) and H.P. Mutters (1884–1954), jointly responsible for the Dutch Pavilion at the Paris Exposition of 1900, are representative of this branch, derisively dubbed by its detractors, who considered it decadent, the *zeewier* (seaweed) or *krullemie* (spaghetti) style.

The more dominant and prescient wing was *Nieuwe Kunst* (New Art), which bequeathed its tenets to groups arising during and after World War I (the Dutch were neutral and thus able to continue their own development during those cataclysmic years) and established principles still followed today. To some extent New Art might be classified with such concurrent rectilinear permutations of Art Nouveau as the Glasgow School and the Vienna Secession – all three movements emphasized the right-angle when constructing furniture and decorative patterns – but the *Nieuwe Kunst* interiors were shaped to an unprecedented and provocative degree by a geometric system that governed the proportions and arrangement of everything in the room. Moreover, all the furnishings exhibit the restraint, abstraction, structural integrity, and respect for the natural properties of materials characteristic of Dutch practice.

In the Netherlands, the geometric basis for design had a deep, almost religious, significance intended to bring about universal understanding and equilibrium. In contrast to the individualism and sensuality of most Art Nouveau production, *Nieuwe Kunst* proposed the ideal of a spiritually elevated, socially relevant, and harmonious environment created co-operatively by the various members of the arts and crafts community. The belief that the applied arts could foster a better life – ethically as well as materially – went back to English theories, which indubitably provided the most potent intellectual background to *Nieuwe Kunst*. But the mystical fervour that sustained its practitioners and the thoroughness and rapidity with which New Art spread to every corner of the Dutch design world was unique.

Among the most convincing advocates for *Nieuwe Kunst* were J.L.M. Lauweriks (1864–1932) and K.P.C. de Bazel (1868–1923). With H.P. Berlage they shared an admiration for the clarity, simplicity, solidity, and straightforward constructional honesty of Egyptian, Assyrian, and medieval artefacts. After converting to Theosophy, a religious-philosophical movement that proved unusually popular among artists and architects in the Netherlands, in 1895 they inaugurated in Amsterdam their *Atelier voor Architectuur, Kunstnijverheid en Decoratieve Kunst* (Studio for Architecture and Applied and Decorative Arts) and from 1898–1900 published the exquisite periodical, *Bouw- en Sierkunst* (Architecture and Ornamental Art). They had been initiated into their calling in P.J.H. Cuypers's office, which proved to be a veritable incubator for leaders of *Nieuwe Kunst*. Nurtured there were C.A. Lion Cachet (1864–1945), G.W. Dijsselhof (1866–1924), and

Netherlands: interior by G.W. Dijsselhof, c. 1896

Theodorus Willem Nieuwenhuis (1866–1951). Interiors by these outstanding representatives of New Art have been installed in the Gemeente Museum in The Hague (1896), the Centraal Museum in Utrecht (c.1910) and the Rijksmuseum in Amsterdam (c.1910), respectively; they offer superb examples of New Art furnishings and settings executed in wood, batik, pottery, tile, copper, and brass. Nor should it be overlooked that during this period the boundaries between “fine” and applied arts were being dramatically dissolved. Sculptors and painters eagerly accepted decorative commissions for public and private buildings and the work of ornamental artists was increasingly prized.

Lauweriks and De Bazel were soon joined by others seeking to propagate radical advances in interior design by founding workshops and stores. Of primary significance was ‘t Binnenhuis in Amsterdam, which in the decade from 1900 to 1910 purveyed the pioneering artefacts of Berlage, Jac. van den Bosch (1868–1948), W. Penaat (1875–1957), and J. Eisenloeffel (1876–1957). In 1904, Eduard Cuyper (1859–1927; nephew of the great P.J.H.) decided to devote an entire section of his architectural studio to interior design. He called this atelier *Het Huis* (The House), and from 1903

published a monthly magazine of the same name exclusively devoted to domestic architecture and decoration (from 1905 it was titled *Het Huis oud en nieuw*).

That the strength of New Art lay in its theoretical underpinnings more than in any strictly formal experiments, except for the geometric systems employed, is demonstrated by its impact on both the Amsterdam School and De Stijl. Stylistically inimical, each group nevertheless was profoundly aware of indigenous archetypes and drew sustenance from the principles of *Nieuwe Kunst*, whether dealing with typography, glass, textiles, ceramics, metal, wood, or the entire architectural task. Another pair of rival movements, which emerged in 1925 and reigned until World War II, comprised the Dutch versions of Art Deco and Functionalism (*Nieuwe Bouwen* – New Building), and were indebted to New Art while being more closely linked to international currents. Associated with the latter are the architects J.J.P. Oud (1890–1963), Johannes Duiker (1890–1935), and Mart Stam (1899–1986), and the designers Piet Zwart (1885–1931) and Cor Alons (1892–1967); all enlarged the palette of materials by adding modern metals like chromium and tubular steel while simultaneously restricting the formal vocabulary by eschewing

ornament. Hendrik Wouda (1885–1947), Paul Bromberg (1893–1949), and Sybold van Ravesteijn (1889–1983) drew on the best features of both camps. More ingratiating and acquiescent to demands for comfort and cosiness than the uncompromising Functionalists, they nevertheless responded to the national preference for sobriety and purity, so that one will not encounter in their interiors the indulgent lavishness of the quintessential Art Deco milieu.

From 1913, the firm of Metz & Co. (founded as a drapers shop in the 1740s) became a major vendor, and to some extent manufacturer, of avant-garde furnishings; the Dutch agent for Liberty of London, Metz offered work by the figures cited in the previous paragraph. Philips & Co., which originally operated a light-bulb factory, also merits a place in the history of the interior. Through its well-made electrical appliances, most notably radios, Philips brought modern design within reach of the average family abroad as well as in the Netherlands. Another contributor to the dissemination of innovative trends in interior design, through architectural commissions, product display, and temporary exhibitions, is the department store chain, De Bijenkorf (Beehive), with premises in major cities. In 1952, under the leadership of the interior architect, Benno Premsele (b. 1920), De Bijenkorf put its shop windows and retail floors at the service of painters and architects as well as designers, encouraging them to apply their artistic vision to objects used in daily life.

Deserving of mention, too, is the Jaarbeurs (Industries Fair), which has played a growing role in design since 1917. A sequel to the international exposition, the Industries Fair initially was more purely commercial in orientation but gradually many of the objects for the home that were shown there attained a progressive cachet and were made generally available. A further contribution of the Jaarbeurs was the introduction of a desirable new field of interior design – the composition of display stands, which encapsulate at small scale, and may subsequently influence, exterior and interior architecture.

The government no less than private enterprise has been actively concerned with aesthetically and functionally exemplary design. J.F. van Royen (1878–1942), a fervent supporter of Arts and Crafts ideals and a one-time chairman of VANK, was determined to place the PTT (Royal Postal and Telecommunications Service) in the vanguard of the most promising trends. Joining the agency in 1919, he experimented with the gamut of current styles, from the quasi-Expressionism (see Amsterdam School) of the unique interiors by Joseph Crouwel (1885–1962) for the central PTT offices in Utrecht (1918–23) and Haarlem (1920), to the sleek Functionalism of the telephone kiosks, still in use, designed in 1930 by L.C. van der Vlugt (1894–1936), one of the most poetic representatives of the Nieuwe Bouwen. Commissions from state and municipal bodies continue to attest to official commitment to high-quality design in public ventures.

A peculiarly Dutch phenomenon especially relevant to our topic is the ubiquity of the houseboat. While houseboats may not be unique to the Netherlands, the number of people who dwell on them there is relatively high owing to the severity of the housing shortage on the one hand (Netherlands is the most densely populated country in Europe), and the abundance of waterways on the other. The *Zwerver* is one of the first purpose-built houseboats; usually moored on the River Vecht,

it was constructed by Wijnand Nieuwenkamp from 1898 to 1902 and luxuriously adorned with Delft tiles and carved panels of teak, olivewood and cedar. But working barges and pleasure craft have just as often provided the raw material for a floating residence, and extreme ingenuity has been exercised to provide a homey atmosphere. The insertion of novel functions into envelopes built for other purposes partakes of a venerable Dutch tradition; when the Calvinists took control of the United Provinces, for example, monasteries and convents were converted to secular uses through renovation of existing spaces, an operation compatible with the Dutch need to maximize scarce existing resources. Today warehouses, factories, and windmills have been recycled into new dwellings, while former canal houses now shelter offices, cafes, and shops, a challenge met with dazzling originality. Some interiors have been resurrected with gleaming High-Tech details, others transformed with witty allusions to historical precedent, although Postmodernism *per se* has not found favour in the Netherlands.

It is instead Modernism – but a lyrical rendition captured through the lens of the Nieuwe Bouwen – that moves members of the middle and younger generations, like Hans Tupker (b. 1938?), Rem Koolhaas (b. 1944), Koen van Velsen (b. 1952) and Wiel Arets (b. 1955). This is a “modernism without dogma,” freely reinterpreted and untrammelled by preconceptions in a way abidingly Dutch. Although one can point to a few episodes of self-righteous rigidity, more typically, sincere concern for the well-being and joy of the inhabitant, and respect for the capacities and vision of the designer, have tempered Functionalist orthodoxy.

Doctrinaire Functionalism has been most fundamentally and imaginatively resisted by the liberating theories of Aldo van Eyck (b. 1918) who, a leader among post-World War II Modernists, nevertheless has been faithful to the long-standing intuition that the “inside” is an indispensable ingredient of Dutch culture. According to van Eyck, “it is not space that counts ultimately but the interior of space and, above all, the inner horizon of that interior, whether it be inside or outside.” As evidence, he invokes the paintings of Pieter de Hooch.

Van Eyck and former students like Herman Hertzberger (b. 1932), profoundly troubled by the impersonality and amorphousness of the contemporary environment, have made it their aim to restore the intimacy and reassurance of the domestic hearth to the urban place while infusing the interior with those opportunities for enriching encounters conferred by the town. This strategy is especially productive in relation to institutional and commercial structures, which in the late 20th century have assumed the aura of surrogate dwellings. Hertzberger’s Centraal Beheer (1967–72) headquarters in Apeldoorn in eastern Netherlands, for 1,000 office staff, and van Eyck’s extensive European Space Research and Technology Center (1983–90) in Noordwijk near Leyden, embody the architects’ humane goals. Some interiors are organized like streets and piazzas, outfitted with room-sized street lamps and benches, to multiply the possibilities of interaction and vary the pace of circulation; others are configured to allow the occupants either solitude or an almost familial relationship with co-workers.

Van Eyck’s favorite expression, “labyrinthine clarity,” tantalizingly suggests the subtle difficulties of his self-

proclaimed mission to affirm spatial order and certainty without sacrificing experiential complexity. In his Hubertushuis on the Plantage Middenlaan in Amsterdam (1973–78), a philanthropically-operated home for single mothers and their children, van Eyck has forged analogies between the town and the domicile through structured passageways and built-in furniture dimensioned according to the age of the user. The composition is extremely sensitive to the overall context, for besides new construction the brief required the conversion of two contiguous buildings. An unexpected, but henceforth permanent aspect of his work is the exploitation of the full spectrum of color; van Eyck has forsworn the exclusively primary palette demanded by De Stijl for a scintillating rainbow of hues.

Van Eyck's oracular statement, "Architecture need do no more, nor should it ever do less, than assist man's homecoming," brings us full circle in understanding the pervasive importance for the Dutch of the interior, particularly in the domestic sphere. In scarcely more than four centuries of existence this small nation has powerfully enhanced the potentialities for comfort, convenience, richness of meaning, and purity of form (*Schoon*, the Dutch word for "beautiful" also means "clean") in the rooms we inhabit. If the dawn, zenith and twilight of the Golden Age celebrated a pinnacle in architecture and the applied arts, the period that began in the 1890s – and flourishes still – surely marks another summit.

Neufforge, Jean-François 1714–1791

French architect and engraver

A contemporary of Jean-Charles Delafosse, Jean-François Neufforge is chiefly remembered for his monumental work, the *Recueil Élémentaire d'Architecture*, which he published in eight volumes with 906 plates from 1757–80, and as an influential propagandist of the severe Greek or Neo-Classical style. He was born at Comblain-au-Pont near Liège, and then moved to Paris where he found work as an engraver. His first published work, *Nouveau livre de plusieurs projets d'autels et de baldaquins*, dates from 1747 and was engraved by Babel, and contained altars and canopies in the Rococo style. During this period he is said to have studied under the architect J.-F. Blondel who was one of the earliest and most outspoken opponents of the Rococo and whose attack on the increasing extravagances of the style appeared in his first published work *De la distribution des maisons de Plaisance*. Further criticisms appeared in Blondel's subsequent publications including his contributions to Diderot's *Encyclopédie* and his *Architecture Française*, a four-volume work on French architecture issued 1752–56. Blondel also founded an independent school of architecture in 1740 and in 1762 he was made a professor at the French Academy, by which time his ideas had become more widely accepted and criticism of the Rococo style had reached its peak not just in architecture but also in painting. The fact that Neufforge is thought to have studied under the defender of a Classical French architectural style probably significantly

influenced his own later designs which drew widely on the heavy Baroque forms of the 17th century.

The first manifestations of a Neo-Classical style began to emerge in Paris in the early 1750s. Classicism itself had never been fully abandoned, and it had long been accepted as the most appropriate style for buildings that required sober formality. Within this context it was popular for civic buildings, and also sometimes as a decorative scheme within dining rooms where formal effects were preferred. During the 1750s, however, it became more widely accepted, as tastes slowly began to change in response to the assault on the Rococo that had gathered force in the previous decade.

The early phase of this new classicism was known as the *Goût Grec*. The first interior to be called Neo-Classical was a design by Louis-Joseph Le Lorrain in 1754 for the dining room in the castle of Åkerö in Sweden. Incorporated into the design was an order of columns and a straight entablature, making it much more austere in its effect than previous styles. Le Lorrain also designed furniture for a room in the house of a rich dilettante, Ange-Laurent La Live de Jully, in 1757. A portrait of La Live from 1757 by Greuze shows some parts of the furniture which featured rectangular shapes – especially visible in the chair on which he is sitting – and decorative motifs such as rosettes which were more characteristic of the decorations found on buildings rather than furniture. According to La Live himself, the *Goût Grec* soon began to be employed not only for furniture but also for jewellery, hairstyles and decorative wares.

Neufforge's work can only be understood within the context of the development of this advanced Greek style, and its influence is clearly reflected in the engravings illustrated in the *Recueil*. He stated that his aim was to emulate "the masculine, simple, and majestic manner of the ancient architects of Greece, and of the best modern architects", and his style is often heavy and quite geometric. It is interesting to note that the *Recueil* was originally to be entitled *Livre d'Architecture contenant différents desseins la Décoration intérieure*. In this sense it was clearly intended for interior decoration rather than architecture and provided a wide selection of motifs for those interested in the new style. It contained many examples of buildings in different sizes to suit both very rich and less wealthy clients, and its range was much wider than that of traditional pattern books. The *Recueil* also includes engravings of patterned mouldings that could be used by bronze-makers who were eager to respond immediately to the new initiatives of architects. The styles of the buildings in Neufforge's *Recueil* are based on a range of ideas that were comparatively advanced at the time, especially the use of free-standing columns and 16th-century decorative motifs. Many of the villas are also reminiscent of the Palladian style which was very popular in the second half of the 18th century. Some of the more innovative ideas in style and decoration are the use of stone balustrades instead of iron railings beneath the windows and the framing of the central loggia by two giant free-standing columns. Neufforge's work was very important in the development of 18th-century classicism and it shows a clear tendency to hark back to the Italianate villas of the 16th century as well as a return to the heavy style of 17th-century Baroque – a notion that had been especially advocated by

Blondel – the period which was generally accepted as representing the Golden Age of French architecture.

The *Recueil* volumes are divided into themes: Volume I from 1757 includes wall decorations, alcoves, beds, tables and vases; volume IV (1761) chimneypieces, guilloches and Greek frets as well as some schemes for rooms; volume V (1763) iron gates, balconies and stoves, marquetry, furniture and frames, vases and plinths; volume VI (1765) church furniture including altars, pulpits, organs, choir-stalls; and volume VIII (1768) interiors with a wide range of furniture, frames, mouldings, doors and floors. The later volumes also included prisons and lighthouses, the former being part of the growing interest in the building style for punitive establishments, as exemplified by the designs of Boullée and Ledoux.

Neufforge had been instrumental in developing an uncompromising, even brutal form of classicism. The *Recueil* was highly praised by the Academy and received its official approval. Few of his designs were actually executed, but, nevertheless, his work represents the most well-known and comprehensive compendium of designs in the advanced *Goût Grec* style.

UTE KREBS

Biography

Born in Comblain-au-Pont, near Liège, 1 April 1714. Arrived in Paris c.1738. Studied engraving with Pierre Edmé Babel and architecture with Jacques-François Blondel. Active as a designer and engraver of architecture, ornament, and furnishings from the late 1750s; published his major work, the *Recueil*, 1757–68 and 1772–80. Died in Paris, 19 December 1791.

Neumann, Balthasar 1687–1753

German architect

Of all the great German architects working in the first half of the 18th century, it is Balthasar Neumann who is regarded as epitomising the late Baroque style as it began to be supplanted by the Rococo. He absorbed elements from contemporary Italian, French, and Bohemian architecture, which he fused with his own artistic and constructive concepts of space to create a highly personal style, and his work enjoyed great fame even during his lifetime. Neumann owed the breadth of his influence – which extended beyond the borders of Main-Franconia into the Cologne area – to the power of his principal patrons, the high dignitaries of the church of Schönborn, whom he served as the Würzburg Prince-Bishop's master builder.

Born in Bohemia in 1687, the son of a clothmaker, Neumann was apprenticed as a foundryman specialising in bells and cannon before studying the theory of civil and military architecture in Würzburg. Perhaps because of this technical training, older research (Keller, 1896 and Sedlmaier & Pfister, 1923) has denied Neumann any artistic ambitions and reduced his role to that of a designer and organizer. More recent research (Reuther and Hotz), however, has revised this view and has universally acknowledged Neumann's formal abilities, particularly in the field of interior decoration and furnishing. Even so, determining the extent of Neumann's authorship of the interior design of his buildings is not straightforward. But if the question is approached from the theory of the Baroque synthesis of the arts, one can assume that Neumann not only took the architectural form into account in his plans, but also closely considered the form and style of the decoration. Indeed, for Neumann, the decoration was a criterion by which every completed building would be judged, and he employed an experienced team of stuccoists, sculptors and painters, including Johann Michael Fischer, Wolfgang van der Auvera, and Johannes Selz, for the execution of this work. The development of Neumann's own ideas on decorative details can be seen in his "Sketch-book" – a collection of some 500 sketches for designs – wall and ceiling stuccoes, details of furnishings, sculptures and furniture – drawn by different artists, and kept by Neumann as a sort of pattern book which he added to continuously. And Neumann's own architectural drawings, as well as showing the normal details of the ordering of walls, the positioning of columns and the arrangement of vaults and arches, also provide detailed instructions for stucco work, ceiling frescoes and items of furnishing, as can be seen in a copperplate engraving from 1745 which shows a central perspective view of the court chapel of the royal seat in Würzburg.

Neumann's interest in proportions and dimensional relations is confirmed by the set of dividers which he developed for his own use in 1713; these enabled him to calculate the respective diameter of differing orders of columns placed on floor spaces of a uniform height. Neumann was also active in the sphere of the crafts. In 1737, for example, he leased a glass-works in Schleibach where windows and mirrors were produced not only for his own buildings (primarily for the

court in Würzburg), but also for export to Holland and England.

With regard to the interior form of Neumann's buildings, one should distinguish between pure decoration and furnishing and the tectonic elements that characterise the interior, including the ground plan conception, the ordering of walls, the positioning of columns, window openings (the direction of light) and vault forms. Neumann experimented above all with the multi-layering of walls and the arrangement of vaults, achieving in this way a great breadth of variations on different concepts of space. He designed interiors for both secular and sacred buildings, and along with his outstanding castles (the Würzburg Residenz, Werneck, Schönbornslust), churches (Münsterschwarzbach, Vierzehnheiligen, Neresheim) and chapels (Schönborn Chapel, "Käppele" in Würzburg), his designs for residential buildings (Würzburg, Kapuzinerstrasse), commercial buildings (Würzburg, Kaufhaus am Markt) and fortifications (Würzburg, Maschikuli Tower) should also be taken into account although, in keeping with their function, they tend to be far simpler in form. In general, however, the late Baroque characteristic of a discrepancy between the strict, simple exterior and the decorative richness and colourfulness of the interior holds true for Neumann's architecture. Neumann's principal innovations were in the fields of monumental palace staircase designs (Würzburg Residenz, Brühl, Bruchsal) and of sacred architecture.

The domed rotunda, the figure of a circular or oval cylinder with a vaulted cupola, represents the central, leading motif in Neumann's sacred interiors. This feature appears at the centre of the building and influences the design of the adjoining units of space, which mostly also have round or oval ground plans. This bringing together of spatial features with their independent vaults into a unified space leads to the impression of a curved interior. The first church building in which Neumann employed this rotunda motif was the Schönborn Chapel of Würzburg Cathedral (1721–24, 1729–36). The ground plan shows a circular central room which is flanked by two oval-shaped side rooms. The pendentives of the middle cupola are situated not on the outer closed walls, but rather on four double columns arranged in front of the walls, so that the cupola rises up out of the interior's double-shelled rotunda, expands upwards and, with the curved lateral triumphal arches, incorporates the vaults of the adjoining rooms. The coloured regalia in this "triptych" are treated in blue-grey, black and reddish marble; all of the decorative elements, such as capitals, entablature consoles, cartouches and festoons, are highlighted with gilt. Even the pattern of the floor covering in the Schönborn Chapel refers to the arrangement of the three divisions of space; a drawing from Neumann's building bureau records each individual floor tile with its colour.

While the middle rotunda functions as the central room in Holzkirchen (1728–30), the castle chapel at Werneck (1733–44) and the Würzburg "Käppele" (1748/49), in Münsterschwarzbach (1744–49) and Langheim (1742) Neumann employed it as the element which defined the crossing in these long cruciform buildings. The impression made by the curved interiors is greatly diminished in these buildings by their strict, right-angled ground plans and their traditional pilaster church features. In both of his outstanding late sacred buildings, Vierzehnheiligen (from 1743) and Neresheim (from

Neumann: staircase hall, Schloss Augustusburg, Brühl, 1740–48

1747), Neumann succeeds in filling out a classical church ground plan with several internal, free-standing rotunda spaces, and he ensures a fusion of the individual sections of space with wall openings, such as archways and galleries, and also with the unified decoration of pillars and vaults. The decoration of Neumann's sacred interiors is rich and magnificent, but not cluttered; in spite of *rocaille* stucco works, sculptures, built-in altars and frescoed vaults, the construction of the architectural elements remains visible. The interior's airy, vibrant atmosphere is fostered by the way in which Neumann

manipulates the direction of light, which reaches its apotheosis in the West Building of Neresheim – not least because this section incorporates the areas where music is made.

Neumann himself designed several high altars for churches. The form of altar that he favoured was the choir ciborium. Even here the architectonic element predominated: the actual altar is covered by a baldachin supported by pillars. In this way the high altar does not have the effect of a wall placed in the choir, but rather of a filigreed superstructure. With the High Altar of Brühl Castle's church (1745), whose figural

programme was created by Johann Wolfgang van der Auvera, the baldachin is also broken up by *rocaille*-embellished girders that turn into volutes. As a special case, Neumann had a mirrored window opening built into the back wall of the altar in Brühl, which leads to the Prince-Bishop's oratory and behind which his patron, the Cologne archbishop Clemens August of Bavaria, could take part in the worship unseen.

As his career developed, Neumann turned his attention increasingly to the formal space inside the *corps de logis* of a castle, namely the stairwell, where he created some of his most unique interior designs. The castle stairway was regarded in the 18th century as the most important focus of the reception ceremonial, and accordingly it had to be generously appointed and furnished with a rich decorative programme. Starting out from the model of the great stairway in the Weissenstein Palace by Lukas von Hildebrandt (completed in 1718), Neumann designed monumental examples of stairway architecture in Bruchsal (1731), Brühl (1740, 1750, 1761) and the Würzburg Residenz (1720–44). Neumann's stairways stand out because of their spaciousness and an element of "heightening" in the furnishing, which is intended to accentuate the idea of "ascent" as an analogy of the stairway's function. In Schloss Augustusburg in Brühl, a short flight of steps leads the visitor from the darkly marbled vestibule with caryatids that appear to support the entire stairway, up to the landing, above which there rises the monument to Prince Clemens August on the wall. Two flights of steps opposite each other then take one further, into the gallery, whose walls are lined with a brighter stuccoed marble; the whole stairwell culminates in a brightly lit false cupola, which was provided with an illusionistically-painted fresco of the heavens by Carlo Carlone. In the conception of these complex architectural features, Neumann proved his talent for interior design and the arrangement of a unified decorative programme.

STEFANIE LIEB

Biography

Johann Balthasar Neumann. Born in Bohemia, January 1687. Apprenticed as a foundryman, c.1700. Settled in Würzburg to work in the foundry of Ignaz Kopp, 1711; trained in architecture, 1711–13; worked on a map of Würzburg, 1714–15; worked for the chief architect of Würzburg, Josef Gretsing, from 1715; appointed architect of a new Grand Palace in Würzburg by the Prince-Bishop Johann Philipp Franz, 1719; became first architect of Würzburg, by 1724; appointed *baudirektor*, 1729; consultant for military and civil building in Trier, 1733. Died in Würzburg, 18 August 1753.

Selected Works

Interiors

- 1717–53 Residenz, Würzburg (building and interiors; not completed until 1776)
- 1721–36 Schönborn Chapel, Würzburg (building and interiors)
- 1733–44 Schloss Werneck (Schönborn Summer Palace), Werneck (building and interiors)
- 1738–40 Rombach Palace, Würzburg (building and interiors)
- 1740–48 Schloss Augustusburg, near Brühl (grand staircase)
- 1753 Palace, Veitschöchheim (additions and stair)

Neutra, Richard 1892–1970

Austrian-born American architect and designer

Austrian-born Richard Neutra, who emigrated to the USA in 1923, was one of the most important and influential architects working on the West Coast between the late 1920s and the 1960s. Based in Los Angeles, but practising throughout California, Neutra played a key role in developing and establishing the distinctive California Modern style of "Contemporary" architecture and interior design during the middle years of the 20th century. He pioneered the use of curtain wall windows and he was an expert in the handling of light and space within the domestic interior. In his houses he was less concerned with the visual impact of the exterior, and more interested in the creative interplay between the interior of the house and its surroundings. Through his uninhibited use of floor-to-ceiling glass windows, he broke down the barriers between indoor and outdoor space, and brought the landscape inside the house in a very direct and immediate way, an approach which was particularly well-suited to the mild temperate Californian climate.

Influenced but not over-awed by Frank Lloyd Wright,

Neutra worked briefly for Wright at Taliesin in 1924 before moving to Los Angeles early the following year to join his friend and compatriot, Rudolph Schindler. It was as a result of contacts made through the latter that Neutra obtained his first important commission for the Lovell "Health" House in 1927. Along with Schindler, Neutra was responsible for introducing Californians to the cutting edge of European Modernism during the late 1920s and 1930s. The white-walled Lovell House, completed in 1929, was constructed on a steep site high up in the hills overlooking Los Angeles, and incorporated many Le Corbusian features such as ribbon windows, open planning, and roof terraces. The house received considerable media attention and established Neutra's reputation as one of the leading architects of his day. However, although Neutra's architecture of the inter-war years was highly accomplished, his most original work was carried out later, during the 1940s and 1950s. Two acknowledged masterpieces from this period are the Kaufmann House of 1946, also known as the Desert House, which was built for Frank Lloyd Wright's patron, Edgar Kaufmann at Palm Springs; and the Moore House in Ojai, California, completed in 1952. The feeling of expansiveness inside these pavilion-like single-storey dwellings, both situated in dramatic mountain settings, is accentuated by the generous use of windows which give minimal interruption to the view. The interiors have a serene quality because of the simplicity of their structure and the free flow of space between rooms and between the interior of the house and the surrounding landscape.

One of Neutra's major contributions to interior design was his refinement of open planning. It was a concept he inherited rather than originated, but which he developed to a degree of sophistication unmatched by either his predecessors or his contemporaries. A strong Japanese influence is evident in the simplicity and clarity with which he handled interior space. Neutra had visited Japan in 1930, and a knowledge of traditional Japanese architecture informs his treatment of open planning after this date. When only a small amount of space was available, he was able to make this seem much larger than in fact it was. Conversely, however, when a larger plot was available, Neutra made full use of the freedom and expansiveness which this allowed. He exerted a strong influence on other architects working in California, particularly those such as Craig Ellwood and Pierre Koenig who worked on the Los Angeles Case Study Houses sponsored by *Arts and Architecture* magazine during the first two decades after the war. This was a project with which Neutra himself was also directly involved, although only one of the three houses he designed, the Bailey House of 1947, was actually built.

In historical terms Neutra's most significant contribution was not just in transporting Modern Movement architectural ideas from Europe to America – important though this was, others such as Schindler were equally successful in this respect – but in leading the way forward from the self-imposed restrictions of inter-war Bauhausian Modernism to the greater freedom of expression of the post-war "Contemporary" style. It was Neutra who was instrumental in defining this style and who was responsible for leading the move away from clinical white walls to natural materials such as wood and stone, which he used as cladding on both the interior and the exterior of his buildings. Neutra's interiors were clean-lined without being

antiseptic: he was not afraid to introduce natural textures into his interiors in the form of exposed masonry and unpainted wood. Wright had also done this, but with Wright the effect was often rather heavy, as when he used areas of rough-hewn stone in his interiors; Neutra lightened the effect considerably by restricting the areas in which these materials were used and by combining these textured surfaces with large expanses of glass.

Unusually responsive to his clients' needs, Neutra's early post-war houses had a relaxed and human quality which made them both aesthetically pleasing and enjoyable to live in, while at the same time being extremely functional. His careful choice of materials and his sensitivity to site-planning ensured that his houses were perfectly integrated with their surroundings, as well as being visually coherent both internally and externally. Unlike Wright, Neutra did not seek to impose his own ego on his designs but worked closely with his clients during the initial planning stages in order to ensure that what he produced satisfied both their specific practical requirements and their spiritual aspirations. Over time, however, he was able to develop a range of principles and formulae that could be applied to almost any house, rather than to one house in particular. Thus he worked from the particular to the general, which is why his houses really worked in practical terms, because the way in which they were designed grew organically out of the needs of the occupants.

Neutra was an architect who expressed himself most effectively when working on a domestic scale. For this reason, because he rarely worked on commissions for public and commercial buildings, his achievements have received only limited recognition compared with the other big-name architects of the mid-20th century. Also, with Neutra's output being mainly limited to projects on the West Coast, he received less attention in the USA than certain other architects, such as Philip Johnson, who were based on the East Coast, and more closely associated with the influential Museum of Modern Art. Today, although most of his work remains in private hands and is thus largely hidden from view, it is well documented through the evocative photographs taken at the time by Julius Shulman, and it is largely through these memorable images that Neutra's achievements live on. Shulman was particularly adept at capturing the free flow of space in Neutra's houses, and the way in which the architect broke down the physical barriers traditionally erected to mark the division between the interior from the exterior of a house. In his dwellings the physical environment became part of the fabric and decor of the building itself.

A pivotal figure in the history of interior design because of the uninhibited and creative way in which he handled light and space, Neutra made dramatic use of floor-to-ceiling curtain wall windows, creating rooms in which not just one, but several walls were composed entirely of glass. He also reduced window framing devices to a minimum, and in rooms where glass met glass at a right angle in the corner, he adopted the Wrightian formula of frameless mitred glass joints, thereby ensuring that the visual interruption between the interior and the environment was minimised. To control the amount of light entering the house, Neutra installed *brise-soleils*, movable angled broken screens which added a dynamic rhythm and an interplay of light and shadow in the interior. The influence of

Wright was crucial in many respects, although the final results were very different. For example, Wright sought to limit and control the amount of light penetrating the interior, and to create strong lighting contrasts between adjacent rooms, while Neutra sought to maximise the impact of natural light and to create a more even spread of light throughout the house.

LESLEY JACKSON

Biography

Richard Josef Neutra. Born in Vienna, 8 April 1892; emigrated to the United States, 1923; naturalized 1929. Studied architecture under Rudolph Saliger, Karl Mayreder and Max Fabiani, at the Technische Hochschule, Vienna, 1911–15 and 1917–18. Served as an Artillery Officer, Imperial Austrian Army, in the Balkans, 1914–17. Married Dione Niedermann, 1922; 3 children. Worked in Switzerland with the landscape architect Gustav Amann, Zurich, and in the offices of Wernli and Staeger, Wädenswil, 1919–20. Worked with Pinner and Neumann, and with Heinrich Stanner, Berlin, 1921; City Architect, Luckenwalde, 1921; assistant architect in the office of Erich Mendelsohn (1887–1953), Berlin, 1921–23. Active as an architect and designer in the US from 1923. Worked in the office of Holabird and Roche, Chicago, 1924; resident with Frank Lloyd Wright (1867–1959), Taliesin, Wisconsin, 1924; lived and worked with Rudolph Schindler (1887–1953), Los Angeles, 1925–30. In private practice, Los Angeles, from 1925; in partnership with Robert E. Alexander, 1949–58; in partnership with his son Dion in Richard and Dion Neutra and Associates, 1965–70. Designed site-specific furniture from the late 1920s. Published numerous books and articles on modern architecture and design. Received many prizes and awards including the Order of Merit, Federal Republic of Germany, 1959, and Gold Medal, American Institute of Architects, awarded posthumously, 1977. Fellow, American Institute of Architects, 1947; Honorary Member, Royal Institute of British Architects, London, 1954; Benjamin Franklin Fellow, Royal Society of Arts, London, 1965. Died in Wuppertal, Germany, 16 April 1970.

Selected Works

The Richard Neutra Archive, containing a large collection of drawings, photographs, correspondence and diaries, is in the University Research Library, University of California, Los Angeles. A complete catalogue of his architectural commissions appears in Hines 1982.

- 1929 Lovell House, Los Angeles (building, interiors and furniture)
- 1933 Van Der Leeuw Research House (Neutra House), Silverlake, Los Angeles (destroyed by fire 1963; rebuilt by Neutra with his son Dion 1964)
- 1935 Beard House, Altadena, California (building and interiors)
- 1936 Von Sternberg House (Ayn Rand House), San Fernando Valley, Los Angeles (building, interiors and furniture): Josef von Sternberg
- 1938 Schiff House, Los Angeles (building and interiors)
- 1940 Kahn House, San Francisco (building, interiors and furniture): Sidney Kahn
- 1942 Nesbitt House, Brentwood, Los Angeles (building, interiors and furniture)
- 1946 Kaufmann House (Desert House), Palm Springs, California (building, interiors and furniture): Edgar Kaufmann
- 1947 Bailey Case Study House, Santa Monica Canyon, Los Angeles (building and interiors)
- 1948 Tremaine House, Montecito, California (building and interiors)
- 1952 Moore House, Ojai, California (building and interiors)

Neutra's site-specific furniture has included a tubular steel *Cantilever* chair for the Lovell House (1929), and a bentwood model for the Tremaine House (1948), the *Camel* table for the Kahn House (1940), and the *Boomerang* chair for the Nesbitt House (1942). These and several other pieces have been reproduced in limited editions from 1990 by Prospettive in Italy.

Noguchi, Isamu 1904–1988

American sculptor and designer

Isamu Noguchi is most celebrated for his sculpture and serene, austere "stone gardens," yet his furniture and lighting designs have become icons of the post-World War II American home. Noguchi was drawn to social activism during the 1930s, and

Noguchi: biomorphic sofa and footrest for Herman Miller, late 1940s

his political idealism fueled a desire to communicate through “humanly meaningful” sculpture. Although he wrote in 1936 that artists “should inject their knowledge of form and matter into everyday, useful designs of industry and commerce,” his own hugely influential forays into product design were nevertheless limited in number. Throughout his career Noguchi’s primary ambition was the integration of sculpture into a harmonious designed landscape. Motivated by both social and sculptural concerns, his first design for a playground (*Play Mountain*, 1933; unrealized) was a harbinger of the public sculpture installations or “gardens” for which Noguchi increasingly received commissions after 1951. The idiosyncratic theater sets and costumes which he designed for Martha Graham and others between 1935 and 1966 also arose from his interest in creating a total sculptural environment. As his reputation as an artist grew, this concern gradually led him away from design.

Noguchi’s form-language was deeply influenced by the work of Constantin Brancusi (with whom he was apprenticed in 1927–29), Joan Miro, and Jean Arp, although he himself

credited the traditional Japanese respect for natural form rather than other artists. In particular, Noguchi’s regard for the ideas of the futurist R. Buckminster Fuller, who sought to describe the essential structures of the universe, reinforced his response to Brancusi’s smooth, reductive forms. The influence of Miro’s and Arp’s biomorphic Surrealism can be traced in many of Noguchi’s sculptures from the late 1930s and early 1940s, and it is their vocabulary of tense parabolic curves and interlocking forms which informed his early design work. The streamlined anthropomorphic form of *Radio Nurse*, designed for Zenith Radio Company in 1937, evinces both “modernity” and a strangely comforting watchful quality appropriate to its purpose as an electronic baby monitor. Marketed in response to parental anxieties raised by the Lindbergh kidnapping and shown at the Whitney Museum of American Art (New York) in 1938, the Bakelite *Radio Nurse* was an artistic and commercial success. Noguchi later referred to it as “my only strictly industrial design.”

Shortly thereafter, Noguchi was approached by Jean-Michel Frank, the Modernist interior designer and furniture dealer

who produced Giacometti's designs. While this project never materialized, it may have inspired A. Conger Goodyear, then president of the Museum of Modern Art (New York), to offer Noguchi his first furniture commission. The rosewood base of *Articulated Table* (1939) was carved in two sections, their sweeping arcs joined and punctuated by a sphere. This complex yet extremely clear sculptural form created a tripod support for the table's kidney-shaped glass top. *Articulated Table*'s poise and drama created a quiet stir, and the architect Philip Goodwin was next in line to commission a table. Unfortunately, it also attracted the eye of the unscrupulous designer T.H. Robsjohn-Gibbings, who published an uncredited, slightly altered version of a model Noguchi had produced for him without pay. In revenge, Noguchi developed a simplified variant of his design to illustrate an article written by George Nelson, the forward-looking design director for Herman Miller Inc. This became the prototype for the famous occasional or coffee table (*IN50*) introduced by Herman Miller in 1945. Available in walnut and ebonized wood with plate glass, this table was immensely popular; it spawned innumerable imitations, and its precise, clean lines were cheerfully translated into exaggerated amoeboid shapes by mass manufacturers trading on novelty. Herman Miller offered Noguchi's table continuously until 1973; it was brought back into production in 1984 to meet renewed interest in post-war design.

Herman Miller's collections featured Noguchi's furniture through 1951, although his other designs did not receive such sustained enthusiasm. All of them display his uncompromising sculptural approach. The ebonized wood *Chess Table* (1947) includes swinging pockets for game pieces which, when closed, are seamlessly integrated with the tabletop's swelling lines. Noguchi's dining room table (1949) was available with an optional narrow plant well which allowed fresh or dried arrangements to spring unmediated from the contoured top; the table and accompanying stools were each supported by bold parabolas of plywood and two hairpin-shaped steel arches. The sofa and matching ottoman (1949) extended Noguchi's fascination with taut arcing curves into the lush realm of upholstery. Its sensuous, enveloping expanse recalls both *Mae West's Lips* (1936) – Salvador Dalí's preposterous red satin sofa – and the tightly clipped waves of shrubbery in Japanese gardens.

Noguchi also produced custom furniture for a select group of clients during this period, mostly tables of laminated wood or stone. Unhindered by the constraints of mass production, these are more complex and ambitious than his pieces for Herman Miller and were almost certainly treated as sculpture by their owners. His last commercial designs, a table and rocking stool (1954) for Knoll Associates, were made of wooden disks separated with interlaced lengths of steel wire; the stool's moulded base allowed it to rock. Inexpensive to produce, they were widely copied.

Noguchi's lamps express a different sensibility. He had installed electric light in *Musical Weather Vane* (1933), and took up the idea again in the mid-1940s with the Lunars, eccentric magnesite sculptures which emit colored light from concealed bulbs. But Noguchi's table lamp for Knoll (designed 1944), by comparison, is elegant and startlingly simple: a cylinder of translucent plastic supported with three slender

wooden sticks. This was a great success for Knoll, as well as the many manufacturers who appropriated it. Its stark clarity suggests Noguchi's interest in Japanese design, and the translucent plastic shade diffuses light much like a *shoji* screen. His *Akari* lamps, initially produced in Gifu, Japan, were drawn directly from traditional models. The first *Akari* were spheres and pod-shapes of mulberry bark paper pasted over steel wire, supported on tripod legs or hung from the ceiling. Noguchi regularly introduced new designs: later versions used wide spirals of bamboo instead of steel wire, adjustable colored paper sleeves, and myriad shapes. Often arranged in groups of two or more, *Akari* became ubiquitous in stylish homes of the 1950s and early 1960s. Their austere, clean forms suited the open-plan home perfectly, and their sculptural presence enlivened spare, functional modern interiors. Because they were also cheap – especially in plagiarized versions – they were later associated with hippie chic, and few dormitory rooms were without one.

Disgusted by the rampant theft of his designs, in the late 1960s Noguchi began producing *Akari* in larger, subtler forms which were less easily reproduced. The contrast between their commanding, dramatic form – many rise from floor to ceiling – and soft, diffuse light has great expressive power. Noguchi's intention is best assessed in a room at the Isamu Noguchi Garden Museum (Long Island City, New York) devoted to *Akari*. There the quietly dominant ranks of pristine, shadowy lamps create an insistent hush. Unsatisfied with the "fragmentary approach" of his design work, Noguchi described his ideal: "A room of music and light, a porous room within a room – in the void of space. But where to find a client ..." In the Garden Museum, Noguchi became his own client.

Noguchi never used his own furniture in the homes he created for himself, although he filled them with *Akari*. At his Japanese homes in Kamakura (1952–56) and Mure, Shikoku (1971–88), Noguchi lived in 200-year-old farmhouses furnished with traditional *shoji*, *tatami*, and low benches which concealed his record player. Even his New York studios approximated traditional tea houses. In Kamakura his studio, which was literally carved from a hillside, evoked a more primitive Japan. Neither Japanese nor Western, Noguchi's personal retreats represented a search for the imagined purity of traditional life. His father's memorial (*Shin Banraisha*), a room which Noguchi designed for Keio University in 1951–52, embodies his dual heritage: its three levels accommodate Western- and Eastern-style seating, and the fireplace, despite its sweeping, modernistic chimney hood, also functions as a *hibachi* table.

JODY CLOWES

Biography

Born in Los Angeles, 17 November 1904; moved with his family to Tokyo, 1906. Apprenticed to a cabinet-maker, Chigasaki, Japan, 1917; attended school in Indiana, 1918–22; studied at Leonardo da Vinci Art School, New York, 1923–26, and studied medicine at Columbia University, New York, 1924–27. Active as a sculptor of portrait busts, 1920s and 1930s; worked as Constantin Brancusi's assistant, Paris, 1927–29, where he met Alberto Giacometti. Active as a sculptor, New York, from 1932. Designed furniture and lighting from the late 1930s; designed ceramics produced in Japan. Voluntary intern, relocation camp for Japanese-Americans, Poston, Arizona, 1942. Married Shirley Yamaguchi, 1953 (divorced 1955). Established

Isamu Noguchi Garden Museum, Long Island City, New York, 1980s. Died in New York, 30 December 1988.

Selected Works

- 1937 *Radio Nurse* child monitor for Zenith Radio Corporation, Chicago
- 1939 *Articulated Table* for A. Conger Goodyear
- 1951–52 Memorial Room (*Shin Banraisha*), Keio University (interiors)
- 1952–56 Noguchi House, Kamakura, Japan
- 1961– Noguchi Studio, Long Island, New York
- 1971–88 Noguchi House, Mure, Shikoku, Japan (interiors and furniture)
- 1980s Isamu Noguchi Garden Museum, Long Island City, New York

Noguchi's first *Akari* lamps were designed in 1952. His designs for Knoll include the 3-legged table lamp (1944), children's table and rocking stool (1953), and dining table (1957). Work for Herman Miller includes the occasional or coffee table (IN50, 1945), chess table (IN61, 1947), dining room furniture (IN20, 1949), sofa and ottoman (IN71 and IN72, 1949). He also designed theatre sets between 1935 and 1966.

Noyes, Eliot 1910–1977

American architect and designer

Eliot Noyes was born in Cambridge, Massachusetts; he grew up there and attended a prep school and Harvard University where he studied the classics, majoring in Greek. His interest then turned to architecture, leading him to continue at Harvard in the Graduate School of Design where he was able to study under Walter Gropius and Marcel Breuer. When the Museum of Modern Art decided to create a Department of Industrial Design, Noyes was recommended as the department's first curator by Gropius. In this role, Noyes had an indirect but extremely important impact on the development of interior design in America. He was the organizer of a museum-sponsored competition in 1940 with the title *Organic Design in Home Furnishings*. Prior to this time, modern furniture and modern interiors were highly unusual in America.

The winners of the competition included a number of designers who were destined to become leaders in the development of Modernism in the United States. The most important and influential of this group were Charles Eames and Eero Saarinen who collaborated in a group of designs that included chairs and modular storage components. One of Noyes's objectives in the competition was to achieve a collaboration between the winning designers, manufacturers and retail stores. An effort was made in this direction, but had only limited success. The chair designs by Eames and Saarinen depended on moulded plywood in complex, multiple curved shapes. No manufacturer was able to duplicate in production the forms that the winning designs used. The prototypes shown at the Museum had been painstakingly made by hand.

Noyes was the author of a book that included a brief introduction on the development of modern furniture and a discussion of the winning designs. This publication brought Eames and Saarinen recognition as significant designers of modern furniture. Each continued to work in this area and each ultimately achieved great success with other designs (by Eames in 1946 and by Saarinen in 1948) that can be viewed as derivative from those submitted in the competition planned by Noyes.

Noyes served in the US Air Force during World War II and returned briefly to the Museum of Modern Art before becoming the design director for the industrial design office of Norman Bel Geddes. He established his own design firm in 1947 with an office in New Canaan, Connecticut. An acquaintance with Thomas Watson, Jr., established during World War II when both were involved in the production of gliders for military service, led to the invitation by Watson, who was head of International Business Machines (IBM), a major American corporation, to act as design director for the firm. Noyes established a design program of the highest quality for IBM, directing the selection of architects, interior designers, and graphic designers and supervising their work. Some IBM projects were taken on by Noyes himself, resulting in several IBM electric typewriters, including the 1961 model named *Selectric*, which became important successes in both functional and aesthetic terms.

Noyes was a practising architect as well as an industrial and interior designer. His houses were often simple, rectilinear

shapes, incorporating open-plans with separate activity areas created by furniture, fireplaces or wall screens. He was particularly fond of using free-standing fireplaces to divide living space from dining space and had a great liking for natural materials, including stone and wood. His own house in New Canaan received a *Progressive Architecture* design award in 1954 as a distinguished example of American Modernism. Its sparse, open geometric plan and straightforward, simply expressed structure created an uncluttered background for his many arts treasures and foreign artefacts. The so-called Bubble House at Hobe Sound, Florida, was constructed by spraying wet concrete onto a large inflated balloon to create a hemisphere. In addition to IBM, his corporate clients included the Westinghouse Corporation and the Mobil Oil Company. In each case he developed a design program of high quality, helping to set the client companies apart from their competitors. His work for the Xerox Corporation included a striking showroom in New York in which displays were placed on an "island" within a simulated pool with connecting bridges.

Noyes's work was much admired, often exhibited and received many awards. He served as president of the Aspen Design Conference from 1965 to 1970. He was highly respected within the design professions and became an effective spokesperson for the concepts of excellence in every design field. His long relationship with IBM and the fine quality of every design activity he supervised for the firm came to be regarded as a model of an ideal designer-client relationship.

JOHN F. PILE

Biography

Eliot Fette Noyes. Born in Boston, 12 August 1910. Educated at Harvard College, Cambridge, Massachusetts, 1928–32; attended Harvard Graduate School of Architecture under Walter Gropius and Marcel Breuer, 1932–35 and 1937–38, M. Arch. 1938; awarded Wheelwright Travelling Fellowship, 1939. Married Mary Duncan Weed, 1938; four children. Architect on the University of Chicago's Iranian archaeological expedition, 1935–37; draftsman in the office of Coolidge, Shepley, Bulfinch and Abbot, in Boston, 1938, and in the office of Walter Gropius and Marcel Breuer, in Cambridge, Massachusetts, 1939–40. Served in the US Air Force, 1942–45. Director of the department of industrial design, Museum of Modern Art, New York, 1940–42, 1945–46; design director, Norman Bel Geddes and Company, New York, 1946–47. In private architectural and design practice as Eliot Noyes and Associates, New Canaan, Connecticut, 1947–77; also design consultant to IBM, 1956–77, Westinghouse Electric, 1960–76, Mobil Oil, 1964–77, Pan American World Airways, 1969–72, and Massachusetts Institute of Technology, 1972–77. Curator of Exhibitions, 1948–50, and Associate Professor and Critic of Architecture, 1948–53, Yale University, New Haven. President, Aspen Design Conference, Colorado, 1965–70. Numerous awards, including: Award of Excellence for House Design, *Architectural Record*, 1956, 1957, 1959, 1971, 1974; First Honor Award and Centennial Medal, 1957, and Industrial Arts Medal, 1965, American Institute of Architects; Award of Merit, *House and Home*, 1957; Design Medal, Society of Industrial Artists and Designers, London, 1971; Design Excellence Award, *Industrial Design*, 1975. Fellow, American Institute of Architects, Industrial Designers Society of America, and Royal Society of Arts, London. Associate, National Academy of Design. Died in New Canaan, Connecticut, 18 July 1977.

Nurseries

While the aristocracy in Europe, as elsewhere in the world, had often maintained special quarters for children, nurseries were rare even among the upper classes before the late 18th century. But as houses became larger and rooms more specialized, affluent European families increasingly assigned children to their

Nurseries: *Sleeping Beauty* wallpaper, designed by Walter Crane, 1879

own realm. Nurseries offered parents and guests a measure of quiet privacy, and kept children away from valuable furnishings and the influence of lower-class playmates and servants other than their nurses and nannies. Their controlling aspect reached its height in the strictly regulated late 19th century nurseries of the English upper class, which often constituted a suite of day and night nurseries and a schoolroom. Elsewhere children tended to be less formally cloistered.

Since visitors rarely saw them, early nurseries were simply furnished with outmoded furniture – often painted white to reveal dirt – and inexpensive textiles and oilcloths. They were usually remote: attics were a favorite location. Fanciful mid-19th century bassinets and cribs hung with curtains like the “state cradles” of the French nobility were intended for presentation in the parlor or best chamber, not the nursery. There utility, cleanliness, fresh (often cold) air and sunlight reigned, at least in the ideal. Scrubbed or painted floors, washable rugs, curtains and tablecloths, cribs and beds, a table and chairs, a washtub, and miscellaneous dishes for nursery meals were the basic elements. If space permitted, there might be a low seat or rocker for mother or her surrogate, a wardrobe or chest of

drawers and a cupboard for toys. English children, who took nearly all their meals in the nursery, also required a cupboard for food and china. High fenders or fire-screens shielded the fireplace, if there was one, and whenever possible plenty of floor space was left clear for safe romping. Swings and jumpers allowed small children to exercise while securely confined. By the 1860s chromolithographs with religious or sentimental scenes, chosen as much for their good influence as aesthetic appeal, adorned the walls: Raphael’s *Madonna and Child* was phenomenally popular, but so were pretty scenes of children helping their elders, siblings and pets.

Before about 1875 specialized nursery furniture was limited to cribs, child-sized beds and chairs, and low adult chairs for dressing, washing and minding children. Even so, most mid-century nursery chairs and beds were just diminutive versions of inexpensive Windsor, cane and bentwood forms for adults. Highchairs and the stiff-backed “Astley Cooper” chair, designed by a surgeon to encourage good posture, were the exceptions. Although highchairs were designed for dining at the family table, many were used in the nursery to feed small children with minimal fuss. After about 1870 they often came with attached trays or play-boards. Unswaddled babies easily wormed out of their cradles (and rocking, doctors warned, might addle their brains), so tall, stable cribs came into use by 1850. Hardwood or brass cribs were simply polished, but cheap softwood and iron ones were painted, usually white or green. More pretentious models were “japanned” to imitate cane or fine wood. Slats and spindles offered ventilation, but babies’ heads sometimes got stuck between them; to avoid this, parents could resort to canvas, punched sheet-metal or fret-sawn wooden sides. Since Victorian nursery windows were kept open at night, many children’s bedsteads had tapered “head-guards” to protect them from drafts. Sash blinds of stretched muslin, fitted snugly in the window, or folding screens also minimized the draft, and screens also hid the beds conveniently during the day. Scrapbook pictures and wallpaper cut-outs were favorite ornaments for screens, despite the scorn of many decorating advisors.

New manufactured goods and the concerns of progressive reformers dramatically boosted the nursery’s status toward the end of the 19th century. Special wallpapers were available by the 1850s, but in 1875 Walter Crane became the first prominent illustrator to translate his picture-books into wallpaper designs. Crane’s delicate “Flower Fairies” and rustic nursery rhyme characters perfectly expressed the cheery, innocent air of idealized Victorian childhood. Kate Greenaway’s demure girls were also parlayed into wallpapers early on, and widely plagiarized. Similar designs were soon transferred to nursery china, candlesticks, hot water bottles, and tiles. Wallpaper friezes and panels left the lower walls bare for scrubbing, but dadoes were also suitable once “sanitary” papers were introduced in 1871, and were often placed at children’s eye level. Wallpapers fell out of fashion by the 1930s, and later designs have generally been uninspired. Still, they have remained available throughout the 20th century, often setting a theme echoed in fabrics, china, lamps, furniture and even switch-plates by canny manufacturers. Noah’s Ark, gentle rabbits, and fairies were joined early on by teddy bears, the Brownies and Winnie-the-Pooh; but Walt Disney’s characters have dominated mass-market nursery furnishings since the 1930s.

Late 19th century suites of nursery furniture were far less ornate than those for adults. Simple, straight lines and painted surfaces were considered hygienic, and sturdy "peasant" forms reflected new ideas about children's primitive nature. Nevertheless, painted wicker nursery furniture remained fashionable through the 1930s. Toy and china cupboards, clothes-trees and washstands joined the traditional chairs, beds and tables, scaled down to encourage orderly habits in children. Charged with providing a proper moral and physical atmosphere, many parents added bookshelves, chalkboards, sand-tables, aquariums, birdcages and window-boxes to create a stimulating environment. Play areas could be defined with low platforms or set off with gates, and built-in playhouses were very popular among the wealthy. Pastel pink, blue, yellow and white with chintz, muslin or dotted Swiss gave turn-of-the-century nurseries a light, airy quality; blue was recommended for babies of both sexes. Fireplaces and washtubs disappeared by the 1920s, and modern living was represented in the nursery by linoleum floors and electric ceiling lamps.

Few decorators had concerned themselves with the nursery before 1900. Charles Rennie Mackintosh's austere style, echoed in nursery designs by artists associated with the Glasgow School of Art, was remarkably suited to the clean, bright pre-war ideal. Similarly, early members of the Parisian Société des Artistes-Décorateurs exhibited model nurseries which were charming yet essentially conventional. Changing attitudes about child psychology and the importance of boisterous play, however, encouraged a growing preference for saturated colors and livelier themes. Swedish painter Carl Larsson's use of strong red, green and yellow in his children's rooms (c.1909) was a harbinger of this trend, which was taken to a delightful extreme in the brash nursery murals displayed in the Omega Workshops' London showroom (1913): these were painted on the ceiling as well as the walls, for the benefit of crib-bound babies. Despite rapid stylistic changes, from 1920 to 1960 most designers consistently favored bright primary colors against white and bold, uncluttered furniture. Built-in shelving and beds were recommended for smaller homes. Consumers, however, have clung just as consistently to softer, sweeter colors and romantic fabrics, and today choose gentle pastels or vibrant hues with equal confidence. Lacy ruffled bassinets and cribs, which reformers had never really managed to eradicate, were brought back unabashed during the 1970s – not as isolated presentation pieces, but as central elements of the nursery.

Synthetic laminates and moulded plastic furniture have been pervasive since World War II, but the major contributions of the 1950s were mobiles and circus motifs. New lines of "growing" furniture were designed to suit, first, baby's domain and later, assisted by fresh paint and accessories, a teenager's haven. During the 1960s the ubiquitous white was gradually replaced by light "natural" wood, but futuristic lucite baths and Pop-inspired graphics made little headway in the nursery. Since the 1970s safety, rather than style, has taken center stage.

Crib slats, folding tables, lamps, playpens, highchairs, toys and appliances are now subject to strict standards, and even innocent-looking pillows and blankets are closely scrutinized.

Selected Collections

Large collections of children's toys, artefacts and furnishings are in the Bethnal Green Museum of Childhood, London, the Museum of Childhood, Edinburgh, and in the Margaret Woodbury Strong Museum, Rochester, New York. Collections of nursery wallpapers are in the Victoria and Albert Museum, London, and the Cooper-Hewitt Museum, New York. Examples of reconstructed Victorian nurseries and schoolrooms can be seen in the Mill-Owner's House, Bradford Industrial Museum, Yorkshire, and the Mark Twain House, Hartford, Connecticut.

Further Reading

The most useful survey of the history and development of the Nursery during the 19th and 20th centuries is White 1984 which discusses furnishings and decorations, as well as ceramics and book illustration. Much information can also be found in contemporary 19th and 20th century home decorating manuals. For excellent studies of the history of childhood see Ariès 1962, Calvert 1992, and Kevill-Davies 1991.

Ocean Liners

In the summer of 1840 Samuel Cunard's first steam-powered ship, the *Britannia*, left Liverpool docks, carrying mail and passengers on a twice-monthly contract with the British Admiralty. Two years earlier, the British and American Steam Navigation Company's ship, *Sirius*, had been the first ship to cross the Atlantic under continuous steam power, arriving in New York on 23 April after only fifteen days at sea.

Having proved that the North Atlantic could be crossed safely, companies on both sides of the ocean sought to produce the fastest ship possible. The Collins Line, owned by the American magnate, Edward Knight Collins, joined the race with four ships, the *Atlantic*, *Pacific*, *Arctic* and *Baltic*, boasting luxury accommodation such as heated public rooms, bath-rooms, a barber and spacious state rooms decked out in exotic woods. By 1897, the German Norddeutscher Lloyd Line's *Kaiser Wilhelm der Grosse*, had arrived in New York from Southampton in just under five days, followed in 1907, by Cunard's *Lusitania* and *Mauritania*, which both took just four days, reclaiming the much-prized "Blue Ribband" (awarded the fastest ship) from the Germans.

After 1918, an Act of Congress limiting immigration into the United States severely restricted transatlantic traffic, and caused companies like Cunard to rethink their operation. By the late 1920s, their "Queens of the North Atlantic", as they were popularly known, were nearing retirement, and plans were made to launch a new and much bigger liner to ensure a twice weekly service. The *Queen Mary* was commissioned in 1930, although because of the Depression she did not finally set sail until 1936, marking a period of intense ship-building in Europe which produced France's *Ile de France* (1927) and *Normandie* (1935) owned by La Compagnie Générale Transatlantique (CGT); Germany's *Bremen* (1929) and *Europa* (1930); and Italy's *Rex* and *Conte di Savoia* (both 1932).

Prior to the 1920s, liners had enjoyed a rather eclectic mix of decorative styles, ranging from historic Old Dutch to the Italian Renaissance on the ill-fated Titanic (1912, owned by the White Star Line), and interiors inspired by the reigns of Louis XIII to XVI on the *France* (1912, owned by the CGT). The new liners of the 1920s and 1930s were predominantly decorated in the then-fashionable Art Deco style, the most stunning examples being the *Normandie* and the *Queen Mary*, both of which were considered by their owners to represent the

latest examples of art and design technology being produced by their respective countries.

The *Queen Mary*, for example, was an all-British ship, produced in John Brown's shipyard on the River Clyde using materials from more than 60 British towns and cities, while on the *Normandie*, an impressive range of materials was employed by specialist designers and craftsmen, including lift grilles and bronze doors by Raymond Subes, stone bas-reliefs by Henri Bouchard, champlevé enamel on cast iron by François-Louis Schmied, and unusual lacquer work by Jean Dunand (1887–1942).

Hailed by one contemporary French art magazine, *L'art et les artistes*, as "a floating museum of contemporary French art", the *Normandie* was illustrated with themes reflecting French and Normandy history, classical mythology and scenes of a nautical flavour. The deluxe First Class cabins, decorated by a group of leading interior designers including the avant-garde design firm Dominique (founded by André Domin and Marcel Geneviève), were called *Caen*, *Rouen*, *Trouville* and *Deauville*.

The decoration of *Normandie's* First Class interiors was overseen by two teams of four architect-designers specially chosen for their previous experience on the luxurious *Ile de France*, including Pierre Patout (1879–1965) and Henri Pacon (1882–1946). Jean Dupas (1882–1964) was commissioned to produce four huge etched-glass relief panels for the Grand-Lounge, a vast space near the top of the ship which resembled the Hall of Mirrors at Versailles. Dupas was assisted by the glazier Champigneulle; their mirrors illustrated scenes from Greek mythology and were silvered and painted on the reverse side using gold, silver, platinum and palladium colours. The only surviving panel, *The Chariot of Poseidon*, (21 by 48 feet) is now in the cafeteria at the Metropolitan Museum of Art in New York.

Lighting was very important to the overall design of the *Normandie's* interiors, especially as there was little natural light available. Different effects were created by a variety of Art Deco wall sconces, chandeliers and vertical strip lighting, while a more subdued atmosphere was created in the Gallery-Lounge by huge pewter urn-shaped lamps by Daurat and tall glass tower lamps by Labouret which threw light onto the ceiling. The *piece-de-la-résistance*, however, was to be found in the First Class Dining Room decorated by moulded and hammered glass slab panels by Labouret and René Lalique

Ocean Liners: First Class Dining Room of the *Normandie*, with chandeliers by Lalique, 1935

(1860–1945). Here, the room (which measured 282 feet long and 28 feet wide) was lit by 38 monumental glass sconces and twelve, 10-foot-high, blazing “fire pots” by Lalique, set at regular intervals around the room.

Criticised by some as not fashionable enough, the interior decor of the *Queen Mary* was probably far less opulent than that of the *Normandie*, relying more on paintings and exotic woods to create its effect of liner-luxury. Described as “Just about the most beautiful ship afloat” by *The New Yorker* magazine, this ship had more than 50 different woods employed on its surfaces and more than 33 British artists were commissioned to decorate it, including leading figures of the contemporary British art world. Dame Laura Knight (1877–1970) and Vanessa Bell (1879–1961), for example, both painted works for private dining rooms (*The Mill Circus* and *Garden*), although Stanley Spencer (1891–1959) turned down his commission when the Directors refused to allow him to paint the riveters at work.

Further works of note are flower paintings by Cedric Morris on the Promenade Deck; carved murals by John Skeaping; and surreal seaside scenes by Edward Wadsworth in the Smoking Room. Kenneth Shoesmith was commissioned to

paint several works, including the *Madonna of the Tall Ships* for the Second Class Writing Room; and the *Madonna of the North Atlantic*, and *Flower Market*, both housed in the First Class Drawing Room, which doubled as a Chapel. Shoesmith had previously designed posters for the Cunard company in the 1920s, advertising their ship the *Aquitania*, and the rather flat and linear *Madonna of the North Atlantic* (painted entirely on a gold leaf background) reflects his talent for graphics.

The *Queen Mary* also had murals, executed by the fashionable interior decorating sisters, Anna and Doris Zinkeisen, photographed at work on the ship in 1936 by the equally fashionable photographer, Madame Yevonde. While Anna decorated the First Class children’s play areas with a doll’s house, animals, cowboys and soldiers, Doris completed a mural in the sophisticated Verandah Grill, where she insisted on it being accompanied by a black carpet and red curtains to enhance its colour.

In their heyday, transatlantic liners like the *Queen Mary* and the *Normandie*, where the majority of berths were First Class, gave almost all passengers the opportunity to experience a lifestyle usually only available to the very rich: facilities such as gymnasiums, swimming pools, and cinemas enabled people to

forget they were even on board a ship. Passengers travelling First Class were also provided with a space for their cars, a kennel for pets, and reading and smoking rooms. As a result, many rich and famous faces were seen at sea: celebrities such as Cary Grant, James Stewart, Greta Garbo, Noel Coward, Henry Fonda and the Duke and Duchess of Windsor, to name but a few, and the chance of seeing them on board increased the attraction of sailing.

The interior decoration of these “floating hotels” clearly reflected and enhanced this luxury and every effort was taken to keep passengers happy: these included on the *Queen Mary*, peach-tinted mirrors in the First Class Lounge to offset the effects of sea-sickness and pink dining room chairs in the private dining rooms to complement the guests’ evening wear. Now permanently docked in Long Beach, California, the *Queen Mary*, hailed recently an “icon of the Twentieth century”, is a rare survivor of a Golden Age of ocean travel and finely crafted Art Deco interiors.

Offices

Today, offices are the environments in which many of us spend the majority of our waking hours, and probably those on which more (professional) design effort is expended than any other. However, as a distinct building type with its own aesthetic, the office is a relatively recent phenomenon. As a

number of commentators have noted, the office has its origins in the Renaissance; Giorgio Vasari's Uffizi in Florence (1560–74) often being cited as the first distinct office building. A few speculative office buildings did appear in London as early as the 1830s, but it was not until the late 19th century in both Europe and North America that sole-purpose office buildings were being erected in any number, or that their architects developed vocabularies of form truly distinct from those of the home. Prior to the widespread emergence of sole-purpose office buildings, the majority of offices were located in primarily residential buildings, and, as a consequence, it was not until the late 19th and early 20th century that the office interior began to take on a non-domestic aesthetic.

The principal catalyst in this transformation was industrialization, which not only brought about a demand for large numbers of banks, law firms and other support services, but which also resulted in the increasing physical separation of work and home. Much of the furniture in late 19th century cellular offices retained an essentially domestic character, but a number of important innovations – principally the telegraph (1844), typewriter (1866) and telephone (1876) – distanced the atmosphere of the commercial office from that of the gentlemen's study. The rapid expansion of clerical work around the turn of the century, and the efficiencies already brought about by some mechanization, led to the widespread adoption of “scientific management” techniques, the origins of which lay in Frederick Taylor's seminal studies of factory labour. Taylor argued that for an industrial process to be efficient, it should be divided into individual stages, each assigned to a different worker who was trained solely to perform that particular task at an optimum rate. By 1911, manuals recommending the division of labour in the office began to appear in the United States, and specialized office furniture and equipment that would facilitate improved efficiency was developed. The replacement of the high-back roll-top desk by a table with only minimal storage space, for example, allowed managers to ensure their workers were operating at maximum efficiency, and effectively eliminated the accumulation of clutter. The sunken-well desk, which provided surfaces at different heights for typing and writing, had been developed in the late 19th century, but scientific management's preoccupation with office mechanization in the 1910s led to its widespread adoption.

The importance of the typewriter cannot be over-emphasized. As Le Corbusier was later to note, its invention also prefigured the standardization of paper sizes, which, through growing recognition of the importance of paper storage, eventually led to the standardization of furniture itself. The needs of typists had also led to the development and refinement of the office chair. The wooden swivel chair on castors had first appeared in mid-19th century America, but it was in the early years of the 20th century that attention was focussed on the ergonomics of such furniture, with the introduction of fully adjustable steel chairs based on those already in use in factories. While much was made of the health benefits such “improvements” would promote, change was motivated primarily by the need for increased efficiency and profit.

Early task chairs and office machines were overtly industrial contraptions. Durability and low manufacturing costs were clearly important issues, but, as Adrian Forty has noted, their appearance “was not ... the result of an absence of design ...

Offices: *Action Office* furniture by George Nelson, 1964

but ... expressed a deliberate intention to associate office and factory" (Forty, 1986). The image of efficiency this association promoted was, of course, as important as the "scientific" methods themselves. Consequently, great emphasis was placed on the standardization of furniture (and, by implication, employees) throughout the organization, although the very features that were criticized as inefficient – roll-tops, storage space, etc. – were often retained by managers to signify their status. The adoption of scientific management techniques had much the same effect in the office as it had in the factory. Workers were no longer skilled individuals with responsibilities, but insignificant components in a machine dedicated to efficiency and profit; goals which became the overriding concerns in the design of office interiors.

After World War II, relatively full employment on both sides of the Atlantic placed offices in direct competition for workers with factories. While industry responded by increasing pay, clerical employers sought to improve the image of office work by rejecting the pre-war industrial aesthetic in favour of (superficially) more appealing working environments. Office interiors took on their own identity, making greater use of light woods, plastics, fabric, upholstery and even carpet. In the United States, developments in structural engineering and efficient fluorescent lighting allowed the dream of the deep, open-plan office building – which had been conceived by Mies van

der Rohe and others as early as 1919 – to become a reality. Seminal examples of this type of steel-framed, curtain-walled building include Mies' Seagram Building (1954–58) and Skidmore, Owings and Merrill's Union Carbide Building (1960). Despite the theoretically important concept of building "transparency", it was standard practice for executives to be given luxuriously-furnished cellular offices positioned around the perimeter of the building, while the vast majority of the workforce were located in large, windowless, open-plan offices at the building's core. Within this artificially lit and ventilated space, carefully monitored staff worked at custom-designed metal desks, stoically arranged in rows conforming to the buildings' rectilinear module. Every aspect of the interiors reflected rigid organizational hierarchies and an individual's position on the company ladder was neatly signified by the size and quality of the furniture with which he was provided, as well as by the presence of windows, carpet, plants and artworks. (It was through their use as status symbols in such offices that many Bauhaus-era furniture designs – particularly Mies' *Barcelona* and *Brno* chairs – came to represent corporate America.) While the model of deep, open-plan office blocks with their rectilinear interior layouts slowly spread throughout Europe, few European examples reflected the same quality of design and attention to detail present in the Mies and SOM projects. Indeed, the majority of European office interiors

retained a somewhat utilitarian and less hierarchical appearance. To many European companies, few of which approached the size of the American corporations, the American corporate approach seemed something of an irrelevance, and a significant alternative was posited which was ultimately to change the face of the office world-wide.

A German management consultancy, Quickborner Team, argued for open-plan offices (dubbed *Bürolandschaft* or “office landscapes”) in which all grades of staff worked in the same space, and where the layout of furniture was principally determined by the flow of paper through the organisation. The resulting organic layouts (which at first sight appear random), and an apparently egalitarian ethos, promoted a more relaxed atmosphere in which communication between individuals and departments was made easier. While *Bürolandschaft* offices were, by definition, deep-plan, the complete absence of floor-to-ceiling partition walls ensured some distribution of natural light. Designers also recognized that visually appealing furniture and fittings encouraged the idea that managers cared about their employees’ well-being as much as their output; a notion given greater credence by the fact that managers used much the same (although still not identical) furniture as their secretaries. Most existing furniture did not lend itself to *Bürolandschaft*’s status-free aesthetic or, indeed, to easy reconfiguration – a critical requirement, and one that empowered individuals to rearrange the layout to suit the particular task in hand. As a direct response to these issues, manufacturers turned first to the development of lightweight movable furniture, and thereafter to systems, and thereby brought about perhaps the greatest revolution in office design this century. Furniture designed around a limited number of standardized parts (which could easily be dismantled and reconfigured) relieved interior designers of their preconceptions over office layout, and could be adapted over time to accommodate both changing tastes and new office technology.

In the vanguard of these developments was the American company Herman Miller – evidence in itself that *Bürolandschaft* did not remain a European phenomenon for long. Miller’s *Action Office 2* system (1968), designed by Robert Propst and George Nelson, represented a radical reappraisal of office work, being the first to replace the conventional free-standing desk with a system of self-supporting screens on which could be mounted a range of standardized components, including work-surfaces and filing frames. Other manufacturers in America and Europe followed Herman Miller’s lead with the introduction of hundreds of systems. Many of these were clearly AO2-inspired screen-based systems, but others devised alternative structural arrangements, notably the beam from which work-surface and storage components could be hung. Systems apparently offered purchasers the otherwise unaffordable option of bespoke furniture, tailored to their company’s current (and future) requirements. They proved extremely popular and quickly became ubiquitous, bestowing on the largest manufacturers (Herman Miller, Knoll, Steelcase, etc.) a powerful theoretical, albeit sometimes pseudo-scientific, voice.

System furniture had theoretically offered individuals, as well as organisations, the possibility of regularly reconfiguring and personalizing their own workstations, assuming of course that employers accorded them that privilege. In practice,

however, the relative complexity of reconfiguration, and the aesthetic continuity of all the components, resulted in system layouts, once installed, being seen as permanent, impersonal and stereotypical environments. As a consequence, the 1970s saw the emergence of some alternatives to the system-dominated office in which personal expression was positively encouraged. Perhaps the most significant example is the Central Beheer Insurance Company’s headquarters (1970–72) in Apeldoorn, Holland, designed by the Swiss architect, Herman Hertzberger. Here, workers were given *carte blanche* to decorate their own areas and even provide their own furniture – a degree of freedom unthinkable in most contemporaneous and more recent office environments. The obvious potential for visual confusion was avoided through the creation of a visually dominant architectural framework, and the use, throughout all parts of the building, of the same materials, fixtures and finishes. The furniture provided was deliberately unobtrusive and quickly became barely noticeable against a backdrop of plants, pictures and personal possessions. Unsurprisingly, however, the dominant form of office interior remained one in which systems (with the subsequent addition of computers) were the key elements around and after which everything else was considered. The unifying feature of Central Beheer was its strong architectural framework – a framework suitable only for that particular organisation. Systems, on the other hand, continued to offer a flexible framework applicable to any office building – many of which were speculatively built – and almost any organisation. Moreover, unlike other furniture, systems could be quickly adapted to accommodate emerging technological hardware with the introduction of new components such as the “cable management” tray. Computers themselves apparently heralded a new, brighter chapter in the history of office work, but, in practice, data processing could be as monotonous and unglamorous as factory labour; a fact which the clean styling of these latest office machines, and the continuing refinement of office systems during the 1970s and 1980s, was carefully calculated to disguise.

Over the past ten years, efforts have been made to improve the image of office work by increasing the degree of control staff have over their working environments. Evidence of this may be found both in the fabric of new office buildings, in such simple measures as the provision of opening windows rather than air-conditioning, and in furniture: Herman Miller’s *Ethospace* system (1985), for example, (re)addressed the issue of personalization with easy reconfiguration based on a system of interchangeable cosmetic tiles. Emphasis has also been placed on the idea that going to the office is about more than going to work, and this has been reflected in the increasing proportion of floor area given over to circulation space and informal gathering areas.

In recent years, much debate has centred on the notion of the home office. While rapid technological development will theoretically enable more of us to work from home, it remains to be seen whether the home office will really be accepted by a significant share of employers (and employees), and whether new forms of furniture will result.

Olbrich, Joseph Maria 1867–1908

Austrian architect and designer

Trained under Carl von Hasenauer, an architect of Vienna's Ringstrasse, and later employed as chief draughtsman in the office of Otto Wagner, Joseph Maria Olbrich was a man of extraordinarily prolific and diverse skills. Described by the Austrian art critic Hermann Bahr as, "a man who is capable of anything!", he was not only responsible for some of the most innovative architecture of the period but he also designed interiors, furniture, cutlery, tapestries, wallpapers, posters and costumes that were equally distinctive in style. Today, along with his compatriot and rival Josef Hoffmann, he is one of the figures most often associated with the Vienna Secession and he played a central role in the emergence of Austrian Jugendstil and the early development of Modernism.

Founded by a group of seven young artists, architects and designers, including Gustav Klimt and Koloman Moser as well as Olbrich and Hoffmann, in 1897, the Vienna Secession represented a radical rejection of the conservative academic style espoused by the Künstlerhaus and the Viennese artistic establishment. Defiantly independent in character, the group emphasised the unity of the arts, favoured a modern, func-

tional alternative to the more decorative excesses of Art Nouveau and was heavily influenced by the work of other European designers including Charles Rennie Mackintosh and C.R. Ashbee. Strongly flavoured by the political and social mood of the period, the work of Olbrich and other Secessionists can be understood as both a response to, and an expression of the changing needs and tastes of a new century and a new generation.

Olbrich worked as Wagner's assistant on the massive Vienna Stadtbahn (city railway) project in the mid 1890s; his earliest independent commission executed under his own name was the design for the layout of the inaugural Secession Exhibition held in 1898 at the Gartenbaugesellschaft (Horticultural Society). Olbrich was responsible for the show's entrance and main exhibition rooms and his arrangement of these displays established new standards in exhibition design. Works were hung at eye-level and pieces were grouped by their respective media. The background colours were matt white, dark red and dark green and were selected to give the exhibit an appearance of overall harmony without detracting from the specific character of individual works.

The experience of this commission served Olbrich well in his next major design project, the Secession Building, which was built to house all future Secession exhibitions. He skilfully solved the problems presented by an exhibition building and the interior was planned with movable walls, so that the space could be arranged to exploit the use of both overhead and side lighting. Olbrich described these walls as "white and shining, sacred and chaste". Function was also a key factor in determining the interior space. Careful consideration was given to the size of each room, and the exhibit spaces were arranged along one main axis. The heating and ventilation system provided constant, stable atmospheric conditions throughout the exhibition area, while the lighting system distributed an even light throughout the rooms and was positioned so as to avoid reflections on glazed surfaces such as picture frames. Thus Olbrich created a setting where works of art could be shown to the best possible effect.

Often described as a rectilinear form of Art Nouveau, Olbrich's style was characterised by simple geometric forms and carefully placed decoration and was based on a respect for the fitness of form for function and an appreciation of materials. He did not exclude decoration, and features such as doors, handrails and light fixtures were embellished with wrought and cast-iron ornament (as well as other metals), but the use of ornament was carefully controlled and never detracted from the practical character of his works.

He worked on a number of interior renovations throughout his career. His elaborate interiors for the Villa Friedmann, designed in 1898, were in an untypically fin-de-siècle curvilinear style. A year later, in 1899, he modernised the interiors of the Alfred Stift House by subdividing the large rooms into smaller, more intimate areas. At David Beil's apartment, he integrated furniture into brilliantly coloured decorative schemes, and the blue music room, designed to create an intense mystical feeling, caused something of a sensation.

The Café Niedermeyer of c.1900 was never actually built, but many of the objects designed for the project were manufactured. Olbrich was responsible for the tables, armchairs, benches, tableware, and serving utensils as well as for the inte-

Olbrich: hall, Olbrich House, Darmstadt, 1900-01

rior space itself. The design of each object was driven first by function and then by beauty and he took as his inspiration the needs of a café user. Thus, the café chair, for example, was designed to suit the posture and requirements of someone reading a newspaper as opposed to someone lounging. And, as with many of his residential schemes, Olbrich divided the space into small areas with subdued lighting in order to create an ambience of cosiness.

Many of these ideas were also realised in the restaurant that he designed for the Provisional Exhibition of 1901. The restaurant had 400 settings that were arranged over two floors. The two levels were linked by a large, central staircase with the more private and desirable corner positions reserved for the tables. Olbrich was responsible for the restaurant's furniture, linen and cutlery, and he collaborated with Paul Bürck on the china.

Olbrich's work on the 1898 Secession Exhibition attracted the attention of Ernest-Ludwig, Grand Duke of Hesse, and in 1899 he invited Olbrich to join his artists' colony in Darmstadt. Olbrich designed a reception room for the Darmstadt exhibit at the Paris 1900 exhibition which was awarded a gold medal. Moreover, as the only architect he was also able to design the public buildings and most of the other artists' houses in the colony which were presented at the Darmstadt 1901 Mathildenhöhe exhibition. These comprised the central studio building, the Ernest-Ludwig House, seven houses including Olbrich's own and many temporary buildings, and Olbrich also designed much of the furniture, lighting and other decorations. The interiors of his own house illustrate most completely his ideas about function and space. For example, while the overall colour schemes of the living room and dining room were blue and white, areas of blue ornament were used to hide the dirt on those parts of the walls and doors that were most subject to wear and tear. Similarly, the delicate gold ornament on the white walls of the dining room also created an impression of brightness; the furniture was made of highly polished cherry wood. A richly woven curtain hid the artist's studio from the adjacent living room. The studio walls were deliberately neutral and quiet in tone and were covered with a grey moiré pattern; while light from the large studio window created a rich array of colours within the interior. Olbrich also designed simple linear patterns on the wall hangings and tapestries, the copper vessels containing flowers for the hallways and opaque, glowing globes for the ceiling pendant.

However, in keeping with Secessionist ideas, Olbrich was not solely interested in functionalist concerns; he also sought to satisfy the unique requirements of individual clients. Thus, in his own house, he took account of his preference for listening to the piano without the distraction of watching the pianist, and the piano was placed on the level above the living room so that the pure and beautiful sounds could come floating down from above, isolating the aural experience from the visual and technical sides of playing.

Olbrich was the official Darmstadt delegate to the First International Exhibition of Modern Decorative Art in Turin (1902). He was responsible for the design of three interiors: the Hessische Zimmer or Blaues Zimmer, a living room in blue, grey and white where examples of the work of Hesse's craftsmen were shown; the Schlafzimmer; and the Tea Salon,

containing furniture by the Glückert firm. These interiors were noted for their subtle colour schemes and marked a move away from the extravagance of his earlier designs towards a simpler, more volumetric, geometrical style. Olbrich won the first prize of 8000 francs for his Hessische Zimmer.

He showed six rooms at the Louisiana Purchase International Exposition held in St. Louis in 1904. Known as a Summer Residence of an Art Lover, these rooms won lavish praise from the critic Hermann Muthesius for their lightness and delicacy. "The fact that Olbrich is a brilliant decorator", declared Muthesius, "was clear from the beginning. Here he shows that he is an inspired interior-architect in the best sense of the word ... This whole Olbrich-Art has something ingratiating, soft, feminine. It is specifically Viennese ... It stands thereby at a great distance from the heavier, thick-blooded German works that almost all take on a rather philosophical meaning". Olbrich was awarded the Grand Prix and a Gold Medal for his work.

Olbrich died of leukaemia in 1908 at the age of forty, just ten years after he had completed his first major commission. But his influence continued far beyond his lifetime. Paralleling Louis Sullivan's tenet "form follows function", he advocated the rejection of historicist styles in favour of a design philosophy based on function. By heightening awareness of international developments and encouraging local Austrian artists, he contributed to the revitalisation of Viennese art. He also helped to publicise the ideas of the Vienna Secession and to develop its ornamental vocabulary through his graphics and articles for *Ver Sacrum*, the movement's journal. And if the radical nature of his views met with resistance from the art establishment in Vienna and Darmstadt, he gained international respect at important exhibitions in Paris, Turin, Moscow, St. Louis and Dresden. His career represented a link between the traditional work of 19th-century Europe and the forward-looking designs of Expressionist artists to follow. Finally, as well as for his extraordinary gifts as a designer, Olbrich is remembered for his unwillingness to accept the status quo and for his spirit of experimentation.

SALLY L. LEVINE

Biography

Born in Troppau, Austrian Silesia, 22 December 1867. Attended the State School of Applied Arts, Vienna, from 1882; studied under the architect Carl von Hasenhauer, Academy of Fine Arts, Vienna, 1890–93. Awarded the Prix de Rome, 1893, and travelled in Italy, Sicily and North Africa, 1893–94. Married Claire Moraure, 1903. Employed as a draughtsman and chief assistant in the office of Otto Wagner (1841–1918), Vienna, 1894–98; established his own architectural practice and active as a designer of interiors and furnishings from 1898. Joined the Darmstadt Artists' Colony, Germany; architect and designer in Darmstadt from 1899; opened a subsidiary office, Düsseldorf, 1907. Founder-member, Deutscher Werkbund, 1907. Exhibited at several national and international exhibitions including: Vienna Secession, 1898; Paris, 1900; Darmstadt, 1901; Turin, 1902; St. Louis, 1904. Died in Düsseldorf, 8 August 1908.

Selected Works

The Olbrich Archive, including drawings and designs for architecture, interiors, furniture, metalwork, and textiles, is in the Kunstbibliothek, Staatliche Museum, Berlin. Examples of his furniture and metalwork are in the Museum of Applied Art, Vienna; other furnishings and material relating to his work in Darmstadt are held

in the Ernst-Ludwig-Haus, now the Museum Künstlerkolonie, Darmstadt.

Interiors

- 1898 Secession Building, Vienna (building, interior fittings and some decoration)
- 1898–99 Max Friedmann House, Hinterbrühl, Austria (interiors, furniture and decoration)
- 1899 Alfred Stift House, Vienna (interiors and furniture)
- 1899 David Beil Apartment, Vienna (interiors, including music room and schlafzimmer)
- 1899–1901 Darmstadt Artists' Colony (architecture, furniture and decoration for 7 private houses and the Mathildenhöhe complex, including the Ernest-Ludwig House, Julius Glückert Houses I and II, and the Artists' Colony Exhibition, 1901)
- 1900 Exposition Universelle, Paris (Darmstadt Colony exhibit)
- 1900–01 Joseph Maria Olbrich House, Darmstadt (buildings, interiors and furniture)
- 1902 International Exhibition of Decorative Art, Turin (design and decoration of a living room, schlafzimmer and tea-room)
- 1902 Playhouse for Princess Elizabeth of Hesse, Wolfsgarten Castle, Germany (building and interiors)
- 1904 Louisiana Purchase International Exposition, St. Louis (interiors and furnishings for a Summer Residence of an Art-Lover)
- 1905–08 Darmstadt Artists' Colony (architecture, furniture and decoration, including the Wedding Tower and Exhibition Building, and the Opel Worker's House)
- 1906–08 Old Castle, Giessen (interiors and furniture)
- 1906–08 Warehouse Tietz, Düsseldorf, Germany (building and interiors; completed by his assistant Phillip Schafer)
- 1908 Julius Glückert House, Darmstadt, Germany (redcoration and furnishings)

Olbrich's furniture was made by several cabinet-makers and manufacturers including Waring & Gillow, the Schöndorff Brothers of Düsseldorf, and the Dresdner Werkstätten. He also designed embroideries, textiles, tapestries, ceramics and glass, lighting, jewellery, silverware, and cutlery throughout his career.

Omega Workshops

British art and craft workshops and decorators,

1913–1919

Founded in July 1913 by art critic and painter Roger Fry (1866–1934), the Omega Workshops' twin aims were to find employment for impoverished young artists and provide an antidote to the prevalent "pursuit of the refined" in interior decoration and in the applied arts.

Roger Fry was a member of the Bloomsbury Group, a loose association of like-minded individuals, many of whom had been members of the Apostles, an exclusive intellectual society, while at Cambridge University. Based on friendship and a shared interest in the arts, the group began meeting in 1905, its name subsequently being derived from the area of London where many of them lived. Although never formally a group and without any unifying dogma, Bloomsbury profoundly affected the development of avant-garde art and literature.

In 1910 Roger Fry enjoyed a succès de scandale with his first Post-Impressionist exhibition at the Grafton Galleries in London. Here, the hitherto claustrophobic and traditionalist art establishment was confronted with the stylistic innovation and simplicity of colour and form of artists like Gauguin, Cézanne, Van Gogh, Picasso and Matisse. It reacted badly. But it was the desire to capitalize on the Post-Impressionist spirit that led Fry to initiate a loan scheme to raise £1500 for a decorative arts workshop. With this working capital he opened the Omega Workshops and showroom with co-directors Vanessa Bell and Duncan Grant at 33 Fitzroy Square in London. An early advertisement for the Workshops listed its wares as: "Examples of interior decorations for bedrooms, nurseries etc., furniture, textiles, hand-dyed dress materials, trays, fans and other objects suitable for Christmas presents."

Fry hoped that the Post-Impressionist style, transferred to everyday artefacts like furniture and crockery, would prove popular and kindle interest in the paintings of the young artists he employed. He offered them a fixed weekly wage of 30 shillings (approximately £60 today) and expended his own energy and time in organizing, administering and drumming up business. Patrons included Lady Ottoline Morrell, the novelist Arnold Bennett and the poet W.B. Yeats.

The Workshops reached a wider public with the publication of an article in the *Daily Mirror* of 8 November 1913, although the story accompanying the three pictures left little doubt as to how the readers of that paper should react to Omega products. A picture of a "typical" Omega room was described thus: "The kind of room in which you would live, that is, if your nerves could stand it"; and a picture of Roger Fry: "Mr Roger Fry thinking out some new futurist nightmare."

Omega accepted all kinds of commissions, ranging from the interior decoration of the Cadena Café in Westbourne Grove,

Omega Workshops: Cadena Café, Westbourne Grove, London, 1914

London to the decor for the palatial home of Lady Ian Campbell at 1 Hyde Park Gardens. It produced murals, stained-glass windows, mosaics, carpets, crockery and pottery, dresses and furniture, all with the emphasis on colour and naivety of design.

The enterprise was co-operative in nature, and Fry decreed that no object or piece of art was to be signed. This would promote a group ethic and a homogeneity of content which would not dilute his vision of "significant form" and colour. And it was in the use of colour that the Omega Workshops were most revolutionary. Gone were the pale, pastel shades beloved of the Edwardians; gone was the contrived prettiness of suburban gentility; in their place an unabashed celebration of pure colour on everything from chairs and screens to pottery and fabrics. A screen painted by Duncan Grant depicted blue sheep on an orange background; another by Vanessa Bell included green bathers in a Cubist landscape.

Omega had opened in July; by October there were already signs of dissent. Four artists, most notably Wyndham Lewis (who already had taken issue with Fry over his requirement of anonymity for the Workshops' products), left amid allegations

that the Omega Workshops had secured the decoration of the Post-Impressionist room at the Ideal Home Exhibition by a "shabby trick", and at the expense of Wyndham Lewis and an outside artist – Spencer Gore. The four dissenters issued a circular to Omega clients and shareholders setting out their complaints. Further, they attacked the general running of the business and the artistic integrity of Fry himself. Subsequently, the facts revealed the Four's allegations to be groundless but Fry declined to take any action, even though the circular was also sent to the press.

World War I brought mixed fortunes. At first Fry found it increasingly difficult to pay his artists their 30 shillings a week. The Workshops seldom paid their way. In contrast, by 1916 Fry noted that the bank balance had risen from £27 to £130. In an attempt to keep the Workshops both solvent and influential he instigated the Omega Club in 1917. It met once a week at the Fitzroy Square premises, putting on occasional plays and showing pictures. He found work for conscientious objectors and generally kept things going in increasingly difficult circumstances. But Fry was now relying on lesser talents after Vanessa Bell and Duncan Grant, both significant painters

in their own right, drifted away, out of sympathy with the muddled colours and formless designs then being produced.

Vanessa Bell moved to Charleston farmhouse, near Lewes in East Sussex, in 1916. Together with Duncan Grant she developed her own unrestrained, freehand ideas in interior decoration, with Charleston as a canvas. Employing a palette of greys, yellows, pale greens, lilacs and pinks they gradually decorated walls, ceilings, mantelpieces, doors and furniture. Much of this decoration was executed on an *ad hoc* basis with no formal plan or strategy. They experimented with a variety of cherubs, animals, flowers and loose geometric designs featuring Vanessa's distinctive circles and cross-hatching. They also designed needlepoint cushions, furnishing fabrics and carpets. The Charleston style of the 1920s and later represented a complete break with the work that Bell and Grant had produced for Omega. In place of bizarre animals and abstract geometric forms, the pair turned increasingly to a more lyrical vocabulary involving voluptuous figures based on characters from classical myths. This formula also proved more successful and they received many commissions for interior schemes including the decoration of Monks House owned by Virginia and Leonard Woolf (c.1924–28) and the Music Room installed in the Lefevre Gallery in 1932. While none of their later interiors survives, Charleston is now a unique record of Vanessa Bell's and Duncan Grant's decorative talents and a number of their designs have been successfully revived by the Laura Ashley Company in a range of fabrics and wallpapers.

Despite the loss of Bell and Grant, Omega gained new business at the end of the war. But it had almost come to the end of its useful existence. The exuberance and optimism personified by its products and designs were out of place in the austere post-war environment. Staff became ill, auditors complained of poor book-keeping and Fry had to settle various debts out of his own pocket. In March 1919 he gave up the unequal struggle and in June held a clearance sale at the Workshops. Fry watched as the public snapped up linens, pots and trays at half price. He had lost money in the pursuit of an ideal, but the impact of his ideas was to be far-reaching.

The essence of the Omega Workshops was patronage. Spurred on by the desire to communicate his artistic ideas and motivated also by his innate generosity, Roger Fry gave many young artists the chance to experiment, notably Henri Gaudier-Brzeska, Frederick Etchells, Edward Wadsworth and Wyndham Lewis. Together with Clive Bell, he presided over informed artistic opinion and criticism for much of the period between the wars – Clive Bell with his concept of “significant form” and Roger Fry with his deeply-felt dictum that “art illustrates life”.

NICHOLAS NUTTALL

Selected Collections

Examples of Omega Workshops products are in the Victoria and Albert Museum, London; the largest collection of decorative work produced by Vanessa Bell and Duncan Grant on public view (much post-dating the closure of the Workshops) is housed at Charleston, East Sussex. The Charleston Papers, containing correspondence by Roger Fry, Bell, Grant and others, are owned by the Tate Gallery (Archive), London; additional designs and archive material is in the Fry Collection, Courtauld Institute of Art, London.

Interiors

- 1913 Post-Impressionist Room, Ideal Home Exhibition, London (decoration and furnishing of a sitting room)
- 1914 Cadena Café, 59 Westbourne Grove, London (interiors including decorations and furnishings)
- 1914 1 Hyde Park Gardens, London (mosaic floors, stained glass and furnishings): Lady Campbell
- 1914 17 Bedford Square, London (mural decoration): Henry Harris
- 1916 4 Berkeley Street, London (mural decoration): Arthur Ruck
- 1916 Rossetti Garden Mansions, Chelsea (decoration and furniture): Lalla Vandervelde
- 1916– Charleston, East Sussex (decorations and furnishings): Vanessa Bell and Duncan Grant
- 1932 Music Room, Lefevre Ltd. Galleries, London (furnishings and decoration by Vanessa Bell and Duncan Grant)

Open-Plan

Open-plan abolished “rooms” and discovered internal “space”; becoming one of the most fundamental and revolutionary concepts to emerge from the Modern Movement in architecture in the 20th century. It turned buildings inside-out by considering the use of the internal space as an intrinsic aspect of the architectural design process, contributing to the fulfillment of a building's *raison d'être* rather than the superfi-

cial addition of internal decorative finishes. The emergence of open-plan is particularly significant in the history of interior design because it signals the point at which the interior was recognized as a key factor in determining the overall form of the building – when interior designing became part of the design process in its own right rather than mere “interior decoration” as an afterthought. Thus rooms gave way to “areas”; their linking was considered in terms of circulation and their location was worked out in relation to the mechanical services required by modern life. The relationship between areas linked within an open plan was made significant through an integrated decorative treatment rather than individual rooms as separate entities.

The construction of open-plan buildings depended on the reconsideration of conventional building types and methods of construction, greater use of glass and the elimination of walls in order to maximise internal space by opening it up to the outside in a more direct relationship. It marked the culmination of the technical development which enabled the spanning of large areas perfected in the 19th century by engineers for the construction of bridges, factories, and railway stations. No longer was there a need to depend on masonry and hand construction. The load-bearing properties of iron and concrete offered architects exciting new possibilities of treating the design of buildings as the enclosure and ordering of space according to a different type of logic. It was no longer necessary to conform to a “correct” interpretation of historical styling applied to traditional and vernacular forms of construction and conventional patterns of room arrangement and proportion.

Open-plan was also socially significant in a variety of ways. In theory it enabled greater consideration to be given by designers to the spatial arrangement of interior areas for the convenience and comfort of all its users. However the history of architecture has shown that in spite of the development of theories and technologies that have made this possible, the façade and external appearance of buildings are still often prioritised to the detriment of the interiors. Open-plan can also be seen to have reflected some of the social changes which allowed more intermingling of genders and classes by breaking down some of the boundaries between formerly rigidly gendered and socially-determined areas both in public and domestic buildings. Whereas social conventions had formerly determined a hierarchy of rooms in a society where everyone knew their “place”, open-plan suggested social mobility and a recognition that modern life meant having to adapt more flexibly to changing situations.

In popular house types open-plan developed from vernacular forms of working-class cottage dwellings which traditionally had a single living room, combined with a kitchen and the typical 19th-century town terrace with a kitchen / living room at the back and a little used parlour or “front room” kept for best. The social reform movement of the 19th century sought to effect its ideals through well designed working-class housing in the form of model cottages set in ideal villages. Reformers like Barry Parker and Raymond Unwin, working in the wake of Ebenezer Howard’s theory of the Garden City, carried out its ideals in house designs which favoured the all-in-one living room, eliminating the social pretensions represented by the middle-class parlour. This type of design was to form the basis

of modern public housing in Europe and the United States when the state undertook housing programmes to provide a better standard of accommodation for working-class families living in slums and for returning servicemen after the two world wars.

Open-plan came into common use in the first half of the 20th century together with the rejection of historical styles which accompanied the modern rational or “functional” approach to design. Ideally, the form was supposed to result from logical planning rather than aesthetic consideration in which stylistic or abstract composition was obtained by means of a sculptural arrangement of planes and ornamental features. The health and well-being of a building’s occupants were two of the most fundamental demands placed upon modern architectural design, be it factory, office or dwelling. This entailed the manipulation of the relationship of internal zones in terms of plan and volume, both to each other and to the outside with regard to quantity and quality of fresh air, sunlight and proximity to nature. The ideal form of open architecture eliminated dividing walls between rooms and sometimes floors between levels, it replaced solid external walls with glass, and created outside “rooms” and roof gardens as transitional spaces between the interior and the countryside.

The Swiss architect Le Corbusier’s concept of the *plan libre* was first introduced in a prototype for a low-cost worker’s dwelling based on the economics of mass production using pre-constructed standardised parts, as at the Pavillon de l’Esprit Nouveau at the Paris Exposition Internationale des Arts Décoratifs et Industriels Modernes in 1925. Among architects it became the classic model of the modern house and spawned several generations and countless adaptations of open-plan house and apartment design. It still exists today, reduced to its most common denominator – the now omnipresent front-to-back all in one living room. Le Corbusier’s idea of producing houses in the same way as cars motivated his much-criticised renaming of the house as “a machine for living in”. Later schemes of large multi-storey blocks such as *Unité d’Habitation* (1947–52), were blamed for inspiring the since reviled high-rise blocks of housing built all over the world during the 1960s.

One of Le Corbusier’s later designs for a housing estate, the *Quartiers Modernes Frugès* at Pessac near Bordeaux (1921–26) is a good illustration of how ideal design theory is rarely carried out in practice. His theories were applied to the instructions set by his client – Henry Frugès, the industrialist who commissioned him to provide “individual family houses” which would appeal to his local workforce. A subsequent study of the estate carried out in the late 1960s has shown the way in which the inhabitants closed off the open plan imposed by Le Corbusier’s purist design and adapted it to their own familiar vernacular conventions.

Another, quite different, example of a “classic” of the Modern Movement to incorporate open-plan as one of the main organising principles of its design, is the Schröder House in Utrecht, Holland, completed in 1926. Among the earliest examples of the use of the open-plan in domestic design, the Schröder House has been most often represented as an embodiment of De Stijl formalist concepts. Recent reinterpretations attribute its individual form to a mixture of new ideas and pragmatic design collaboration between the designer, Gerrit

Rietveld and the commissioning client Truus Schröder's preference for an informal lifestyle. The flexible space created by open-plan in combination with sliding partitions on the top bedroom storey and the first floor living / dining areas, responded sympathetically over time to the changing needs of a growing family.

The other architect also credited with the origination of the open-plan is the American Frank Lloyd Wright who first made his name through the design of what has collectively come to be known as the Prairie Houses, built between 1901 and culminating in 1909 with the Robie House in Chicago. Designed for individual clients, they are characterised by the free flowing use of space between the main living areas. Wright insisted on an "organic" relationship of the house to its surroundings so that the house and the garden were designed as one, and it was difficult to discern where the house ended and the garden began. He dissolved the separation of the outside from the inside, creating visual continuity by using large expanses of glass, taken up in the popular house idiom as the "picture window". The organic integration of the house to the site was achieved with strongly expressed vernacular building methods and the internal application of large-scale features and natural materials such as roughly hewn stone normally only used on the outside. Wright was also responsible for the design of the first open-plan office interior in his famous Larkin Administration Building in Buffalo, New York, completed in 1904.

The shortage of living accommodation following the two world wars stimulated house building programmes in the public and private sector and encouraged the most economic method of producing and using minimal space. Although open-planning was already seen in the more avant-garde Modern Movement inter-war period architecture, it was not until after World War II that it was more generally adopted. The most usual form it took in housing was created through the elimination of dividing walls between dining and sitting room. With the introduction of scientific methods of designing using anthropometrics and ergonomics to calculate the optimum use of space, open-plan became the logical answer to space shortage. This did not always necessarily mean the integration of the dining and sitting spaces. The larger dining / kitchen became an alternative sometimes used.

When it was first introduced open-plan was not well received by the general public. By mid-century, however, once domestic central heating became more generally available and the less formal lifestyles of the post-war period no longer considered a separate reception room indispensable for special occasions, it was accepted as the norm.

Open-plan had repercussions on the popular "Contemporary" style of interiors associated with the 1950s in which there was a rejection of the boxy, proportioned rooms and furniture prevalent in the period of austerity during and immediately following the war. The new style of interior design favoured horizontal, elongated lines in architecture and furniture. These features are reflected in the coffee table, a typical piece of furniture that became popular in the post-war domestic interior, which defined the focus of seating areas in the less specific living room which took over from the more formal lounge or parlour of the previous period. In the dining area the Victorian chiffonier and dresser gave way to a modern style of

sideboard sometimes incorporating a cocktail cabinet. Another new furniture type developed for use in the open-plan living room was the room-divider, a free standing double sided unit with shelves and cupboards usually placed between the dining and seating areas. Apart from the function of providing storage it helped to define the spaces without the solidity or permanence of a wall.

More recently there has been a return of interest in historical styles of interior decoration, featuring the fireplace once again as the focus of the living room but without giving up the comfort of central heating. Many a Victorian villa has rebuilt the wall which had once been demolished to make an open-plan modern living space.

Oppenord, Gilles-Marie 1672–1742

French architect and interior designer

During the great age of interior decoration in France, from the reign of Louis XIV to the Revolution, the foremost designers and finest artists and craftsmen spent more time and energy on wall ornamentation, fine furniture, metalwork, fabrics, porcelain and the like than at any other period in European history. The active building programmes of the monarchs, the nobility, and the wealthy encouraged architects, garden designers, painters, furniture makers, and sculptors to be innovative and productive. During the period from the end of the reign of Louis XIV through the early years of Louis XV's reign, Gilles-Marie Oppenord was one of the leading architects and interior designers in France. His reputation reached its zenith when he

Oppenord: section of the Salon d'Angle, Palais Royal, Paris, 1716-20

was appointed by the Regent of France, the Duc d'Orléans, as his chief architect and designer.

Unfortunately, very few of Oppenord's realized architectural or decorating projects remain; his most prestigious commission – the reconstruction and redecoration of the Palais Royal in Paris – did not even survive the 18th century. His work is well documented, however, through a large corpus of drawings and the three volumes of engravings after them published by Gabriel Huquier. Oppenord habitually explored his ideas for building and interior design in skilful, lively drawings. His predilection for drawing was developed during a seven-year stay in Rome, where his real education as an architect and designer took place. His Roman sketchbooks show that he not only studied forms of buildings and mouldings, but the sculpture, paintings, and other artifacts within the buildings or gardens as well. The architecture of Gian Lorenzo Bernini and Francesco Borromini influenced Oppenord in particular. His affinity for the Italian Baroque is reflected in his use of sculptural and figural motifs, in the rhythm and flow of movement in his ornament, and in the variety and liveliness of his designs. These qualities can be identified as his contribution to the development of French Rococo design.

Although Oppenord was not taken into the royal works on his return to Paris, he was able to obtain several commissions from ecclesiastical patrons. By 1714, however, his reputation had grown, and it was to Oppenord that Michel Bonnier, owner of the Hôtel de Pomponne, turned to redecorate his residence in the latest style. The carved wood panels that survive, along with two drawings, bear witness to the fertility of Oppenord's imagination. The large panels were richly and deeply carved with hunting trophies that combine naturalistic trees, dogs, and game with paraphernalia of the chase. The narrow side panels enclose a playful composition: Fame standing on a globe supported on a cloud that emerges from a tree that is suspended in the air by a fountain of water. The chimneypiece and mirror frame seen in the drawings exhibit forms typical of Rococo design – the shell motifs in the moulding that swirls at the top of the mirror, a grotesque head at its centre, the flourish of the moulding as it joins the mantel, and the double curve of the chimney. A narrow meander border on the wall behind the mirror introduces a rectangular, geometrical element that gives solidity to the total design, an indication of Oppenord's reluctance at this stage of his career to completely break out of the straight lines that define the wall.

When the Duc d'Orléans assumed his position of power as the Regent of France in 1715, he immediately engaged Oppenord to remodel the Palais Royal, his seat in Paris. The private apartments of the Duchesse and of the Duc himself were among the first to be changed. A drawing for the bed alcove (*lit de parade*) shows a fairly simple arrangement. The only ornamentation is confined to the bed hangings, the balustrade in front of the bed, and the two columns with composite capitals that extend to the full height of the room. The one innovation is the elimination of the entablature, cove, and cornice, substituting for them is a low hollow strip with a narrow decorated edge that allows the wall to extend to its maximum height.

Oppenord's changes to the Gallery of Aeneas (so-called from Antoine Coypel's ceiling paintings) were on a grander scale. He designed an oval hemicycle at the end, a great chim-

neypiece flanked by Corinthian pilasters at its centre. He placed on the marble mantel of the imposing fireplaces two large gilt bronze candelabra with putti holding palm fronds and irregularly spaced candle branches. Above the huge mirror, sculptured Victories pull heavy draperies aside, an example of Borromini's influence on Oppenord. The panels at each side of the chimney were decorated with full-scale gilded pyramids in relief. Within the monumental scale, however, the elegance and refinement of the individual elements, crisply delineated, contributed to the over-all dazzling effect. The multiplicity of the relief planes and the three-dimensional character of the decoration contributed to the liveliness of the design; the movement of light and shadow over the forms was enhanced by the mirror's reflections.

Oppenord was involved in the redecoration of the Petites and the Grands Appartements of the Palais Royal, and submitted designs for the stables that were never carried out. He made a daring proposal for a room, the Salon d'Angle that linked the state rooms and the gallery which was at right angles to them. It was to be two-storeyed, and elliptical in shape. The space dictated that the room would extend beyond the envelope of the building and overhang the street below. As in the gallery, the arch of the mirror above the fireplace penetrated the rectangular space above it. In the second storey, the pattern was repeated by the window arched at the top, a design innovation in France introduced here by Oppenord. The curves of the room, the window, the oval reliefs, and the mouldings provided fluidity, in contrast to the geometrical lines that had been dominating French design. In the end, the idea was abandoned because of lack of confidence in the security of the overhang.

The same inventiveness in decoration, but in a lighter and more informal style, can be seen in Oppenord's work for Pierre-Nicolas Gaudion at the Château de la Grange-du-Milieu about 1720. For the salon, he used oval medallions with elaborate frames to ornament the wall panels, one of his favourite devices. In this case, they were made to hold paintings that were executed although they no longer exist. The rhythmic pattern of the salon wall panels contain decorative motifs favoured by Rococo artists, such as bats' wings, dragons, shells, and fantastic creatures holding vases of flowers. A decade later, Oppenord designed a hôtel in the Marais in Paris for this financier, who by this time had become the Garde de Trésor Royal. The plan was not unusual, but the decoration with sculptured urns, classical figures, playful putti, and fantastic creatures of all sorts, along with delicately fashioned ironwork is signature Oppenord.

In addition to his designing entire structures, and his close attention to every aspect of their interior decoration, Oppenord was obviously also involved in designing certain of their individual furnishings. Chimneypieces, chandeliers, clocks, regulators, candle stands, sconces, mirrors, and frames appear in profusion in his drawings and prints. His designs have been linked to furniture made by the royal cabinet-maker André-Charles Boulle and to pieces by Charles Cressent, the Regent's cabinet-maker.

Oppenord's reputation as a builder was eclipsed by his fame as an interior designer. He drew upon a vast personal vocabulary of ornamental motifs, some based on his experiences studying Italian prototypes, and others simply the outpourings

of his fertile imagination, to produce interiors that were varied, elegant, and lively. The plasticity of his ornament, while never losing its vitality of line, brought a freedom of spirit to French interior decoration.

ELAINE EVANS DEE

Biography

Born in Paris, 27 July 1672, the son of the Dutch craftsman Alexandre-Jean Oppenord (died 1715), cabinet-maker to Louis XIV. Trained with his father, and then under the architect Jules Hardouin-Mansart (1646–1708). A protégé of Edouard Colbert, Marquis de Villacerf, Surintendant des Bâtiments de Roi, Oppenord also studied at the French Academy, Rome, 1692–99. Married Antoinette Bérard, 1701. Active as an architect and designer in France from 1699; designed notable interiors from 1714. Appointed Premier Architecte to Philippe, Duc d'Orléans (1674–1723), 1715, and appointed director general of buildings and gardens. Chief architect, St. Sulpice, Paris, 1725–31. A large collection of his drawings was published in three series by Gabriel Huquier between 1737 and 1751. Died in Paris, 13 March 1742.

Selected Works

Collections of Oppenord's drawings are in the Staatliche Kunstsbibliothek, Berlin; the Cooper-Hewitt Museum, New York; the Musée des Arts Décoratifs, the Ecole des Beaux-Arts, and the Musée du Louvre, Paris; and National Gallery, Stockholm. Many of Oppenord's designs for interiors are also reproduced in engravings (see below).

Interiors

- 1714 Hôtel de Pomponne, Paris (interior): Michel Bonnier
- 1716 Palace, Bonn (designs for doors, panelling and chimney-pieces): Elector Clement Augustus of Cologne
- 1716–20 Palais Royal, Paris (remodelling and interiors including the Grand Apartments, gallery, Cabinet en Lantern and Salon d'Angle): Philippe, Duc d'Orléans
- 1719–20 Hôtel d'Assy, Paris (salon): Jean-Pierre Chaillou
- c.1720 Château de la Grange-du-Milieu (salon): Pierre-Nicolas Gaudion
- 1723–30 Hôtel Crozat, Paris (remodelling and interiors including the gallery): Pierre Crozat
- 1731–49 Hôtel Gaudion, Paris (designs for the building and interiors): Pierre-Nicolas Gaudion

Orientalism

Orientalism made two very particular and valuable contributions to the Western interior, private and public. First, to designers tiring of classical rules it offered unique imaginative excitements. A vaguely-understood "Orient" had long stimulated the Western mind, evoking such responses as Chinoiserie. This fantasy appeal would continue. But second, serious study from the later 18th century onwards of a variety of oriental cultures, especially those of Islam – a study which became known as "Orientalism" – enabled basic aspects of Western interior design, such as room-shape, colour-deployment and furnishing, to be rethought.

European interest in Islamic traditions, as in those of China earlier, was encouraged by Europe's own restless needs. As the old 18th-century autocracies gave way to the social revolutions of the 19th, the oriental styles could serve different purposes. Before 1700, at the height of Louis XIV's reputation as Sun King, a plan to have interiors at the Louvre palace in the national styles not only of Europe but also of Turkey, Persia, India and China, as if to bring the whole world to France, was being discussed. It was unrealised: but European desire to turn Eastern art to account remained. Two centuries later, in the changed world of the 1880s, old Western ideas of oriental countries as faraway paradises could look even more attractive against the drab constraints of contemporary cities: Chinese, Indian, Persian, Moorish and Turkish rooms at New York's Hoffman House Hotel, it was claimed, could provide guests with the nearest experience to an actual journey east.

Many genuine Islamic interiors, notably those of mosques, were by tradition hard of access to non-Muslims. Soon after

1700, however, Turkish society was being observed by such figures as Lady Mary Wortley Montagu, living in Constantinople. Ottoman Turkey, no longer a military threat to the West, was inviting fresh interest. A Rococo "Turkish" tent, such as that at Vauxhall Gardens, London (1740s), might provide a merely fanciful interior for dining in after dark. But French Rococo furniture was engaging the tastes of Turkish sultans; and the artefacts of Turkey were gaining passionate admirers in Europe. The Turkish word "kiosk" lent itself to Western garden buildings. Trade, notably along the Danube, brought in items of Turkish furniture such as sofas, ottomans and divans. The sofa, unfamiliar enough in 1692 to need definition as "a form of day-bed ... used by the Turks", developed S-shaped ends (continuous with seat-rail) and made an easy conquest of Rococo taste. The upholstered *ottomane* couch, strongly contrasting with squared Italianate forms, became popular in France by 1750 and, with the divan, ubiquitous in the next century.

Not uncommonly, as the 18th century progressed, informal Turkish rooms might be included in Western buildings which were otherwise severely classical: as at Fonthill (Wiltshire, England), completed by William Beckford's father in 1768. Beckford himself included a "Turkish Salon" in plans for a house at Lisbon in 1793. Garden settings might be preferred: in Germany a "divan room in the Turkish taste" was illustrated in Johann Grohmann's *Ideenmagazin für Liebhaber von Gärten* (Leipzig, 1799). Here, beside a bolstered divan, rose a standard with a crescent and five horsetails: little, in truth, to evoke authentic echoes of the Ottoman Sultans, but enough to provide a reminder, perhaps, of a Turkish visit. Having travelled in Turkey in 1787, the art connoisseur Thomas Hope gave his so-called "Indian Room" (1800, at his Duchess Street mansion in London), a "Turkish" ceiling, with a pattern of trellis or reeds joined by ribbons: imitating, as he declared in his *Household Furniture and Interior Decoration* (1807), "Turkish palaces".

Between 1800 and 1820 interest in the culture of ancient Egypt also had repercussions in Western interiors, notably in Hope's Duchess Street "Egyptian Room", and in furniture by Hope himself, Percier and Fontaine and other French designers. Maria Edgeworth refers vividly in her novel *The Absentee* (1812) to "Egyptian hieroglyphic paper, with the ibis border ... one sees it everywhere ...". Adaptable for entrance halls and libraries, the solemnity of the ancient Egyptian style made it less suitable for informal rooms, where Islamic coloured tile, stained glass and carved wood were to excel. The Islamic interiors of modern Egypt (then part of the Ottoman Empire) were steadily documented throughout the century by Western artists, architects and scholars, including E. Prisse d'Avennes, long settled in Cairo and author of the influential book *L'Art Arabe d'après les Monuments du Kaire* (Paris, 1877).

The interest of Romantics such as Samuel Taylor Coleridge and Victor Hugo in the Moors of North Africa, who had ruled in Southern Spain between the 8th and the 15th centuries, was extended as travellers, writers and painters explored Spain and Morocco after the Napoleonic Wars. The 14th-century courtyards and reception halls of the Alhambra, the Moorish fortress-palace of Granada (Southern Spain), became a focus of close attention. To Western tastes accustomed to continuous, basically homogeneous walls and "contained" spaces, Moorish

effects were refreshingly open and fluid. Though pointed arches suggested affinities with Gothic, the Alhambra rooms were a revelation, with their slender columns supporting arcades perforated by infinitely-varied, stuccoed patterns; and dadoes brilliantly coloured with tile. First-hand study of the building in the 1830s led to important publications by Girault de Prangey (1836–39, 1842) and especially by Owen Jones (1842–45). Visiting artists such as David Roberts and John Frederick Lewis drew interior views. Washington Irving's book *The Alhambra* (1832) brought its history and legends to life for a large readership. Jones, an architect with strong interests in colour, noted how the bright, intricate Alhambra patterns, based on geometrical grids, related colours in proportioned ways that produced overall stability and repose at a distance. He adapted this thinking in his use of primary colours on the uprights and horizontals (and arabesque spandrels, finally omitted) of one of the most discussed of all 19th-century interiors, the Crystal Palace in London (1851).

Moorish example, aside from Jones's strenuous advocacy in his own designs, and his writings, was also advanced through the international study of architectural polychromy, which included 12th-century Moorish building in Sicily. The polychromatic interior of Ludwig von Zanth's Villa Wilhelma (1842–46), Cannstadt, near Stuttgart, built for the King of Württemberg as a personal retreat, skilfully suggests the notion of space beyond space, glimpsed through a sharply-profiled arcade or perforated screen, which was a fundamental part of the contemporary appeal of Muslim, and especially Moorish, architectural style in the West.

While Nash's fantastic Royal Pavilion, Brighton (1815–22) gave incomparable glamour to Indian stimulus (though its interiors were "Chinese"), precise knowledge of Indian art and architecture, in both their Islamic (Mughal) and Hindu forms, had been growing since British rule was imposed in India in the 1760s. It was assimilated through the international standing of the aquatints in Thomas and William Daniell's *Oriental Scenery* (1795–1808). In Western interiors Indian motifs were often first applied to buildings less formally restricted by convention, such as conservatories and bazaars. In 1829 Albert Schadow designed a conservatory at Pfauinsel (Peacock Island), Berlin, with a "Mughal" interior in which space, splintered by palm-fronds, was further broken down by scalloped arches. In 1834 Charles Bielefeld produced a papier-mâché "Mughal" screen for Sydney Smirke's Bazaar and Pantheon in Oxford Street, London. In New Haven, Connecticut, Henry Austin designed villas with Mughal and Hindu detailing (1840s–60s).

As industrialization promoted the machine in the ordering of Western life, Indian, Moorish and other craft-based oriental traditions were taken up by designers reacting against the uniformity of industrial mass-production. Besides the publicity afforded by Owen Jones's compendious *Grammar of Ornament* (1856) and books that it influenced, other general works offered specific guidance on the use of Eastern artefacts in private houses. Charles Locke Eastlake's *Hints on Household Taste* (1868) extolled the hand-wrought vigour of Islamic rug designs and Moorish pottery. Its many transatlantic editions influenced American works such as Harriet P. Spofford's *Art Decoration Applied to Furniture* (New York, 1878).

Orientalism: Villa Wilhelma, Cannstadt, near Stuttgart; plate from *La Wilhelma* by Ludwig van Zanth, 1855

The Aesthetic Movement of the 1870s and 1880s gave prominence to new design firms which marketed Eastern goods and incorporated oriental ideas into the designing of interiors. Liberty's of London, besides selling Persian and Indian fabrics, Koran stands and small tables imported from Cairo, supplied their own Moorish-style carved woodwork and furnishings for the Arab smoking- and billiard-rooms which became fashionable. The firm's design studio produced schemes ranging from such influential interiors as the Earl of Aberdeen's "Indian room" (1888) in his Grosvenor Square house – this had horseshoe arches and old Persian tiles – to the "Damascus niches" and "cosy corners" which, with sofa, cushions and tent-like canopy, became a minor rage in more modest homes on both sides of the Atlantic (they were taken up in America by Mrs. Spofford and other writers).

In New York L. C. Tiffany operated, with others, the studio known as Associated Artists, which designed interiors – some strongly oriental – from 1878 to 1883. Several appeared in George Sheldon's publication *Artistic Houses* (New York 1883–84), among them the saloon (1879) of George Kemp's house on Fifth Avenue, with tiled panels, grill-like partitions, Moorish columns, Persian fabrics and Japanese Imari vases.

The decorative woodwork was by Lockwood de Forest, who from 1880 ran a shop in Ahmedabad, India, to supply authentic ornament for Tiffany. In William S. Kimball's house (Rochester, New York, 1881) pierced wooden panels copied from stone screens at the Sidi Sayyid mosque, Ahmedabad, divided main hall from staircase.

The international exhibitions of the day played an invaluable part in familiarizing Western publics with Islamic effects: sometimes whole interiors were shown. Having designed the Indian Pavilion for the 1878 Paris Universal Exhibition, the architect Caspar Purdon Clarke reproduced for the 1886 India and Colonial Exhibition, in London, an Indian palace with a durbar or audience hall (surviving in altered form at Hastings Museum and Art Gallery). The superlative wood-carving was the work of two Punjabi craftsmen.

Orientalism's grandest results in domestic interiors came between 1870 and 1900. In Britain, the Arab Hall (1877–79) by George Aitchison, at the Kensington home of the painter Lord Leighton, incorporated Koranic inscriptions, old Syrian and Iznik tiles and lattices from Damascus. In his Arab Room (1880–81) at Cardiff Castle, for the fabulously wealthy Marquess of Bute, William Burges conjured a dramatically-

Orientalism: Indian Room or boudoir at Ashley Place, London, by H. & J. Cooper, 1893

faceted ceiling that rose to an eight-pointed star. In France, Charles Dupire-Rozan designed at Tourcoing, near Lille, the vast, Indian-style Château Vaissier (1892) for a soap manufacturer, with "blue", "green" and "red" rooms, and a hall with sculpted gods. In America the painter Frederick Church built his house Olana (1870–72) above the Hudson, with Calvert Vaux as consulting architect: a studio wing was added in 1888–89. The main style was Indo-Persian: stencilled patterns inside were based on examples illustrated in Jules Bourgoïn's book *Les Arts Arabes* (Paris, 1873).

Islamic architectural styles had a role in many Western public buildings also. Moorish or "Saracenic" was a frequent if unexpected choice for synagogues, where it represented a Zionism intent on emphasizing its non-European origins. Gottfried Semper's synagogue interior at Dresden (1839–40, destroyed) was an influential example, the painted interior of Leopold Eidlitz's Emanu-El Synagogue, New York (1866–68, demolished 1927) an important successor in America. But it was in Western hotels, restaurants and theatres that the departures of Islamic styles from "normality" made them an agreeable choice for interiors designed for short-term relaxation or recreation. J.A. Wood's Tampa Bay Hotel, Florida (1891) became a kind of Moorish dream-palace; Frank Matcham's theatres (Empire Palace, Edinburgh, 1892, demolished 1911; Grand Opera House, Belfast, 1895) similarly suspended disbelief. Museum designers also used these styles: with its "Mughal" foyer, Odon Lechner's Museum of Decorative Arts, Budapest (1891) could delight as well as instruct.

The orientalizing interior's success in theatre, tearoom and hotel provided its only growing point in the brisker 20th century, when it otherwise lost ground. Two buildings of 1929, the Fox Cinema, Atlanta, Georgia, by Marye, Alger and Vinour, with its Cairene echoes, and the Civic Theatre, Auckland, New Zealand, by C.H. Bohringer, with a "Hindu" foyer and "Moorish" auditorium by Arnold Zimmermann, preserved undiminished what had always been a strength of such interiors, private or public: the power to manipulate illusion.

Orley, Bernart (or Bernard) van c.1488–1541

Flemish painter and tapestry designer

Best known as a painter of historical scenes and portraits, Bernart van Orley also made his mark as a designer of tapestry and stained glass. The designs of the best tapestries made in Brussels during the period 1520–40 are attributed to him, and

Orley: *Hunts of Maximilian* tapestry, Brussels, c.1538

he is credited with influencing most of the historical tapestry subjects woven in Brussels during this period.

During the 16th century Flanders tried to recover from the effects of war and regain its position as the center of Europe's tapestry trade. The influence of Italian painters, most notably Raphael, was moving northward into the Low Countries. The role of the artist became increasingly more important and caused a revolution in tapestry design. Tapestries soon became woven versions of paintings. Cartoons became more detailed as shape, tone, and color were established by the artist rather than being left to the interpretation of the weaver.

Van Orley was in the forefront of this movement, and of the artists who disseminated the Italian style through the Flemish tapestry workshops he had the greatest influence. As a disciple of the Italian school of painting, he was skilled in technique and had mastered the science of perspective. His art is characterized by refined drawing, use of complex architectural detail and ornamentation combined with distant views of hills and countryside, bizarre costumes, and careful delineation of large, robust figures of men and women, which show a very good understanding of anatomy. He is credited with introducing attributes of class, position, and wealth to Flemish work.

In Brussels van Orley supervised the *Acts of the Apostles* tapestry series depicting deeds in the life of Christ and the Apostles that had been ordered by Pope Leo X for the Sistine Chapel and woven by Pieter van Aelst from Raphael's cartoons

in 1519. This series greatly enhanced the reputation of the Brussels workshops. The work was carried out under the control of van Orley, apparently assisted by Tomaso Vincitore, who helped Raphael prepare the ten cartoons. The greatest changes in decorative style are in the Greco-Roman "grotesques" of the borders, inspired by the craze prevalent among Italian princes for decorating certain rooms of their palaces to resemble grottoes. These became the inspiration for French and Flemish borders from the 16th to the 19th centuries, replacing the traditional floral borders. This series was the beginning of the revolution in tapestry design in which the artist took over creative control from the weaver, and it was rewoven many times.

However van Orley's Flemish background came to the forefront in the power and idealism expressed in *Hunts of Maximilian*, or *Great Hunts of de Guise*, a 12-part tapestry series woven by François Geubels at the request of the Regent of the Netherlands, Mary of Hungary, sister of the Emperor Charles V. In this work, the subject of which is based on themes popular in the 15th and 16th centuries including the story of King Modus and Queen Ratio, the painter adopted a realistic and natural style. He interpreted the subject in a typically Germanic spirit in contrast with the overwhelmingly Italian style of the earlier tapestries. The 12 parts of the series represent the months of the year, with feasting and chases after stag and boar over vast stretches of countryside. The scenes are

packed with richly costumed people and realistic animals and have a wonderful vitality with vibrant reds, greens, slate grays, pastel blues, and russet tones. Michael Wauters in *Les Tapisseries Bruxelloises* (1878) described the tapestries as very compact in pattern with well-modulated colors giving unity to the whole piece.

The *Trials of Job* based on van Orley's painted triptych, again shows the influence of Italian art. The naturalistic northern tradition present in the *Hunts of Maximilian* was replaced by a feeling of monumentality based on predominantly architectural elements in the Italian style. Eight of these tapestries are now at Hampton Court.

CONSTANCE A. FAIRCHILD

See also Tapestries

Biography

Born in Brussels, c.1488; the son of the painter Valentin van Orley. Trained with his father. Married Agnes Seghers in 1512. Painted altarpieces from c.1512 (*Job* or *Virtue of Patience* altarpiece dated 1521) and portraits from 1515; master of the Guild of St. Luke, Antwerp, 1517; court painter to Margaret of Austria, Regent of the Netherlands, from 1518 and to her successor Mary of Hungary, 1532–35. From mid-1520s chiefly involved in tapestry and stained glass (St. Gudule, Brussels), though he headed a leading painting workshop. Died in Brussels, 6 January 1541.

Selected Works

Tapestry series designs include: *Passion* series, 1520s; *Legend of Notre Dame du Sablon*, 1520s; *Founding of Rome*, c.1524; *Battle of Pavia*, c.1525; *Story of Abraham*; *Genealogical Portraits of the House of Nassau*; *Story of Jacob*, c.1528; *Hunts of Maximilian*, c.1538.

Ormolu

The word *ormolu* originally derived from the French words for molten gold (*or moulu*), but it has since become a generic term for the mounts that embellish the casegoods, clocks, and accessories of 18th-century France and her European imitators. The French themselves refer to such pieces as *les bronzes d'ameublement* or, more simply, *les bronzes*. The decorative

form of these mounts was inseparable from their function and, whether used as escutcheons, handles, ferules or trim, they always emphasized the line of the piece, and often provided protection for its vulnerable edges and surfaces. The finest examples were fire-gilt with mercury, a technique that appears to have developed as French cabinet-makers sought to compete with André-Charles Boulle, one of the first to combine woods and metals. As little ormolu was produced outside of France – Matthew Boulton of Birmingham was one of the few English manufacturers – this discussion focuses on French techniques.

A "bronze" began as a drawing, which a sculptor translated first into a wooden model, and then into wax for casting. Because of the expense of design development, moulds were re-used and designs repeated; and the threat of legal action against artisans working outside their guild-regulated specialties ensured that few cabinet-makers concerned themselves personally with the mounts that would decorate their work. An exception was Charles Cressent, fined in 1723, 1735, and 1743 for modelling and even attempting to sculpt his own bronzes. Jean-Henri Riesener, who followed Cressent's example, managed to escape such retribution. Although cabinet-makers were not legally permitted to model, cast, or gild the mounts decorating their work, they were permitted to set them in place. Unskilled in metalwork, however, they often left the heads of the copper nails and wood screws exposed rather than camouflaging them, as did Cressent, by a leaf or within an arabesque. Others followed Cressent's lead, and techniques improved after 1760.

Casting was the official province of the *fondeur-ciseleur*, who was also allowed to simulate a gilded finish by cleaning the metal with acid and lacquering it to prevent oxidation, or by applying one of the "gold" varnishes that were used from the late 17th century onward. Although these contained no gold, they not only simulated its appearance but were hard, transparent, and acid-resistant. Such finishes were reported by the French press throughout the 18th century. In 1772, for example, the *Almanach sous verre* announced that the craftsman Nicolas-Pierre Severin possessed "the secret of an English varnish" that gave the look of gold to copper. His formula may have been similar to that published by the same journal in 1790: an infusion in alcohol of amber, saffron, and the dark resin called "dragon's blood."

If gold itself were to be used, the item was sent on to a *ciseleur-doreur* (less often, to a goldsmith). *Ciseleurs-doreurs*, who were permitted to gild but not cast, specialized in the fire-gilding process that used heat to fuse gold dust, ormolu, or up to eight layers of gold leaf to the surface of metal. Of the three approaches, ormolu was preferred for fine pieces because of its durability and bright color.

The metal was prepared for this treatment by being soaked in a weak solution of nitric acid mixed with a handful of wood ash and a pinch of salt. It was then dried with sand or sawdust, rubbed with a wire brush, painted with a second solution of nitric acid, rinsed in several changes of clear water, and polished with a chamois.

The ormolu itself was an amalgam of one part of gold to six or eight of mercury, which assured a fluid consistency. After being stirred in a heated crucible, the mixture was rinsed several times in clear water, and squeezed through a chamois to eliminate any quicksilver that had not bound with the gold.

It was applied to the metal with a fine wire brush, and covered with two layers of gold leaf tamped down with cotton. This was allowed to drain for about an hour before being placed in a metal basket and heated on a grille over a charcoal fire, one to two minutes on a side. The piece was tapped frequently as it heated in order to distribute the ormolu evenly over its sculpted surface; and additional ormolu and gold leaf were added as needed. According to the *Encyclopédie* (1751–65), the process might be repeated up to four times until, on the finest pieces, the gold was as thick as a fingernail.

Because the metal was whitish or pale yellow when it emerged from the fire, it was rubbed with coloring agents, such as jeweller's rouge or vermilion dissolved in urine or vinegar. It could also be left in a mixture of tartar, sulfur, salt, and water until the desired hue was attained. As a last step, it was burnished with a bloodstone. Both color and finish evolved over time. Late Baroque metals were slightly greenish and smoothly burnished; the Rococo period preferred rosier tones and a finish in which burnished areas contrasted with a matte background. The late 18th century favored a yellowish gold, but retained the Rococo play of matte and sheen.

The cost of the material was high. An article in the supplement to the *Encyclopédie* (1776–77) reported that "Ormolu costs 104 livres the ounce, while gold leaf costs only 90." It was expensive in other ways as well. The article concluded by saying that "The use of mercury in ormolu means that the gilders are subject to stiffened joints or at least to the trembling caused by the effect of the mercury vapor." The earlier English *Cyclopaedia* (1738) had been more straightforward: "The gilders are but too well acquainted with the vapours of mercury, which frequently render them epileptic, and paralytic, and sometimes salivate them [i.e., cause them to drool]; being of so penetrating a nature, as to take away any scirrhus [cancerous] tumours, though very apt to reach and destroy the nobler parts."

The *fondeurs* and *ciseleurs* whose work often defines the furnishings of this period are often less well known than the cabinet-makers with whom they collaborated. Among those

who are justly celebrated are Etienne Forestier, who worked with Jean-François Oeben; his son, Pierre-Auguste Forestier, was employed by the crown and the Prince de Condé, and established a successful workshop after the Revolution; Jacques Caffiéri, who collaborated with Oeben and Antoine-Robert Gaudreau, and was commissioned to execute a bronze frame for the astronomical clock made by Claude-Simon Passemant for Louis XV; Pierre Gouthière, employed by the crown in the 1770s, and by such patrons as the Duchesse de Mazarin, for whom he executed the mounts for a table of blue marble designed by the architect Bélanger; Pierre-Philippe Thomire, who was employed by the Sèvres porcelain factory, collaborated with Jean-Guillaume Beneman, worked for both Louis XVI and Napoleon, and established a workshop that employed some 800 craftsmen. The names of others can be found in the royal accounts, among them Oeben's collaborators, the *fondeurs* Duplessis, Herrieux, and Guinard, and the *doreurs* Briquet, Fagard, and Jubert.

P

Paint: Colour and Finishes

Paint is an ephemeral medium, vulnerable to the ravages of time, the effects of wear and tear, and the vagaries of changing fashions. The study of painted decoration and historic colour schemes is therefore a somewhat elusive subject that must rely heavily upon second-hand sources such as inventories, illustrations and written accounts. Yet even in the absence of surviving examples, the evidence of such sources shows that paint has proved enduringly popular as a means of decorating interiors since ancient times. And if the ingredients of paints themselves remained largely unchanged until the 20th century, the ways in which they have been applied has varied hugely across different periods and ages.

Some of the earliest references to the use of paint within interiors date from the Classical Greek period. Pliny the Elder noted that famous artists such as Apelles, court painter to Alexander the Great, used a limited palette consisting of white from Melos, Attic yellow, red from Sinope, and black, and these colours were probably also used for wall decoration. It is thought that the walls in pre-Hellenistic interiors were painted in tempera, using a binding pigment, in bright reds, yellows or white, which formed an uncluttered backdrop to furniture. Red was the most popular colour: the walls of the atrium House of the Bicentenary at Herculaneum, for example, were painted red as a dramatic complement to the black and white mosaic floor. If the wall was divided into horizontal bands with a dado, main field and cornice, the dado was usually white or yellow and the main field was red. In the so-called “masonry style”, the plaster walls were modelled in relief to imitate masonry blocks and these were then painted in bright colours, as in the House of Dionysos at Delos.

Roman decorative schemes were even more striking and ambitious. The earliest phase of decorative painting, known as the first Pompeian style, developed in the 2nd century BC and involved the *trompe-l'oeil* representation of marble and masonry slabs. During the Augustan period (27 BC–14 AD), styles became more illusionistic, incorporating large-scale wall-paintings of landscapes, human figures and mythological fables. Examples such as the Cubiculum from a villa at Boscoreale (c.50 BC, now in the Metropolitan Museum of Art) and the paintings in the Villa of the Mysteries, Pompeii (c.50 BC) illustrate the mastery of fictive architecture, the human figure, and three-dimensional space and attest to the

increasing sophistication and complexity of mural schemes. They also demonstrate the colouristic brilliance of Roman interiors which favoured deep reds and vivid greens and blues. Such was the complexity of composition and colour in murals towards the end of the 1st century AD that both Pliny and Vitruvius expressed concern that artistic integrity might be sacrificed in the pursuit of overly-capricious and self-consciously fanciful treatments.

Byzantine interiors, though richly furnished and extremely opulent, favoured mosaic and tapestries more than fresco and plain painted effects. Comparatively little is known of their Northern European counterparts but it is generally thought that few early medieval domestic residences had elaborate fixed decorations. Castles and palaces were heavily fortified during this period and the peripatetic lifestyles of great lords and their retinues encouraged the use of furnishings and decorations that could be easily dismantled and moved to wherever the court was in residence. The great hall in a princely house was the political, administrative and social centre of the household and all its members who, with the exception of the lord who had his own quarters, slept and ate in this communal space well into the 11th century in England and even later in other parts of Europe. Thus, whereas the treatment of walls in service quarters was generally utilitarian in character, in medieval halls rough surfaces were unacceptable and the walls were plastered. The brickwork around doors and windows was sometimes left exposed, and walls were decorated with a white or coloured wash consisting of powdered chalk and water, and were sometimes painted with red horizontal and vertical lines to imitate the daub in the plastered brickwork. White was of paramount importance not only because of its symbolic significance but also due to its visual brilliance and its practicality as a reflector of light and whitewashed interiors were frequently refreshed, especially for special ceremonies. In England, for example, Westminster Hall was freshly whitewashed in 1274 for Edward I's coronation, and in 1337 the Tower of London's walls were given another coat of whitewash to contrast with the internal timber posts which had been newly painted in size and ochre. Plaster of Paris, which was finer than the coarser lime, sand and hair mixture, was also popular in wealthy households. Initially this was brought from Montmartre near Paris, but after gypsum was discovered in Corfe in Dorset this practice was no longer necessary, and

Paint: finishes in the showroom of J. Warnrop & Sons, Liverpool, 1890

when Windsor Castle was decorated with plaster of Paris in 1312 local supplies were used.

During the later Middle Ages, as European society became less turbulent and more prosperous, the defensive character of domestic architecture lessened and more permanent households were established. Interiors were more richly decorated and wall paintings dominated princely residences during the 13th and 14th centuries. The paintings executed in 1343 for the bedroom and study of Clement VI in the Palais des Papes at Avignon represent supreme examples of the French secular style of decoration. The bed chamber is painted with a simulated curtain hung from rings at the lowest level and above it rises a large expanse of vine scroll upon an azure background containing numerous birds with distinct and brilliant plumage. The study walls illustrate forms of hunting, with many figures in a forest of slender trees and precisely observed forest flora. Charles V of France and Henry III of England commissioned elaborate schemes of history paintings for their palaces and on a somewhat simpler level, Henry III also delighted in a decorative scheme involving green spangled with gold which he used in many of his great houses. His chamber at Guildford, Surrey (1256), had a green ceiling spangled with silver as well as gold, combined with white walls painted to imitate masonry.

Masonry painting was also used by the Comtesse d'Artois at the Château d'Hesdin, together with blue or green ceilings with metal stars. Stencilled patterns, often incorporating heraldic motifs, were also common throughout Europe during this period, although during the 14th century hangings of various silks, tapestry and worsted and wood panelling began to replace painted walls in colder climates.

The use of illusionistic fresco painting reached its zenith in Mediterranean countries, specifically Italy, and the history of this subject is so vast that it is not possible to do more than touch upon it very briefly within this survey. At the beginning of the 15th century, the walls in grander types of Italian houses almost invariably had a painted pictorial frieze, the rest of the wall being left plain. Dadoes and skirtings were introduced c.1430 although the frieze still tended to remain the dominant feature. By the 16th century the main field of the wall was also decorated, often with large painted scenes, and from 1550 virtually every part of the ceiling and walls in important rooms was covered with complex figurative scenes. Throughout this period, however, much fresco painting also included regularly spaced repeating patterns. Lozenges, chequers or stripes were favoured in the 14th century, while imitation textiles featuring striped and sprigged patterns and figured silks were popular in

the 15th century (Thornton, 1991). The depiction of fictive architecture came into fashion in the 16th century, a trend exemplified in Baldassare Peruzzi's painted Hall of Columns in the Palazzo Farnesina in Rome (c.1516). And the excavation of ancient Roman sites from around the same period revealed a vast repertory of classical ornament, including candelabra and grotesques, that were adapted in Italian wall decoration (notably in Raphael and Giovanni da Udine's work in the Vatican loggie and the Villa Madama, Rome) to suit contemporary tastes.

Although mural painting was not uncommon in wealthy and even more humble dwellings in Northern Europe, it was not used either as extensively or in as accomplished a fashion as in Italy, and it tended to be executed by journeyman painter/decorators as opposed to artists. These painter / decorators also specialised in the stencilled pattern work and decorative paint effects that proved especially popular in parts of Britain in the 14th, 15th and 16th centuries. Over 200 houses – ranging from manor houses to cottages – containing decorative wall treatments have been documented in Essex alone.

The simplest option in many of these houses was to use a plain white or colour wash on the walls. Broad vertical stripes could be superimposed in a contrasting colour, with a decorative border along the skirting and ceiling acting as terminals to the stripes. Where vertical wooden beams were left exposed, the wall space between them was “arcaded”, with painted arches linking the tops of the beams to suggest an arched colonnade. Other flat patterns such as zigzags, chevrons and diapers were used to create patterns of greater complexity. Simple floral motifs were also favoured, as was the incorporation of text, usually of a didactic nature, into decorative schemes.

Walls were also painted to imitate more expensive wood panelling. At Sutton House in Hackney, *trompe-l'oeil* panelling embellished with bright blue and red paint survived for centuries under plain wooden wainscoting applied at a later stage over the paint work. A less refined example of imitation panelling is at Cromwell's House in Ely (1572) where the panels are grained in red and brown between blue painted “rails” and “posts”. Each panel also features a black arabesque ornament at its centre, possibly to simulate an ebony inlay.

Real wainscot, generally made of deal, oak, spruce or pine, was also often painted, and between the 13th and 15th centuries it was usually devoid of any architectural detail so as to provide a flat surface for painted decoration. In the 13th century green was a popular but expensive colour for this purpose and examples include the Queen's chamber at Woodstock and the Antioch chamber at Clarendon in Wiltshire where the green wainscoting was also embellished with gold spangles. The wainscoting in the Queen's chamber in the Tower of London was painted white and decorated with roses.

The price of paint was determined by its colour, and this had a huge bearing on the cost of painting an interior. All paints were made with natural (animal-, vegetable-, and mineral-derived) pigments, the scarcity of which contributed to their expense. Up until the 20th century, two paint types were persistently and predominantly used for interiors: vegetable, oil-based white lead paint to which colour pigment could be

added – this was most often used for internal walls and masonry, wood and ironwork – and distemper, a lime or chalk-based water soluble solution that was cheaper and that could be sponged off a surface prior to repainting. Distemper was especially useful for the large expanses of wall above the wainscot, and for decorative mouldings as, unlike white lead, it did not clog up the relief work.

The production of white lead for paint remained unchanged over many centuries. To achieve the mineral necessary to make white oil-based paint, sheets of lead had to be immersed in vats of vinegar, causing the lead to corrode. The white corrosive residue or chalk was then scraped from the lead and mixed with an oil – usually linseed, olive, walnut or poppy seed – and the appropriate pigment. Turpentine could be added to the mixture for a more matt finish. The procedure was not only laborious and time-consuming, it was also extremely injurious to health and many workers died of lead poisoning through handling the corroded metal.

Distemper or whitewash was made in a variety of ways: whitening or slaked lime could be mixed with starch or rock alum which acted as binding media. For stucco distemper, unslaked chalk lime could be boiled in water with ground rice. None of these whitewashes were the brilliant white characteristic of today's chemically produced emulsions, but a soft stone-like off-white, which formed the basis for a range of natural hues such as various shades of stone, pearl, lead, cream, ochre, “wainscot” or “oak” (brown) and “chocolate”. These natural colours were mixed from cheap earth-based pigments and retained their popularity over centuries. The colours were also more resistant to fading than more expensive pigments which would often react badly to the chemical composition of the wall's surface, and they were the only hues available in both oil and distemper. By the 18th century, paint retailers with “colour shops” set up horse-powered grinding facilities on the premises and were thus able to offer paint at extremely competitive prices. In 1718 Marshall Smith patented a machine for grinding pigments for artists' use but it is uncertain what impact this invention had on the decorating industry.

By the end of the 17th century it had become customary to paint all interior wood and exterior ironwork, not least because it was widely assumed that these would rot without the protection that paint afforded. Oil paint was the only waterproof option available and according to John Gay it reeked havoc with fine clothing. “Brush not thy sweeping skirt too near the wall”, he warned in a poem of 1714, “thy heedless sleeve will drink the colour'd oil and spot indelible thy pocket soil”. By this date an increasing selection of colours was becoming available to wealthy householders. At the outset of the 18th century many interiors were rather dark and drab and timber colours such as “walnut”, “oak” and “mahogany” were popular. Fifty years on, however, browns were perceived as cheap and old-fashioned and had been superseded by new, brighter hues including including pea-green, sky-blue and straw-yellow for the main part of the wall. Reds and a drab olive were also considered an excellent foil to gilt mirror and picture frames. Two paintings in William Hogarth's *Marriage à la Mode* (1743) illustrate this trend: in scene two the wealthy newly-married couple occupy a room fashionably decorated with green walls, whereas in the final scene the same couple face bankruptcy and ruin in a shabby interior decorated in

brown. Yellow and blue hues were also considered quite avant-garde during this period and other fashionable colours, including “orange”, “lemon”, “straw”, “pink” and a blossom colour, were mentioned in William Salmon’s *Palladio Londinensis* of the 1730s. Extremely wealthy clients might use “verdigris” (oil paint mixed with oxidised copper pigment to produce a grass green hue), a “fine deep green” or “smalt” colours. “Smalt” was not actually a paint but ground glass that could either be distributed with a feather over wet oil-based paint, or ground exceptionally fine to be used as a pigment. Fashion-conscious householders intent on bright or dark blue walls, but with inadequate resources for a “smalt” finish, used Prussian Blue pigment (ground animal bones and alum) which was invented in Germany in 1704. Prussian Blue was popular in Britain from the 1720s and was used extensively in William Kent’s decorations at Burlington House; along with other colours such as pea green, lemon, straw and “Dutch pink”, it became cheaper and more widely available towards the middle of the century. Until that point, the middle classes had been using the darker but less expensive indigo blue.

Wainscot panelling was either painted to match the overall colour of the walls or grained to imitate expensive woods such as cedar, walnut or mahogany. Marbling was also fashionable at the turn of the 17th and 18th centuries and Celia Fiennes described the “best room” at Newby Park, Yorkshire, in 1697, as entirely decorated in this manner. Other effects included varnishing, gilding and japanning, all of which were staples of the painter-stainer and decorator’s trade. But by 1740, wood graining was no longer in vogue and the tendency was towards panelling painted in two shades of colour to articulate the surface details. Similarly, cornices were treated in white and grey to accentuate the mouldings. Matt finishes replaced the eggshell-like sheens preferred earlier in the century and oil paint was “flatted” with turpentine to remove its gloss.

During the last decades of the 17th century, the late-Baroque European courtly style had favoured large-scale mural and ceiling paintings. Exemplified first in France by the magnificent decorative schemes devised by Charles Le Brun at Versailles, this trend was also evident in England in the work of artists such as Sir James Thornhill or Louis Laguerre. The taste for large expanses of figurative painting and complex stuccowork culminated in the extraordinarily dynamic Rococo style favoured in Austria and Germany in the second quarter of the 18th century which incorporated vast illusionistic ceiling decorations by painters like G.B. Tiepolo. At the same time, however, the Rococo was also a lighter and more informal style and within private houses, particularly in France, it featured extensive use of *boiseries*, often painted in shades of white with the carved details picked out in colour or gold. The reintroduction of classical styles in England under the auspices of Palladianism from the mid 18th century also led to a preference for more restrained effects and colour schemes that enhanced the purity of the architectural proportions and ornamental embellishments of rooms. Broken whites (colours ranging from off-white to dark stone) were considered most elegant, with wood panelling painted in white lead and walls and ceilings a “natural” distemper hue. At Marble Hill House, London, for example, the internal walls were mostly finished in a stone colour and in 1771 William Chambers wrote of a client’s house that he intended “to finish the whole in fine stone

colour as usual excepting the Eating Parlour which I propose to finish pea green with white mouldings”. These *plainer* effects were nevertheless often combined with textiles, and after c.1730 wallpapers, incorporating strongly-coloured, formal damask-style patterns, which were hung in the main part of the wall.

The advent of the full-blown Neo-Classical style ushered in a taste for more complex painted treatments and richer colours including bright blues, greens, lilacs, pinks, black, and, most importantly, terracotta reds, inspired by the example of ancient Roman wall paintings excavated at Herculaneum and Pompeii. These discoveries were especially influential upon the work of the Adam brothers in Britain in the 1760s and 1770s; their interiors incorporated some of the most vibrant colours of the period. Robert Adam’s most vivid schemes were concentrated in the principal reception rooms, and the dominant element was generally the ceilings which were often decorated with white or richly coloured grounds, with elaborate antique details and ornament picked out in hot blues, reds and greens, gold and a deep saffron yellow. Wall colours could be similarly intense and were frequently combined with delicate plaster work, painted white, and pictorial grisaille panels, cameos and medallions devised by artists such as Angelica Kauffman and Antonio Zucchi.

Etruscan interiors were popular in the later 18th century (an example by Adam survives at Osterley Park, Middlesex, and another at Heveningham Hall, Suffolk) and featured deep red-browns and blacks in motifs inspired by classical Greek vases. The pigments used for reds and terra-cottas, which were among the most fashionable colours of the period, were derived from plants such as madder. The pigments used for yellows were derived from much more off-putting combinations: arsenic and sulphur, for example, were combined to create an exceptionally bright shade, while for a deeper, more resonant hue, gallstones were dissolved in water!

In 1807, the phrase “interior decoration” – as distinct from architecture – was coined for the first time in Thomas Hope’s *Household Furniture and Interior Decoration*, and printed manuals and guides for professionals and enthusiasts began to appear. The success of Rudolph Ackermann’s *Repository of Arts* (launched in 1809), which gave wide coverage to many subjects related to furnishing and decoration, attests to the increasing interest in these subjects and started a vogue for interior decoration periodicals that has persisted to the present day. Many publications from this period advised systems of matching colours that co-ordinated with furnishing fabrics, and explained how colour could be used to create the mood appropriate to different rooms. Percier and Fontaine’s *Recueil de décorations intérieures* (2nd edition 1812) and D.R. Hay’s *Laws of Harmonious Colouring* (1828), for example, recommended that libraries should be solemn, dining rooms rich and substantial, drawing rooms vivacious, and stairways cool. Rooms continued to be dominated by a single colour, with red being the most popular for walls: typical hues included crimson, ruby and maroon (in conjunction with yellow), and orange following the Napoleonic Wars. Blues were advised for bedrooms as were greens which were also deemed suitable for libraries and sometimes drawing rooms. Yellows were still considered quite avant-garde: Sir John Soane’s use of “patent yellow” on the walls of his drawing room in Lincoln’s Inn

Fields was regarded as quite controversial, while the Duke of Wellington's yellow rooms at Apsley House, London, were openly criticised. Wallpaper also became more popular as the removal of excise duties in the 1830s and the more widespread adoption of mechanised printing techniques from the 1850s made it a cheaper alternative to patterned hangings or complex hand-painted effects.

From the 1830s marbling and graining once again became fashionable for internal woodwork, panelling and even floors. Walls adopted somewhat lighter and more delicate schemes involving pale blues, lilacs, pinks and "French" greys which were contrasted with darker (plum, green, and flame coloured) panelling. Comfort and informality were also the key notes of Austrian and German Biedermeier styles, with an emphasis on clear bright wall colours and white ceilings, or, alternatively, illusionistically draped and tented effects for a more dramatic effect.

From the mid 19th century, a greater interest in historical styles throughout Europe led to an increasingly eclectic approach to interior decoration and design. Writing in 1840, the London decorators H. W. and A. Arrowsmith declared "the present age is distinguished from all others in having no style which can properly be called its own" and decorations in the "Greek, Roman, Arabesque, Pompeian, Gothic, Cinque Cento, François Premier, Elizabethan, and the more modern French" styles flourished in rapid succession. Owen Jones's *Grammar of Ornament* (1856) and Gottfried Semper's "Über Polychromie" were among the more influential of many contemporary publications that served as pattern books of historic ornament. The stronger colours associated with Semper's theories (inspired by ancient Greek mural decoration) manifested themselves in dramatic patterned polychromatic paint effects on ceilings and walls. Patterns were customarily stencilled, although intricate detailing was applied freehand.

Wallpapers were widely used in middle-income interiors by the third quarter of the 19th century but it was still customary for skirtings, window frames and doors to be grained or painted in drab greens and browns and for plasterwork details to be picked out in colours that matched the dominant hues of the upholstery or walls. Moreover, wealthy clients could still afford the services of specialist decorators and even sometimes artists who produced a variety of complex effects ranging from gilding and stencilling to painted designs and scenes for dadoes, friezes and ceilings. Firms such as Crace & Son specialised in particularly elaborate decorative schemes in the Gothic, Italian Renaissance and French 18th century revival styles, while artisan painter-decorators and provincial firms were kept abreast of contemporary fashions by periodicals such as *The Journal of Decorative Art* (commenced 1881) which regularly published suggestions for wall decoration and treatments for mouldings and woodwork.

The emergence of the Aesthetic Movement in the 1860s and 1870s, with its emphasis on "art and beauty in the home", encouraged the involvement of artists and architects, such as Frederic Leighton, George Aitchison, and Walter Crane in mural decoration and painted schemes. It also fostered a taste for more subtle, tertiary hues – especially blue-greens, greys, and yellowish-greens – that replaced the more lurid tones favoured in the mid-century. The architect E. W. Godwin and the painter J. M. Whistler, both of whom were strongly influ-

enced by the more delicate shades and colour combinations characteristic of Japanese art, pioneered this trend and advocated pale, plain painted walls and matching woodwork. Godwin's decoration of Oscar Wilde's Tite Street home was especially radical; eschewing wallpapers he decorated throughout with paints that he had mixed himself in soft shades of pinks, greys, blues, white and yellow.

Other innovations of the late 19th century were associated with the Arts and Crafts Movement. Many William Morris interiors used densely patterned wallpapers and woodwork stained or painted a dull green, but Philip Webb advocated large expanses of white for the decoration of Clouds, Wiltshire, and Standen in Sussex during the late 1880s and 1890s and this simple, practical approach to decoration was increasingly favoured by the next generation of architect-designers. The functionalist aesthetic of Modernist design saw this approach taken to new extremes with an emphasis on clean lines, light colours and plain, unornamented walls. But the popularity of rich colours, strong patterns and textured effects persisted with the vast majority of householders throughout the late 19th and early 20th centuries, and it was not until the 1930s that simpler treatments became generally fashionable. By this time, new synthetic paints developed by the petrochemicals industry had replaced the water soluble distemper and vegetable oil-based mixtures and were much cheaper and easier to use.

The popularity of plain, painted interiors gathered pace in the post-war period, not simply in line with modern styles but also because of the growing influence of DIY. It reached its peak in the 1960s and 1970s when the influence of youthful, Pop styles encouraged the use of bright primary colours for woodwork and walls. More recently, the interest in historic revivals and country lifestyles has encouraged a broader range of treatments and the use of more subtle period hues. The role of many specialist interior decorators is to realise their clients' aspirations by providing anything from Gothic fantasies to *trompe-l'oeil* Neo-Classical colonnades. Any style can be recreated and the more fashionable painted effects of the 1980s included sponging, rag-rolling, stencilling, marbling and "distressed" treatments. Many of the high-performance modern paints developed by companies such as ICI, however, are not suitable for historic effects, and research undertaken by specialist manufacturers and organisations such as the National Trust has given rise to a range of "traditional" finishes and colours that are more appropriate to the period home. Amid the pluralism of contemporary tastes and styles there are few rules, and while the myriad choices on offer can bewilder the amateur decorator, it is easy to paint over one's mistakes.

Palagi, Pelagio 1775–1860

Italian architect, painter, sculptor and designer of interiors and furniture

Pelagio Filippo Palagi was one of the foremost exponents of Italian Neo-Classicism, and his work embodied the principle of the importance of the full integration of the decorative and the architectural arts. His works were also highly influential for other Neo-Classical designers such as Giocondo Albertolli.

After training under Andrea Appiani at the Accademia Clementina in Bologna (1798–99), Palagi produced designs for vases for the ceramic factory established by Count Aldrovandi in Bologna. He also collaborated with Antonio Basoli on decorative paintings, designed funerary monuments and a celebratory monument to Napoleon (1800). During these early years Palagi was heavily influenced by Piranesi's work, particularly in his use of bucrania, lions, winged figures, and the Egyptian and Etruscan friezes which replaced the scrolls and curves of the Rococo style. Though published before Palagi's birth, Piranesi's *Diverse maniere d'adornare i Cammini* (1769) was an important source for his furniture designs.

Palagi moved to Rome in 1806, remaining there until 1815. He developed an interest in archaeology, copying low-reliefs, sarcophagi, tripods, wall and vase paintings at the Palazzo Corsini, the Palazzo Giustiniani and in the Capitoline museums. These studies were an important inspiration for his furniture, into which he incorporated *klismos* chairs with sphinx supports and tables on monopodia. The massive forms of his furniture were also inspired by the Empire style which had been brought to Italy by Napoleon's courtiers. Like many other Italian designers, Palagi would have been familiar with the original French version of Percier and Fontaine's *Recueil de décorations intérieures* (1801, 1812), before its translation into

Italian by Giuseppe Borsato in 1844. From this book he gained a classical vision of space, in which ceilings, walls and floors are elegantly and harmoniously divided by arches, columns and friezes.

In Rome, Palagi worked on his most renowned early commissions. These included the fresco cycle depicting the *Exploits of Theseus* at the Palazzo Torlonia, and, together with Felice Giani, the decorations at the Quirinal Palace for Napoleon (1812). Stendhal's account of the wedding preparations for Marchese Crescenzi attest to Palagi's contemporary fame: "magnificent tones of colour, very well judged and calculated for the pleasure of the eye by the celebrated Pallagi, painter from Bologna" (*Charterhouse of Parma*, 1839).

The commissions Palagi undertook in Turin between 1834 and 1858 represent his mature work. He designed the entire schemes of interior decoration for the royal palaces, combining Neo-Classical and neo-Gothic elements. These illustrate an originality and sense of fantasy, combined with a scholarly and rigorous approach to redecoration which always took into account existing decorative schemes.

His archaeological interests are illustrated in his Etruscan Cabinet – the private study of King Carlo Alberto of Sardinia – at the royal summer palace of Racconigi near Turin (1834–36). The choice of Etruscan decoration had ideological and political implications: for many years the Etruscan style had been a popular choice for the interiors of aristocratic European palaces. However, Palagi employed it precisely because it was the style "of an antique Italian population". These subtle nationalistic overtones would have been suggested to Palagi through his familiarity with the *Della magnificenza ed architettura de' Romani* (1761) by Piranesi, who, in his effort to counteract widespread pan-Hellenistic tastes, had championed the supremacy and superiority of Etruscan over Greek culture, thereby also anticipating the nationalistic tendencies of the Romantic movement. The study is exceptional in the history of Italian design for its harmonious unity of design and quality of execution. It contains a set of furniture made by Gabriele Capello, called il Moncalvo, Palagi's foremost cabinet-maker, which was exhibited at the Great Exhibition in 1851, where it attracted much favourable attention and won a medal. The set includes a mahogany armchair veneered with ebony, supported on finely carved goats' legs. Its back and seat-rail are decorated with stylised palmette motifs and curvilinear relief stringing, and the seat is covered by a thick cushion, upholstered in pale pink with long fringes. The mahogany table is inlaid with ebony, cedar, walnut, pearwood and holly, and its rectilinear design is subtly curved at the juncture of the legs and feet, which are decorated with animals' heads ending in scrolls. The top is decorated with brick-red, ochre and black inlaid designs inspired by Greek vase painting.

In his redecoration of the Royal Palace in Turin Palagi drew on his vast knowledge of the classical repertory. For instance, in the Council Hall his designs evoke a sense of antique splendour, while also merging successfully with the sumptuous 17th-century decorations by Miel and the woodcarvers Botto and Borello. The balanced decor of the mantelpieces, mirrors, candelabra, chairs and tabourets display a 19th-century response to a Baroque interior in which Palagi was attempting to create the magnificence and ostentation appropriate to the

role of enlightened 18th-century monarch which King Carlo Alberto strove to fulfill. The suite of furniture made by Gabriele Capello is one of the last examples of the Italian taste for sculpted furniture (Bernardi, 1959), and in their grandeur and solidity the pieces recall 17th- and 18th-century Italian models. Their surfaces are thickly gilded and the armrests are decorated with robustly carved half-human, half-mythological figures. The gilding was originally intended to complement the light blue upholstery and wall silks, as Palagi's drawings demonstrate, but these have been substituted by green velvet. Palagi's only surviving original works here are the trimmings on the borders of the seat-rails, and these echo the dado design.

While Palagi chose the Etruscan style for the Etruscan Cabinet and the Empire style for the Council Hall at the Royal Palace, for his next commission, the Margherita Pavilion in the Racconigi Palace park, he chose the English romantic Gothic style. The same style was adopted for the queen's bedroom, which was decorated with a suite of Gothic furniture carved by Capello, and which consisted of mahogany stools, a table and two occasional tables. These are now housed in the *dei principini* (the little princes') apartment in the nearby Racconigi Palace. The room's octagonal shape is reflected in the table's support, which is constructed from eight colonnettes separating niches. The design is repeated in the smaller occasional tables, which are each supported on small carved three-dimensional turtles. Although the basic structure of this furniture was not radical, and the decoration only superimposed onto it, the carved elements define it as Gothic, and it represents an important example of the Italian Troubadour style.

The most important documents for Palagi's career are the drawings now at the Biblioteca dell'Archiginnasio in Bologna, which bear witness to Hayez's characterisation of Palagi as "excellent in the handling of perspective, faultless in composition and outstanding as a draughtsman" (Bandera, 1973). Palagi eliminated the distinction between artist and craftsman, and in his work he also took advantage of the increasingly available resources of industrial technology. Above all, he broke with a prevailing Neo-Classical dogmatism by adopting an eclectic approach which brought Italian design closer to the main European currents in design.

MARIELLA PALAZZOLO

Biography

Born in Bologna, 15 May 1775, the son of Francesco and Giuliana Rattanini. Trained with Andrea Appiani at the Accademia Clementina, Bologna, 1798–99. Provided vase designs for his patron Count Carlo Aldrovandi's ceramic factory, 1798. Painted in Bolognese palaces and cemeteries until 1806. Collaborated with Antonio Basoli (1774–1843) on decorative painting, funerary monuments, and monument to Napoleon, 1800. Elected to Bologna Academy, 1803. Moved to Rome, 1806. Collaborated with Felice Giani at the Quirinal Palace, 1812, and worked on other Roman decorations, 1813. Also worked with Carlo Vanvitelli in Naples. Appointed inspector of the Accademia Italiana, and member of the Accademia di S. Luca, Rome, 1813. Moved to Milan, 1818, where he opened a private school and workshop, and worked at the Royal Palace. Moved to Turin, 1832. Appointed director of decoration of Racconigi Palace, and director of ornament at Accademia Albertina, Turin, 1834, and in charge of decoration of royal palaces in Turin. Knighted. During following years elected member of several other academies. Exhibited at the Great Exhibition in London, 1851. Died

in Turin, 16 March 1860; left his collection of coins, antique sculpture and ceramics to Bologna.

Selected Works

The most important collections of Palagi's drawings are in the Biblioteca dell'Archiginnasio, Bologna, and in the Biblioteca Reale, Turin.

- 1800 Monument to Napoleon (with Antonio Basoli)
- 1812 Quirinal Palace, Rome (interior decorations, with Felice Giani): Napoleon Bonaparte
- 1813 Palazzo Torlonia, Rome (fresco cycle of *Exploits of Theseus*): Count d'Arache
- 1830 Palazzo Arese (building and interiors)
- 1834 Racconigi Palace, near Turin (Etruscan Cabinet and Margherita Pavilion): King Carlo Alberto of Sardinia
- 1834 Villa Traversi, Desio (Gothic Revival tower)
- 1835–40 Pollenzo (building and interiors)
- 1835–42 Royal Palace, Turin (Council Hall, Throne Room, Ballroom): King Carlo Alberto of Sardinia
- 1838 Royal Theatre, Turin (restoration and decoration)

Papier-Mâché

Papier-mâché is a composite material made up of pulped paper, chalk, size, and sometimes sand. It can be shaped by impressing the damp mixture within moulds, and after baking the mixture hardens enabling it to be painted or japanned.

There were two distinct branches of papier-mâché manufacture which developed almost simultaneously in about 1740. The first includes architectural ornaments that were made for use within interiors. In 1672, the scientist Robert Boyle recommended papier-mâché for picture frames and imitation plaster work, but it was not until about 1740 that moulded, pulped paper was developed commercially for making ceiling ornaments, cornices, chimneypieces, mirror-frames, girandoles, etc. When painted white, or gilded, they were indistinguishable from plaster and wooden ornaments. They were also lighter, less expensive and, as Lady Luxborough was assured when decorating her *ferme ornée*, “more durable ... and for ceilings infinitely preferable, especially as they may be moved, being only fastened up with tacks.” Complex schemes were installed by the supplier which increased their cost, but standard mouldings could be fitted by local workmen.

Mrs. Delaney gave the first record of ornaments supplied by a specific maker in 1749, when she “went to Mr Dufour’s, the famous man for paper ornaments like stucco, bespoke a rose for the top of her Grace of Portland’s Dressing Room.” From the 1750s, London makers of paper-hangings, like Masefield, Crompton & Spinnage, James Wheeley, Thomas Bromwich, and Peter Babel, advertised large stocks of papier-mâché ornaments. The saving made by using paper ornaments is shown by two sets of fillets which Thomas Chippendale designed to hide the tacks which secured hangings to battens; a blue and white painted papier-mâché set for Mersham-le-Hatch in Kent, cost only 6d per foot, while a carved and gilded set for the State Bedroom at Harewood House cost 5s 3d per foot.

George Jackson, who had made paper mouldings for Robert Adam since 1765, founded his own company in 1780, which still flourishes today. At the 1851 Exhibition in London, French friezes, pilasters and bas-reliefs were upstaged by Jackson’s “noble chandelier for sixty lights” in *carton pierre* – which, containing more plaster than paper, was poured rather than pressed into moulds. He undertook prestigious commissions including mouldings for the Egyptian Hall at Mansion House, Drapers’ Hall, and the Clothworkers’ Hall.

Also showing at the 1851 exhibition was Charles Bielefeld of Covent Garden, whose mouldings, when decorated in gold, oil paint, size colours or varnish, were thought especially suitable for theatres. Bielefeld made a wide range of goods, from the canopy for the State Bed at Chatsworth, to a full-size village of ten cottages and a ten-roomed villa, all with moulded interior decorations. Now lost, the village was made in 1853 for shipment to Australia. Coarse mouldings, containing more fibre and plaster than paper, continued to be made for suburban dwellings, into the 20th century.

The second branch of papier-mâché manufacture concerns the production of light furnishings and small decorative household objects, all of which were often japanned.

Papier-mâché furniture was covered by a thick, usually black “japan” or asphaltum-based varnish, and variously

painted, gilded and, after 1825, ornamented with mother-of-pearl. A pattern book begun in 1846, shows that 29 colours and imitation malachite and walnut grounds were available; by the early 1850s, the range included many others. Tin, iron, wood and slate, were also “japanned”, often in the same factories, making it difficult, from appearance alone, to distinguish one material from another, particularly when used in combination. It is appropriate therefore, to consider these materials together.

This branch of japanning, as distinct from that which developed c.1660, in imitation of eastern lacquer, was first carried out at Pontypool in South Wales. Although the Pontypool Japan Works concentrated on small tinware, a flower-painted table on a tripod stand (c.1765) and a dressing table (c.1805), both of iron and tin, are known. However, Birmingham and, to a lesser extent, Wolverhampton, were the main centres for japanned furniture, and they provided the lead for similar developments in Germany and America. There were other important centres where papier-mâché and tin were japanned but they focused on smaller decorative objects like trays and boxes.

In 1772, Henry Clay of Birmingham (d.1812), was granted a patent for “making in paper ... panels for rooms, doors and cabins of ships, cabinets, bookcases, screens, chimney pieces, tables, tea-trays and waiters.” This involved laminating sheets of specially-made paper to form a strong “pasteboard”, capable of being used like wood; it guaranteed the success of the Midlands japanning industry. Since Clay’s wares are better documented than those of his contemporaries, they amply illustrate the range of early products.

Early papier-mâché attracted a sophisticated market. Robert Adam admired “Clay’s Ware”, and ordered paper door panels painted by Antonio Zucchi, for Derby House, the London home of the Earls of Derby. Adam thought them “so highly japanned as to resemble glass”, and ordered another set which may still be seen in the Marble Hall at Kedleston Hall in Derbyshire. To judge from a letter sent by Josiah Wedgwood to his partner Thomas Bentley, in 1776, papier-mâché had the same appeal as their jasper ware: “Mr Clay was just gone ... to shew Lady Craven some drawings of Cabinets. The Panels of which are to be of his painted cartoons, perhaps inlaid with Wedgwood & Bentley’s Cameos but however that may be Lady Craven said she would finish hers with their Vases.” It also attracted discerning collectors like Horace Walpole who, in his 1784 inventory of Strawberry Hill, described a writing table by Clay, in the small print room, as “highly varnished; [and] black with blue and white ornaments in a gothic pattern, designed by Paul Sandby.”

In late Georgian and Regency times, large japanned trays, painted with pictures or rich borders, were intended to protect tea-tables; when not in use they were sometimes displayed vertically on side-tables. Later, they often had their edges removed and were mounted in gilt frames to be hung as pictures.

For inventiveness and prestige, Jennens & Bettridge of Birmingham (1816–64), were to Victorian papier-mâché, what Henry Clay had been earlier, although their market was much wider. They, too, had successful rivals like McCullum & Hodson, in Birmingham, and Walton & Co., or Henry Loveridge, in Wolverhampton.

Papier-mâché settee with mother-of-pearl decoration, 19th century

The development of a strong, densely compacted papier-mâché made from pulped paper in 1836, and the introduction of steam-presses to the industry in 1847, quickened production, reduced costs, and, moreover, enabled the plastic qualities of the material to be fully exploited. Chair-backs for example, could be curved in two directions – a technique not then applicable to wood. More typically, and disappointingly, papier-mâché was stamped to imitate existing styles of wooden furniture, such as heavily carved Jacobean chairs.

Notwithstanding the bedroom suite now at Lotherton Hall in Leeds, few rooms were entirely furnished with japanned ware. A more typical order might be that to Jennens & Bettridge in 1839 from a family in Baker Street, London, for “a chess table with Pearl” at 18 guineas, a round table and a pole screen decorated with flowers, and a lake scene, respectively, at 10 guineas each, and a set of finger-plates and door-knobs (for which no price was given). The drawing room furniture bought from Jennens & Bettridge by the Queen of Spain in 1849, confirms a contemporary suggestion that larger furniture was often made for export to Canada, North and South America, Russia, Spain etc.

Papier-mâché furniture shown at the Great Exhibition, included pole-screens, panels for interior decoration, cheval screens, cabinets on stands, tables of all kinds, “drawing room ornament stands”, music stands, chairs, chiffoniers, toilet tables and mirrors. Less typical were the spectacular “exhibition pieces” shown by Jennens & Bettridge, such as an absurd

Day-Dreamer’s Chair. Most firms also exhibited japanned tinware, notably extravagantly shaped and decorated coal boxes for use in the main rooms of the house, and toilet sets comprising jugs, pails, footbaths and sundry accoutrements. Henry Fearncombe exhibited portable washstands in imitation of grained mahogany or Siena marble, while Edward Perry showed ventilators, fire-baskets and screens. Peyton & Harlow, iron bedstead makers, showed an “Iron four-post, with massive pillars of taper iron tubing, head and foot rail, japanned to correspond with a suite of papier-mâché furniture exhibited by Messrs Jennens & Bettridge.”

Japanners were severely criticised for their unprincipled designs, but it was harsh economics that finished their expensive industry. Little furniture was made after about 1870, although smaller decorative articles were made until the 1930s.

Selected Collections

Collections of Papier-Mâché furnishings, ornament and decorative items in Britain are in the City Museum and Art Gallery, Birmingham; the Victoria and Albert Museum, London; Frogmore, Windsor; and the Bantock House Museum, Wolverhampton. Additional collections are in the Städtisches Museum, Braunschweig, Germany, and the Litchfield Historical Society, Connecticut.

Paris 1900

Exposition Universelle

The Exposition Universelle of 1900 was the fifth International Exhibition of its kind to be hosted in Paris and the third under the Third Republic. Like its predecessors, it was intended to be an all-encompassing showcase for the arts and industrial design, and followed the trend toward ever greater opulence and an ever growing scale of presentation. The exposition was the largest yet staged, attracting 47 nations, including major world powers like America, Germany and Britain as well as countries from as far afield as Asia and Africa. Yet, occurring at a time of divisive internal political scandals, some of which, like the Panama Canal project and the Dreyfus affair, became international concerns, the 1900 exposition from its inception was plagued by internal and international dissent and controversy. The initial arrangements for the 1900 show were threatened by a counter-proposal to stage an international fair in Germany and by growing opposition within France. Provincial decentralists sought an end to the cultural and economic dominance of Paris, and nationalists militated for an end to the influx of foreigners and foreign influence on French culture. The hostile climate inevitably resulted in an exposition that was compromised and lacked both coherent direction and conviction of purpose.

As with most of its predecessors, the emphasis was on establishing entertaining and educational spectacles that would provide a showcase for the technological wonders of modern European civilisation. A major attraction was the *trottoir*

roulant, a moving pavement which had featured in the Chicago International show of 1893, though the 1900 version had three lanes moving at variable speeds. It also featured an electronically powered overhead railway and an enormous "Dome of Discovery", a spherical structure which housed under its curved façade a planetarium. Other technological presentations at the exposition included the first displays of automobiles and bicycles at an international fair, wireless telegraphy, sound synchronized with film, and the first demonstrations of X-rays.

Yet, despite these attractions and the rhetoric of progress and vanguardism that characterised the opening ceremony's speeches, the exposition was relatively lacking in the kind of innovation and technological advancement that had characterised the previous two expositions. The 1900 exposition concerned itself instead with retrospective displays in technology and arts and design in order to sum up the achievements of the 19th century. One of the most novel features of the exposition was a street populated by houses, pavilions and palaces intended to reflect the indigenous styles of participating nations. This flamboyant Rue des Nations was located along the Seine and spanned several hundred metres. Twenty-two of the 23 nations that constructed pavilions provided buildings that were designed and decorated in identifiably "native" styles, the exception being America which opted for a classical pavilion resplendent with allegorical decoration.

The Rue des Nations represented the star attraction of the exposition. Of all the displays on offer it was undoubtedly the most significant, symbolising the dominant and distinctive trend within the exposition toward historicism and nationalist ideology. Though historical styles, particularly classicism in architecture and design had prevailed in the previous expositions, the increasing trend had been toward the profiling of progressive technologies. The 1889 exposition, falling in the centenary year of the French Revolution, had been used to celebrate radical republican initiatives. The Third Republic used the exposition as a showcase for the idea of progress, an aim expressed through a new enterprising and utilitarian aesthetic that fostered the unity and synthesis of the sphere of arts and design with engineering principles and industrial materials. This aesthetic was embodied in the dynamic Modernism of the Eiffel Tower and the Galerie des Machines. The exposition of 1900, in stark contrast, was concerned with consolidation and *rapprochement*, embracing a more populist, reconciliatory and conservative profile that reflected the widespread trend within Europe toward national self-consciousness and re-definition.

This was evident in the buildings erected for the exhibition. Two new buildings, the Petit and Grand Palais, were constructed on the right bank to supplement the array of existing venues used to house the exhibits. The design of the Petit and Grand Palais signalled the ascendancy of a new pluralist and historicist accent in the French presentation of the exposition. The eclecticism of these two buildings incongruously mixed engineering technology with traditional motifs, blending disparate materials and styles. The prefabricated Palais de l'Industrie, a building which had played a prominent role in previous expositions and which was notable for its functionalism and engineered design, was demolished to make way for these more compromising architectural solutions. This indicated a relative shift away from the pre-eminence of engineer-

ing which had held sway at the expositions between 1851 and 1889 toward a more craft-based approach to the arts and design. This trend reflected the widespread lack of confidence in Europe in notions of progress and in the prospect of long-term economic prosperity.

Yet, ironically, if the exposition was essentially characterised by trenchant Nationalism and a corresponding return to Historicism, the dominant aesthetic being emphatically “revivalist”, it can also be remembered as the forum which witnessed the forceful emergence of Art Nouveau onto the international stage. Indeed, Hector Guimard’s enduring designs for the Métro station entrances were unveiled to coincide with the opening of the exposition.

The 1900 show saw the largest gathering of Art Nouveau artists ever assembled, attracting practitioners from throughout Europe. French exhibitors included Eugène Gaillard, René Lalique, Emile Gallé, Guimard, Carriès, Louis Majorelle, Georges de Feure, Raoul Lachenal and Alexandre Charpentier. The non-French Art Nouveau exhibitors included Alfonse Mucha, Richard Riemerschmid, Hermann Obrist, and Joseph Maria Olbrich. The only notable absences were Belgian architect-designer Victor Horta, who was widely credited with founding Art Nouveau, and Charles Rennie Mackintosh, whom many regarded as the leading exponent of the designers who came to be known as the Glasgow School.

Art Nouveau design embodied many disparate currencies of reform in the arts and design, a fact reflected in the distinctive names it acquired in different countries. Yet, in spite of different national inflections, certain common tendencies bound the artists’ works together at the exposition. In contradistinction to the prevailing neo-Baroque and neo-Rococo styles, Art Nouveau was decidedly internationalist and anti-historicist. In place of cultural references, Art Nouveau substituted organic sinew-like forms which drew their inspiration from nature. Indeed, Art Nouveau practitioners saw historicism as no longer appropriate to an industrialised world and instead sought timeless and universal forms appropriate to a new global economy. It exhibited a tension between a commitment to craft-based modes of production with a responsiveness to the conditions and needs of modern urban life. Art Nouveau embodied the Wagnerian notion of *gesamtkunstwerk* (total work of art). Its practitioners therefore sought to construct complete environments which expressed a unified design aesthetic throughout. Hence buildings, furniture, graphic illustrations, wallpaper, art works, carpets and fittings were all conceived to correspond to a dominant characteristic, synthesising material and form.

The idea of the *gesamtkunstwerk* was in evidence at the exposition in the fully fitted interiors of Olbrich and Hoffmann. Similarly, Guimard displayed sample interiors and *objets* from his Castel Béranger, a new Parisian apartment house he had completely designed from façade to fittings. Art Nouveau exhibits also appeared both within the Decorative Arts Palace inside the National pavilions and in separate individual buildings assembled by private groups or individuals. Among the French exhibits of Art Nouveau there was glass, metal, ceramic and furniture designed by Gaillard, Guimard, Gallé, Charpentier, Majorelle, Lalique, de Feure, Lachenal and Carriès which was displayed both in the Pavilion de la Union

Centrale des Arts Décoratif, and in the buildings constructed by stores such as Le Printemps, Le Bon Marché and Le Louvre.

In addition to these venues there was the Art Nouveau-designed Pavillon Bleu, a restaurant adjacent to the Pont d’Iéna, and the flamboyant Pavilion of Siegfried Bing, the wealthy impresario of Art Nouveau. The latter took the form of a fully-furnished seven-room house on the Esplanade des Invalides, featuring works by Gaillard, de Feure and the lesser known Edward Colonna. Yet, arguably the most radical currents within Art Nouveau were occurring outside of France, and this was reflected in the exhibition. The American Louis Comfort Tiffany showed lushly coloured stained glass and *Favrile* glass vases and Henry van de Velde, one of Bing’s most favoured artists, presented designs for two German pavilions. Bernhard Pankok’s innovative design of the German catalogue to the exposition, with its graceful floral and abstract patterns and Jugendstil font, represented a landmark in the history of book design.

Critical opinion turned on whether Art Nouveau with its eschewing of the past represented “l’Esprit Nouveau” and a legitimate new direction or merely a modish and short-lived mania in the evolution of modern design. French critics at the exposition, suspicious of the composite nature of Art Nouveau’s origins, criticised its eclectic foreign influences, its unorthodox anti-classical proportions, asymmetry and stark contrasts of simplicity and complexity, lightness and darkness and openness and gravity. Of the Art Nouveau designers only Gallé’s glass and marquetry works and Lalique’s miniatures and jewelry consistently received praise. It was only at the succeeding International Fairs that Art Nouveau was to achieve critical recognition.

The 1900 exposition had been conceived with a view to reasserting cultural consensus and harmony within Europe, yet it provoked widespread disillusionment and exposed deep and ever-widening cultural divisions within and between the participating nations. French industrial technology and even its cultural pre-eminence had been undermined by the mechanical ingenuity of the Americans, the elegant taste of the Japanese and above all the hordes of innovations and inventions from Germany. Within France the exposition was widely regarded as a failure and it was to be many years before France was to consider staging another comparable exposition.

Paris 1925

Exposition Internationale des Arts Décoratifs et Industriels Modernes

The idea for this exhibition was first mooted as early as 1906, as a French riposte to the *Exposizione Internazionale* held in Milan in the same year. Proposed again in 1911 by the *Société des Artistes Décorateurs* it was voted for by the *Chambre des Députés* in 1912. Having been planned for 1915 as a display of modern decorative arts which forged links between artists, craftsmen and industry, the outbreak of World War I inevitably led to its postponement.

The notion was resurrected in 1919 as part of the French post-war programme of industrial development and economic recovery, attracting positive support in business and manufacturing circles. France's invitation to all of her wartime allies to participate in the exhibition, alongside her exclusion of Germany, also embraced an underlying political agenda which sought to make it clear that military defeat also had consequences in the cultural arena. Sponsored by the Ministries of Commerce and Fine Arts, the exhibition was conceived with the specific purpose of restoring France to a position of international leadership in the decorative arts, a position which before the war had become increasingly fragile in economic terms due to the growing international industrial competitiveness of other countries.

The exhibition was also intended to encourage the establishment of a modern design vocabulary which blended traditional French expertise in the design of luxury goods with the realities of modern mass-production technology. However, unashamed luxuriousness and elitism characterised a significant proportion of the exhibits, and the show was criticised in some quarters for the opulence of many of the exhibits which were way beyond the means of the everyday consumer. Subsequently the 1925 exhibition has been seen by historians as something of an ideological battleground between the decorative tendencies of the *ensembliers* and the austere functionalism of the Modernists, with the upper hand firmly, at least in a material sense, going to the former through sheer numbers of exhibits. Uncompromisingly Modernist output was largely restricted to Le Corbusier's controversial *Pavillon de L'Art Nouveau* and Konstantin Melnikov's *Soviet Pavilion*; as has been indicated, Germany, where many facets of Modernism could be seen in progressive centres such as Frankfurt and

Paris 1925: Pavillon for La Maîtrise by Maurice Dufrène, Galeries Lafayette

Stuttgart, had not been invited to participate in the exhibition and the Dutch national committee ignored the claims of avant-garde designers associated with the *De Stijl* group, preferring the more decorative aesthetic associated with the Amsterdam School. The United States declined an invitation to participate, limiting the number of exhibiting countries to 22, with an emphatically European focus.

The national propagandist outlook of the French, which had underpinned the rationale for the exhibition, assumed physical form in the large proportion of the space devoted to the French sections, about two-thirds of the whole site. A number of the most lavish French displays could be seen in the exhibit of the *Société des Artistes Décorateurs* entitled "Reception Rooms and Private Apartments of a French Embassy". Occupying a prime site on the *Esplanade des Invalides* and consisting of 25 rooms set round a three-sided courtyard, it was seen by some as the epitome of luxury and wealth and by others as quite out of tune with the realities of modern life. But in fact it could be seen to exhibit two strands of Art Deco, one which paid deference to tradition and past styles (as exemplified by André Groult in his bedroom of the Ambassador's wife) blended with a contemporary flavour, the other more emphatically modernising, as seen in the work of Robert Mallet-Stevens, Pierre Chareau or Francis Jourdain.

Such distinctions between “contemporaries” and “moderns” were acknowledged in an introduction to the exhibition published in *Art et Décoration* in May 1925. The rooms at the French Embassy were fully furnished throughout and among the most celebrated interiors was the Smoking Room by Jean Dunand, with its Cubist-inspired forms and decorative motifs, a stepped silver ceiling set off against highlights of red lacquer, and wall facings of black lacquer.

Another lavish pavilion which attracted particular criticism, as well as the admiration of many others, on account of its elegance and refinement was Jacques-Emile Ruhlmann's Pavilion of a Wealthy Collector. The very title reflected Ruhlmann's association with fashionability, exclusivity and expense, for his ideas were more closely rooted with craftsmanship than industry. In his Pavilion he brought together a range of leading artists and *ensembliers* who linked past styles and traditions with the tendencies of the present day. Lacquered furniture by Dunand, decorative iron railings by Edgar Brandt, blue and pink carpet by Gaudissard and the celebrated exoticism of Jean Dupas's oil painting *The Parakeets* all contributed to the overall aesthetic effect. Louis Süe et André Mare's Musée de l'Art Contemporain attracted a similar aura of richness and bright colour, especially in the drawing room where highly decorative wallpaper, carpet and furnishing fabrics wedded past traditions to contemporary decorative ideas. In fact, the drawing room was used as a stage set for a play put on at the Comédie-Française in the same year, Paul Géraudy's *Robert et Marianne*.

As at the Paris 1900 international exhibition, some of the most impressive exhibits could be found in the pavilions of the great Parisian department stores which were allocated prominent sites in the French section in 1925. The luxurious displays of the stores stemmed from their desire to capitalise on the growing public interest in contemporary design, a commercial orientation which had earlier led to the establishment of their own design ateliers: Primavera (under the directorship of René Guilleré) had been established at Printemps in 1912, La Maîtrise (under Maurice Dufrene) at Galeries Lafayette in 1921, Pomone (under Paul Follot) at Bon Marché in 1923, and Studium Louvre (under Etienne Kohlmann and Maurice Matet) at the Magasins du Louvre in 1924. At the Exhibition the stores displayed a series of designs for furnished interiors for a variety of specific uses: living rooms, dining rooms, bedrooms, boudoirs and smoking rooms could all be easily compared with the ensembles provided by their competitors.

Other notable French designers prominent at the 1925 exhibition included René Lalique who designed a dining room in Sèvres Porcelain, with walls of inlaid glass mosaic; a fountain outside the French Embassy; as well as a great deal of the glassware seen throughout the French sections. The Lalique Pavilion itself contained essays in the exploration of the possibilities of glass.

It is clearly impossible to enumerate the contributions of all of the national displays in the exhibition. One of the main areas of contention among critics, and even exhibitors, was that the exhibition regulations had stipulated that only “articles of modern aspiration and real originality should be shown”. The British had sought to endow them with a particular interpretation by suggesting in a submission to the French authorities that “these words do not mean that exhibits will

only be admissible if they are entirely novel in design. Originality, it is clear, may be displayed as much in the development of existing art-forms as in the invention of the entirely new. The term (originality) should, therefore, be interpreted in a liberal sense, as indicated above, but mere copies and reproductions must be rigorously excluded”. Confusion about interpretation of the regulations was not as much a cause of the poor showing of British art industries at the 1925 exhibition as the British government's severe constraints on public expenditure. (Many British manufacturers had also invested in the 1924 Wembley Empire Exhibition, which in its first season, attracted nearly three times as many visitors as Paris in 1925). Just as the French *artistes-décorateurs* had acknowledged past styles and traditions in their contemporary Deco productions, so other countries could look to their artistic roots in peasant and folk art tradition.

For example, this was true of the Polish displays which were underwritten by the Polish government, eager to promote a positive national identity on the international stage. The Polish Pavilion, designed by Josef Czajkowski, contained colourful murals (which drew upon peasant festivals and Slavic myths for their subject matter), tapestries, furniture and fittings which were every bit as coherent as the ensembles of the French *artistes-décorateurs*. Reflecting the origins of many of the main exhibitors in the Polish Arts and Crafts movement, the display wedded the vernacular with the contemporary and attracted the favourable attention of the Exposition juries. Much of the work was produced by members of the Cracow School and Warsaw Academy of Fine Arts.

The Pavillon de l'Esprit Nouveau by Le Corbusier and the USSR Pavilion by Konstantin Melnikov were unequivocally modern in their outlook and perhaps most literally endorsed the supposed preconditions of “modern inspiration” and “real originality” contained within the exhibition regulations. The former, in particular, aroused hostility from most of those associated with the promotion of handicrafts, individuality and nationalism. Indeed, the exhibition authorities placed a high fence around it which was only removed shortly before the exhibition's opening, at the insistence of the French Minister of Fine Arts. Uncompromisingly geared to modern mass-production technology, its smooth, plain surfaces, spatial clarity, uncluttered internal ambience and simple, standardised furniture and fittings were in tune with the original guidelines of the exhibition. Le Corbusier's austere aesthetic undermined the exhibition's perceived need for decorative art, an ideological position strongly reinforced by his 1925 book, *L'Art Décoratif d'aujourd'hui*. There he declared that “trash is always abundantly decorated; the luxury object is well-made, neat and clean, pure and healthy, and its bareness reveals the quality of its manufacture. It is to industry that we owe the reversal in this state of affairs: a cast-iron stove overflowing with decoration costs less than a plain one; amidst the surging leaf patterns flaws in the casting cannot be seen”. That the Pavillon de l'Esprit Nouveau was, like its highly decorated counterparts elsewhere at the Exhibition, also directed towards a well-to-do clientele was evidenced by the inclusion of a maid's accommodation. The USSR Pavilion, erected at a late stage, expressed a similarly austere aesthetic, which was followed through in the rather spartan interior of the Workers'

Club by Alexander Rodchenko, with its simple, utilitarian furniture and fittings.

The 1925 exhibition did much to popularise the Art Deco style and to awaken interest (as the official British Report noted) in precious materials such as “ivory, crystal, glass, lapis lazuli, malachite, ebony and tropical woods”, and the rich possibilities afforded interior designers by a variety of natural and artificial lighting techniques, utilising free-standing elements as well as built-in architectural components and glazed bricks. Many of the more lavish ensembles can be seen to have exerted an influence on Hollywood film sets, which in turn did much to popularise the style. Cedric Gibbons, the leading Hollywood art director of the time, visited the 1925 exhibition, and its direct influence could be seen in the fountain scene from *Our Blushing Brides* of 1930. Although the United States did not participate in the 1925 Exposition, it did appoint a commission under Charles Richards, Director of the American Association of Museums, to visit it and report on the state of contemporary European design. As a result, Richards organised a tour of designs from the 1925 exhibition to nine museums in the USA, commencing with the Metropolitan Museum in New York. The Deco style soon became fashionable and was actively promoted by leading stores throughout the country, many of which also mounted exhibitions. It was closely linked to architecture in the second half of the 1920s and was commonly to be found in external detailing, particularly on the lower storeys, and in the public interiors of New York skyscrapers, such as William Van Alen’s Chrysler Building of 1930.

Paris 1937

Exposition Internationale des Arts et des Techniques Appliqués à la Vie Moderne

Despite taking place in the wake of six years of economic crisis, the 1937 exhibition was larger than all previous Parisian exhibitions, on a site of 250 acres. Inspired in part by the much smaller 1925 Exposition des Arts Décoratifs et Industriels, the 1937 show was centred on the debate concerning the role of ornamentation in modern everyday life. The two sides in this debate in France were represented, on the one hand, by the Modernist and politically radical faction, epitomised by the Union des Artistes Modernes (UAM), which sought “balance, logic and purity” in its pavilion and, on the other, by the more conservative Société des Artistes Décorateurs, from whom the founding members of the UAM had seceded in 1930. In its pavilion designed by Pierre Patout, the Société continued to propagandise for a central place for the decorative arts, as it had at the 1925 Exposition. However, the 1937 exhibition has been most widely remembered as a venue for the unambivalent expression of political power in the architecture and interiors of a number of other pavilions that embraced specific national ideologies. The most notable of these were the dominant pavilions of the USSR and Germany, designed respectively by Boris Iofan and Albert Speer, which faced each other across the Champ-de-Mars.

185 artists participated in the decoration of the Société des Artistes Décorateurs’ three-storey pavilion, which was located at the heart of the exhibition in the Centre des Métiers (Crafts). Indicating the cultural tenor of its exhibits, Anatole de Monzie, President of the Société, wrote in the catalogue that the “right to individualism in art is being reborn everywhere and with it a new taste for beautiful objects – the sign of spiritual freedom”. This was often taken to extravagant extremes, and the sumptuous and dramatic designs by André Arbus for a Residence in the Île-de-France, the almost Baroque detailing by Louis Süe in his designs for an Embassy and Maurice Dufrène, in his gilded and draped Woman’s Bedroom for La Maîtrise, attracted particular criticism. Nonetheless, there were other interiors by Société designers which were tempered by concessions to the greater austerity of the Modern Movement, as well as experimentation with a variety of woods, metals, ceramics and glass. Much more diametrically opposed to the Société’s elitist tendencies was Le Corbusier’s Pavillon des Nouveaux

Temps for the Congrès Internationaux d'Architecture Moderne (CIAM) which was relegated to a remote corner of the grounds on account of its rejection of decoration and ornament.

Even if many of the exhibits did not embrace designs which were unreservedly committed to a modern democratic lifestyle, in many other respects the 1937 exhibition acknowledged the modern spirit. New materials and media had their own pavilions devoted to themes such as cinema, radio, photography, and transportation. Furthermore, a number of national pavilions, including those of Denmark, Finland, the Netherlands, Sweden and Poland, accorded with the exhibition's avowed commitment to "modern life" in their endorsement of the International Style. The humanising Modernism typified by the output of the art industries of the Scandinavian countries which had increasingly come to the fore after World War I continued to attract favourable critical attention; perhaps most notable in this respect, with its emphasis on woods and natural materials, was the Finnish Pavilion by Alvar Aalto. The Netherlands Pavilion stressed its commitment to design in modern life through its exhibition of a large hall decorated with the furniture and fittings of one of the new liners of the Holland-America line. Other countries sought to embrace a wide social spectrum in their displays. For example, in the Belgian Pavilion designed by Henry van de Velde, the lifestyle of different social classes was shown in a series of halls that included designs from a range of manufacturers, all selected by van de Velde himself. The products displayed all stressed craftsmanship in "modern life" and room settings chosen ranged from the output of design studios such as that of Marcel Baugniet to that of the larger stores, such as the Bon Marché in Brussels.

Other national pavilions shared something of the French conflict of design ideologies to which reference has already been made. For example, the "moderne" flavour of the architecture of the British Pavilion by Oliver Hill was subject to considerable criticism, an attitude which extended to many of the exhibits on display within. Many others were also seen to represent a regressive view of Britain with an emphasis on sport, tradition and cultural heritage, retrospective qualities which, in a different and more artistically-charged way, could be detected in the pavilion of the Société des Artistes Décorateurs. In their own ways neither pavilion was attuned to the economic realities of modern life, endorsing handicraft rather than mass-production as an embodiment of "modern life". In terms of interior design, the centrepiece of the British display was the Weekend House with living / dining room by Gordon Russell Ltd., dining room by Heal & Son and kitchen by Dorothy Braddell. The overall aesthetic represented a distinct compromise between the progressive Modernism of the avant-garde and the more historicising eclecticism of much British design of the period. The Modernist Austrian Pavilion designed by Oswald Haerdel also contained designs which reflected the confusions afforded by the exhibition's title. The internal displays revealed continuing national strength in the arts and crafts and included among the interior exhibits a striking furnished room designed by Josef Hoffmann. This had a floor of mirror-glass upon which was placed a white rug, with ceiling and floors fashioned from corrugated silver-coloured paper. Furthermore, extensive use was made of mirrors both in

furniture and in the wall recesses. In such displays "modern life" was inevitably restricted to a social elite.

Popular or folk art was visible in more than 60 of the pavilions in the exhibition, oscillating as many of them did between modernising and national, and thus indigenous, characteristics in the crafts. Some countries sought to suppress peasant handicraft in their displays, seeing them as symptoms of a "backward" past rather than as contemporary bearers of tradition. Nonetheless in the Hungarian, Romanian, Polish and Portuguese and other pavilions could be found vital displays of peasant art. Indeed the Polish displays, set within a Modernist setting, endorsed the vernacular as an important aspect of national culture which complemented the more austere forms of the modern interior, albeit utilising regional materials. French regional and historical styles were also to be found in the 1937 exhibition in the Centre Régional, while the more exotic decorative styles associated with the different cultures of the French Colonies could be seen in the Île de Cygnes which boasted exhibits from French Equatorial Africa, the Cameroons and elsewhere, together with Indochinese craft shops and Moroccan markets.

The 34 million visitors to the exhibition were insufficient to put it into profit. This was in no small part due to the fact that many of the pavilions were not ready until more than a month after the exhibition opened, the Centre Régional even later, and thus had a detrimental impact on the financial position. The many conflicting interpretations of the exhibition's title perhaps reflected the highly volatile economic and political climate of the later 1930s as much the cultural tensions inherent in contemporary artistic production, although in many cases the two were inextricably intertwined.

Parish-Hadley Associates

American interior decorating firm; established 1933

Parish-Hadley Associates, founded by Dorothy "Sister" Parish in 1933 and joined by Albert Hadley in 1962, stands as the most well-known and prestigious American decorating company of the mid- to late 20th century. Interiors by the firm tend to follow two distinct, yet complementary paths: those by Parish are noted for traditional, comfortable rooms in the English country house style, filled with bright colors and patterns, and a mixture of contemporary furnishings and antiques, while those by Hadley combine simplicity with classicism and Modernism.

Parish (1910–94), born Dorothy May Kinnicutt, started her decorating business in Far Hills, New Jersey, to supplement her husband's income after the Wall Street stock market crash in 1929. She had frequently travelled to Europe as a child, as her parents had homes in the United States and France. On a trip to France, when she was a teenager, Parish first saw painted French furniture which led to her appreciation and study of decorative arts and interior design. Parish had no formal training in interior decoration, only establishing her business, Mrs. Henry Parish II Interiors, after friends had sought her advice for the decoration of their houses.

After World War II, Parish moved her firm to Manhattan and it soon grew to become one of the foremost decorating companies in America. She was the first to introduce the "undecorated look" to the United States. Although this comfortable style had been developed in English country houses over the centuries through changes in taste and the acquisition of objects from different periods, the London firm Colefax and Fowler codified the juxtaposition of styles and the use of chintz as the preferred material for upholstery. Parish's additions to the style included an abundance of pillows and slipcovers upholstered in chintz and the introduction of humble materials, such as mattress ticking, for upholstery. Her rooms had pastel-colored walls, painted floors covered with rag rugs or brightly colored floral carpets, knitted throws, patchwork quilts and baskets of cut flowers. Her interiors were innovative in their use of these country or rustic items within formal and elegant rooms.

Furnishings in Parish interiors were arranged for easy, comfortable conversation, mixing the modern and the antique. Parish said, "I have a *horror* of anything matching." She did not believe in any wasted space, and filled corners and tables with diverse objects. The cacophony of styles was intensified by her use of contrasting and conflicting floral patterns and colors within these crowded rooms.

In 1962, Albert Hadley (b. 1920) joined Sister Parish after teaching at the Parsons School, where he had been a student, and working for the important and well-established New York decorating firm, McMillen Inc., between 1957 and 1962. A year later, Hadley was made a partner in Parish's firm and soon the name was changed to Parish-Hadley. Whereas Parish's style was renowned for its casual, comfortable interiors full of color and pattern, Hadley's work centered around the architecture of the room. This manner of working reflected his training at Parsons and at McMillen, where interior architecture formed the most important aspect of the room, creating a setting for

Parish-Hadley: Manhattan living room, including a mixture of traditional furniture and contemporary art

refined and elegant furnishings. According to Hadley, "architectural design is the basis of all good interior work, and without good architectural design, anything that is added or subtracted is sheer decoration."

Like Parish, Hadley also incorporated eclectic furnishings into his interiors, including English, French, and Eastern furniture with modern art and design. His use of simple, plain, luxurious fabrics for upholstery and draperies complements the rich colors of the walls and elegant furniture. He is credited with originating the first red-lacquered walls, in Mrs. Vincent Astor's library in her New York apartment, building up many layers of paint and glazes to produce a deep, lustrous color. Lacquered walls became a trademark of the company's interiors, produced in emerald green and chocolate brown as well as *sang de boeuf* red. Other innovative paint-work and techniques used by the firm included: dark colors sanded and varnished until they were glossy; walls *striéed* in two directions, giving the impression of plaid; walls and ceilings covered with silver tea paper; and stencilled and incised designs on floors. He designed a softer look for the upholstered furniture supplied by Parish-Hadley that he had learned while working with a Nashville decorator, A. Herbert Rogers, before attending Parsons.

Parish-Hadley's clients have included many of the country's social and business elite: the Astor, Rockefeller, Getty, Vanderbilt and Whitney families. Some of Parish's most famous interiors included those for the Kennedy family. During the late 1950s, she designed the interiors for Senator and Mrs. Kennedy's Washington town house and in 1961, Jacqueline Kennedy invited Parish to assist her in the decoration of the Kennedy family's private quarters and state rooms in the White House. Parish was also asked to be a member of a committee to help furnish the White House with 18th-century decorative arts. In several projects, Parish and Hadley worked together,

including interiors for Mr. and Mrs. Samuel Reed and Mr. and Mrs. William Paley, combining their differing styles in complementary ways.

Designers who have worked for Parish-Hadley, before opening their own businesses, include Mark Hampton, Kevin McNamara, Harold Simmons and many other important late 20th century American decorators. More recently, Gary Hager, whose style contrasts significantly with Parish's own, joined the firm. He advocates the use of simple, symmetrical and restrained interiors, with ordered spaces, although he still incorporates some antiques from a wide variety of sources. Parish has had many followers imitating the casual, comfortable, yet costly, combination of antiques in myriad styles upholstered in bright colors and a multitude of patterns.

In 1994 Parish-Hadley entered the furniture business, introducing a new line of furniture designed by David McMahon. These designs, manufactured by Baker Furniture Co. of Grand Rapids, Michigan, adapt several 17th to 19th century antiques from Parish-Hadley's collection.

Parish's cozy, yet dignified style, combined with Hadley's Modernism and attention to architectural space, has led to Parish-Hadley's consistent and enduring success.

Parlours

Up to the 19th century "parlour" was the non-specific name given to a living room. During the 19th century the parlour was a particular type of living room: in upper- and middle-class houses this was a general purpose room of secondary importance, while in working-class homes it signified the best room. The term began to disappear from use in the 20th century, dying out completely after World War II.

The term parlour, from the French *parler*, to talk, came into use when medieval hall houses had smaller rooms created, in the 13th century, to offer greater privacy for the lord and his family. These rooms were divided from the great hall by a screen; this was at the upper end, with the kitchen and pantry at the lower end. At this time the parlour was a room for the family to withdraw to after meals in the great hall; sometimes two parlours were created, one for winter and one for summer use. By the 14th century it was becoming usual for the family to eat privately and then the parlour became a dual purpose

sitting room and dining room. Portable dining furniture was used so that the room could be freed for other uses.

By the 16th century the parlour was a more formal room for conversation. In smaller houses of this period, where one or two rooms had previously sufficed, the need for greater variety was beginning to be felt. The creation of a parlour provided a living room that was divided off from the dirtier work of the kitchen. This also allowed the parlour to be used for display purposes including, to a limited extent initially, the display of textiles. In the 17th century textiles became increasingly important, providing both decoration and comfort. In England, France and Holland in the late 17th century Indian printed calico, or chintz, became very fashionable for parlours as well as bedrooms.

Throughout this period parlours were not private rooms; the lack of passages and corridors in houses meant that rooms led out of one another. Privacy was not expected in homes before the later 18th century, except in boudoirs in the wealthiest homes.

As both the number of, and the differentiation between particular types of rooms increased during the 18th century, the character of parlours gradually began to change. The general purpose parlour, or sometimes dining parlour, continued to exist, but other rooms began to serve more specialised functions and were decorated accordingly in different styles. This move towards greater differentiation in larger homes resulted in a general downgrading of the parlour during the course of the 19th century. Exceptions to this development tended to occur in houses where an antiquarian taste prevailed and particularly when a Gothic interior was desired. A notable example is Horace Walpole's Strawberry Hill, where the Great Parlour (c.1760) was not only the largest room in the house but also occupied a prominent position for formal entertaining.

In middle-class homes in the late 18th and early 19th century having two parlours was seen as a mark of middle-class status; one usually doubled as a dining parlour, though in wealthier homes it was felt desirable to have a third room to be made into a dining room. In the early 19th century it was still common practice to use both parlours regularly. Different decorative schemes might reflect gender differences, the dining parlour taking on a more masculine tone while the sitting parlour followed more feminine tastes. If further evidence of middle-class status was required then one room might be more elaborately furnished and called a drawing room while the parlour remained as a more humble, general purpose sitting room. Due to this downgrading it is difficult to be specific about the decoration and furnishing in these rooms since they would have been as fashionable as the family could afford, but in many cases they were no doubt equipped with older items discarded from the more important drawing room. Only in America, where the term parlour was widely used for much of the late 18th and 19th centuries to designate the principal living or reception room, did it retain its standing as a room worthy of expensive decorations and furnishings.

Working-class homes were obviously much smaller than their middle-class counterparts and did not enjoy the same subtle gradations in the use of rooms. But during the 19th century it became usual to have a parlour as a best room for use on Sundays and special occasions, while everyday living

went on in the kitchen. Thus, while parlours in the better kinds of middle-class homes were increasingly used as a secondary, daytime family sitting room, in lower-middle-class and working-class dwellings, they comprised the most important room in the house and were infrequently used. The image of the late 19th century, lower middle-class best room has given rise to the popular stereotype of the parlour as a claustrophobic and pretentiously furnished shrine to gentility complete with aspidistra on a table in the window, antimacassars on overstuffed chairs and fussy tables covered with framed pictures and souvenirs.

In urban terrace houses the parlour was often the front room with the kitchen behind and the scullery in the back extension. Both of these back rooms, where all the day-to-day family activities took place, had severely restricted access to light, and only a view of the yard, while the parlour was brighter and faced onto the road. This mode of living was strongly criticised as impractical and unhealthy by sanitarians, and reformers mounted a vigorous campaign against parlours during the late 19th century. A notable example of the reform of houses for working-class tenants was Raymond Unwin's designs for New Earswick, built in 1902–03. These houses had only one sitting room with windows on two, and sometimes three sides to give maximum light and ventilation. Also by doing away with the infrequently used parlour it was possible to create a larger sitting room that Unwin claimed made better use of space in small terrace houses. But despite the undeniable logic of this approach, it ignored the potency of the best room as a symbol of working-class respectability and the pride with which its owners kept it clean and tidy.

In Britain, following the Addison Act of 1919, some early examples of local authority housing in the inter-war period included a number of houses with parlours, but subsequent housing mostly dispensed with them. Private housing opted for a sitting room and dining room, an arrangement that became the norm in the post-war period and that has continued up to the present day.

Passementerie

The French term *passementerie* refers to trimmings applied to upholstered furniture and fabric hangings to define lines and add decorative detail. These may be cord, gimp, woven tape or braid, fringe, piping, or tassels. Trimmings were applied to hangings in Renaissance Italy, where they were hand-made by local craftsmen. The Italians introduced the craft to France, where a guild, the Corporation of Passementiers, was established to weave braid and other edgings for furnishings and clothing, particularly livery and military uniforms. The *passementiers*, having obtained the privilege of working in gold and silver thread, developed elaborate looms and techniques for incorporating metal into their braids and tapes. Finishing was done by hand, often by women doing piece work. Upholsterers applied these trimmings to furniture made in their shops, and also sold them separately to be added to curtains and hangings made at home.

Trimmings have always been an expensive addition to upholstery, even in modern times when much of the handwork has been replaced by machine. Many trimmings were made at home in the 18th and 19th centuries. Ladies in English country houses and middle-class housewives in America and other countries made trimmings for household furnishings along with their other needlework. In her classic guide for the amateur needleworker, *Encyclopédie des ouvrages de dames*, first published in 1886, Thérèse de Dillmont devoted several chapters to the making of elaborate macramé fringes and needlework trimmings. In spite of this home production, the manufacture and sale of trimmings was very profitable until the early 20th century when plain, untrimmed furnishings became fashionable, and production declined. Although plainness in furnishings is still the norm, the recent fashion for revived historical styles has meant that a wide range of trimmings is available in drapery and fabric shops at the present time.

Cord or rope is the simplest type of trim. It is stitched onto furniture edges to emphasize the shape, or it may be used as an edging for appliquéd decoration. On hangings it is sometimes used with tassels. Cord has a thicker, more opulent appearance than piping, which is similar, but is sewn into seams. In the 19th century cord was fashioned by hand on a cord wheel, a device consisting of three small wheels attached to taut threads, turned by a larger wheel that provides the necessary twist. Small cord wheels were mounted on tables for home use, while larger wheels capable of twisting very long threads were used by professionals.

Gimp, from the French word *guiper* meaning "to wrap", is a hard spun cord wrapped with silk, cotton, worsted, or synthetics to form an open braid. Handmade gimp is woven on a narrow loom using large boat shuttles. It has been used as an edge decoration on hangings. Since the late 19th century it has also been used to decorate the edges of furniture, and is now

used chiefly to cover upholstery racks. The two types of gimp are “shell”, an asymmetrical, easily curved type; and “embassy”, a stiff symmetrical type that must be applied in a straight line.

Tape and braid are tightly woven flat bands stitched onto upholstery for decoration to accentuate shape or cover seams. Tape may be woven at home on a tape, or band, loom which may be nothing more than a paddle-shaped heddle through which warp threads attached to the weaver’s waist are passed. Galloon, from the French *galon* is a narrow, closely woven tape made of gold, silver, silk, or other materials. In early 17th century France it was used for trimming clothing, but it was adopted as a furniture trim in England. Braid was originally a narrow tape of wool used as a binding or a component of more complex trims. Some early braid was plaited on long cushions and as such was the forerunner of bobbin lace. This led to some confusion of terminology in which braid was sometimes referred to as “lace”. Braid threads were wound on weights made of lead, bone, or wood to prevent tangling and were held in place by pins on the cushion. Braid made in this way was much tighter than the open bobbin lace. Braid can also be woven on looms or be made by several hand methods including crochet, tatting, or macramé.

Fringe is a decorative border of hanging threads or cords, commonly used on curtains, hangings, throws, rugs, and seating furniture. It may be used alone or embellished with beads or tassels. These embellishments add weight that is necessary for the proper draping of curtain fabrics. Of the several types of fringe the simplest are made from the loose warp ends of woven pieces. These may be knotted or left free. Simple thread fringes may be added to the edges of hangings by pulling lengths of thread through the edge of the fabric with a crochet hook and knotting. Bullion fringe is woven from twisted cord. Trellis fringe is a straight fringe that has been knotted in a macramé fashion. Campaign fringe is often made from silk and is composed of small, bell-like tassels. Ruche is a looped fringe that is sewn into seams for decoration and emphasis. Ball fringe has small fluffy balls suspended at intervals along the fringe and is commonly used on curtains.

Piping was also originally used to trim clothing, but by the end of the 17th century it was used to accent the edges of cushions and upholstery seams. Piping consists of a flat tape or bias fabric wrapped around a cord and stitched so that the edges of the tape form a flat surface that is stitched into the seam. Piping must be sewn into upholstery before it is fastened to the furniture frame. It may be very subtle or quite prominent, depending on the size of the cord, and the color contrast. In the 17th century the appearance of piping was sometimes achieved by hand-stitching cords over seams.

Tassels are often used in conjunction with other types of trimmings to add interest and a somewhat exotic appearance to curtains, cushions, and furniture. Simple tassels are threads looped double and the loop wrapped with a cord. The loop or head of the tassel may be stuffed or ornamented, and the tassel usually has a fastening cord for attachment. A separate rosette of coiled cord is sometimes used to attach the tassel to upholstery. Large tassels are formed over turned wooden or plastic moulds resembling large chess pawns, and may have several tiers of bands, or ruffs, with added ornamentation.

During the Renaissance trimmings were used on beds and

portières in Italy, France, and England. Ropes and tassels were used to hold back bed curtains and ornament pelmets. By the time of Louis XIV (reigned 1643–1715) passementerie was used on all the new decorations in the French royal residences. Throughout Europe trimmings were an important addition to 17th-century upholstery, which was often poorly executed. Upholstery fabric was woven on narrow looms and had many seams or joins that required covering for the sake of appearance. The trimmings, made mainly of wool, silk, and linen, were delicate and lively in effect. They demonstrated the ingenuity of the trimmers in disguising seams, finishing off upholstery, and edging curtains and tapestries. Rosettes, ribbons, cords, tassels, and many kinds of complex embellished fringes were also used. Elaborate trellis fringes were used on bed hangings.

Many passementiers were among the Huguenots who fled France in the late 1600s to escape religious persecution. They settled in England, Ireland, Germany, Switzerland, and the Netherlands and plied their trade in the furniture and drapery workshops of those countries. As a result of this diffusion of French craftsmen, there was a wide range of sophisticated trimmings produced in 18th-century Europe. These included bands of gold-colored lace, gold galloon, artificial flowers, bows, ribbons, and tassels. Taste in upholstery favored more restrained trimmings with emphasis on the fabric itself, and narrow braid or piping was often more appropriate than the elaborate fringing of the previous century. Tape was important in emphasizing configurations of hangings and upholstered furniture. In France there was great concern for detail with braid, fringe, and tassels being important components of seating furniture.

Neo-Classical styles used silk trimmings, with violet, yellow and brown being fashionable colors. Tassels became smaller and were sometimes decorated with bows. Swagged drapery bordered with fringe and arranged in layers became popular in France and spread to other countries, including America, where window curtains had not been in common use. Satin-covered circular trimmings edged with braid called macaroons were used on curtain tie-backs or in conjunction with tassels. Furniture upholstery often had boxed edges with contrasting piping.

In the early 19th century trimmings for curtains became heavier. In some instances, the fringing was made up of wooden pendants wrapped by hand in silk or wool and decorated. Some fringing was delicate and knotted. Delicate braidwork in contrasting colors was also applied to curtains. Empire furniture had contrasting braid trim and tasseled cushions.

By the mid-19th century trimmings had become rich and ornate. Seating furniture was heavily upholstered and required equally substantial trimmings. Drapery was also heavily trimmed. Elaborate window valances, or lambrequins, had scalloped gimp edgings and were ornamented by heavy cords and tassels. These trimmings increased the rich effects of the lambrequin. Gimp was appliquéd in ornate patterns, fringe was sewn along the hem, and tassels hung from specific points in the design. Large braid and multi-colored gimp were popular. Fringes were deep and topped with braids having geometric patterns or appliquéd flowers. There were ornate bullion and ball fringes, including Persian fringe which had a wide border with gradated balls. Contrasting lines, corded

edges, and dark silk fringing were features of the period. Bell pulls with braided edges, appliquéd centers and tassels were much in vogue.

Late 19th century designers, particularly the English writer Charles Locke Eastlake in his *Hints on Household Taste* (1868), advocated reform and simplification of the ornate styles of the period, but did not discourage tasteful trimmings that were in keeping with the style of the room. Among the reformers there was some disapproval of heavy fringes and pendants, but the Gothic revival and oriental-style interiors being advocated required embellishments of their own, particularly embroidered bands and tapes applied to borders of curtains and hangings. Portières were in widespread use, and could be made to resemble window curtains or sometimes were made entirely of fringe or strings of beads. Bed curtains were reduced to fringed half-testers or dispensed with entirely.

Modernist and Art Deco styles of the early 20th century demanded less ornamentation. Braids were straight with geometric motifs, and they became smaller and neater as the century progressed. By 1920 elaborate and complex draperies had been replaced by simple fringed curtains. Crochet work was used on fringes, and tassels were smaller than in previous centuries. Some tassel heads were made of cut glass.

Late 20th century furniture and draperies generally have little ornamentation. An exception is the Country House style in England and America which is characterized by large, fringed overstuffed chairs and sofas, and swagged curtains with deep bullion fringes and braid. Country house designers have also revived the tester bed with imaginatively trimmed curtains and valances. Period revivals and restorations make generous use of trimmings, although the elaborate handwork of the past has become a lost art.

CONSTANCE A. FAIRCHILD

Selected Collections

Important collections of Passementerie are in the Victoria and Albert Museum, London, the Musée des Arts Décoratifs, Paris, the Society for the Preservation of New England Antiquities, Boston, the Metropolitan Museum of Art, New York, and the Winterthur Museum, Delaware.

Further Reading

The most recent surveys of the history of Passementerie are the catalogue of the Musée des Arts Décoratifs exhibition 1973 and Donzel and Marchal 1992. Both are extensively illustrated and include bibliographies and a guide to French museum collections. A useful English-language introduction to the history of fringes and other upholstery trimmings is Jackson 1987.

Pattern Books

The definition of pattern books varies and can comprise manufacturers' sample books, traders' catalogues and compendiums of a wide variety of designs, although they are generally distinct from journals and magazines that might incidentally publish designs. A distinction should also be drawn between architectural pattern books and design books. The former were intended for gentlemen and their builders and would initially include details of architectural features, although by the end of the 18th century they would illustrate complete interiors as well as buildings and landscapes. The range of material that would be found in pattern books varied, but would often include cabinet, upholstery and chair designs; mirrors and pier glasses; sconces and candelabra; picture frames; and architectural details especially the Orders, as well as detailed instructions for drawing and perspective work.

While the history of fashionable interiors may be traced with pattern books, many ran into a number of editions revealing the persistence of certain designs over long periods. They also bear witness to the dissemination of designs across countries and periods. The pattern books were intended for clients, architects, and craftsmen, but they should not be seen as being definitive statements of taste. Indeed the changing nature of taste and the process of personalisation or adaptation of particular patterns is evident in extant objects that very often bear a resemblance to a pattern but is not a slavish copy of it. In these cases, it seems that the clients or their suppliers wanted to follow a trend without being subservient to it. The development of a visual culture in which the results could be envisaged before being built, was therefore one of the lasting benefits of pattern and design books

Engravings of designs had been available for many years (e.g., Serlio and DuCerceau) but the deliberate compilation of patterns into book form seems to have occurred in the late 16th century. The prolific designer, Hans Vredeman de Vries executed *Differents Pourtraicts de Menuiserie* (1587) and this is considered to be the earliest furniture pattern book. His son Paul also produced a furniture pattern book, *Verscheyden Schrynwerck*, published in Amsterdam (1630).

The *Livre d'Architecture* by Jean Barbet (1632), helped to establish France as a leader in interiors as it showed designs for chimneypieces, which were a major feature of room decoration. Jean Le Pautre helped create the Louis XIV style by publishing over 2,200 plates between 1657 and 1680. His Baroque style and that of his master Le Brun was disseminated throughout much of Europe, having been published in London, Amsterdam, and Nuremberg.

Pattern Books: designs for furniture by Hans Vredeman de Vries, late 16th century

Pattern Books: engraving from *A New Book of Ornaments* by Matthias Lock, 1752

French influence continued with the publication of designs by Nicolas Pineau, in Mariette's *L'Architecture Française* (1727–38). Other Pineau designs were introduced in Mariette's *Architecture à la Mode*. Jacques-François Blondel developed the Rococo style in his *De la Distribution des Maisons de Plaisance et de la Décoration des édifices en général* (1737).

In England, John Carwitham published the well-known *Various Kinds of Floor Decorations* (1739). This comprised delightful perspective scenes showing floor plans useful for marble or floor-cloth patterns. In the following year Batty Langley produced *The City and Country Builder's and Workman's Companion* (1740), which included some designs in the Kentian manner mixed in with French Rococo designs, lifted from Nicolas Pineau. Other editions of this work were published with additional plates in 1741, 1750 and 1756.

The mid-18th century was a heyday for pattern books. William De La Cour's *First Book of Ornament* (1741) showed plates of ordinary chairs while Matthias Lock published his *Six Sconces* (1744) and *Six Tables* (1746). All show a confident

handling of the Rococo motifs some time before their general popularity. In 1752 Lock published *A New Book of Ornaments* in collaboration with H. Copland, and this was re-published in 1768.

The publication of Thomas Chippendale's *The Gentleman and Cabinet-Maker's Director* (1754) is always seen as a seminal work. Offered both to private customers and the general trade, it included many items of cabinet furniture, as well as the more standard entries of pattern books of the time. In 1755, the *Director* was published in a second edition – almost the same as the first – and in 1762 a third, fully revised edition was published. A French version was issued simultaneously.

Although Chippendale included Chinese designs, it was Sir William Chambers who promoted the taste for the Orient in his *Designs of Chinese Buildings, Furniture, Dresses, and Utensils* (1757), also in a French edition. Chambers's importance was in providing first-hand knowledge of Chinese designs, when most representations of the Orient were fanciful and frivolous. He hoped his work "might be of some use in putting a stop to the extravagancies that daily appear under the name of Chinese".

Matthias Darly, an engraver and drawing master, published *A New Book of Chinese Gothic and Modern Chairs* (1751). This comprised eight plates of rather eccentric chairs. However, like other designs they were resurrected: in this case by Manwaring in his *Chair-maker's Guide* as late as 1766. Darly continued to be productive, publishing various design books in a variety of tastes including *A New Book of Ceilings* (1760). His last work was *A New Book of Ornaments in the Present (Antique) Taste* (1772) which was among the first to show ornament in the Neo-Classical style. His oeuvre therefore covers most of the main stylistic trends of the century.

Pattern book publishing seems to have been profitable. In 1760, a publisher, Robert Sayer, produced *Household Furniture in Genteel Taste* which ran to four editions intended for artisans as a copy book.

Furniture-makers continued to produce pattern books themselves. In 1762 Ince and Mayhew published *The Universal System of Household Furniture* which was designed as an advertisement of their skills as well as a challenge to Chippendale's *Director*. In 1765 Robert Manwaring brought out *The Cabinet and Chair-Maker's Real Friend and Companion*; this was a chair pattern book with designs in the Rococo, rustic, Chinese, and Gothic tastes.

The Neo-Classical style was presented by a wide range of pattern books. In France, Gilles Paul Cauvet published *Recueil d'ornements à l'usage des jeunes artistes qui se destinent à la décoration des bâtiments* (1777), while in England *The Works in Architecture* (1779) by Robert and James Adam as well as Hepplewhite's *The Cabinet-Maker and Upholsterer's Guide* (1788) promoted the style. The influence of Adam on artisans was found in the *The Cabinet-Maker and Upholsterer's Guide*, re-issued in 1789, with a third edition offered in 1794. This popularity was perhaps based on the representations of furniture that were not high style, but were quite conservative, modest not modish items.

Towards the end of the century Thomas Sheraton published his *The Cabinet-Maker and Upholsterer's Drawing Book*. The first edition appeared in fortnightly parts between 1791 and

1793, with a second edition in 1794 and a third in 1802. The influence of this pattern book was widespread, both in the English trade and abroad. A German edition of the work was published in 1794, and it was widely known in America.

A more archaeological classicism was presented in pattern books produced by Percier and Fontaine. In 1801 they published *Recueil de décorations intérieures* with a second edition in 1812 showing a fully developed Neo-Classical style. Parallel with this work was Thomas Hope's *Household Furniture and Interior Decoration Executed from Designs by Thomas Hope* (1807).

Although not strictly a pattern book, Rudolf Ackermann's *Repository of Arts* (1809–28) is important. It published architectural designs by J.B. Papworth, and furniture designs by George Smith, as well as textile designs and curtain plans. In 1823 *Fashionable Furniture*, an anthology of the *Repository's* furniture designs was produced.

The Grecian taste was propagated by George Smith's *A Collection of Designs for Household Furniture and Interior Decoration* (1808), and his last work, *Cabinet-Maker's and Upholsterer's Guide, Drawing Book and Repository* (1826), included Egyptian, Gothic and Louis designs. The Roman taste was specifically met by Charles Heathcote Tatham's *Etchings of Ancient Ornamental Architecture ...* (1799). This was clearly successful as it was reprinted in 1803, 1810, 1826 and 1843.

As the demand for fashionable interiors grew apace in the 19th century, pattern books proliferated, as did the range of styles. The Gothic style was encouraged by Augustus Charles Pugin's *Specimens of Gothic Architecture* (1821 and 1823), and his son A.W.N. Pugin published *Gothic Furniture in the Style of the 15th century* (1835) and *Designs for Gold and Silversmiths, Designs for Iron and Brass Work and Details of Antient timber houses* (1836).

Gothic and Elizabethan furniture and metalwork patterns were supplied in Henry Shaw's *Specimens of Ancient Furniture* (1836); Richard Bridgens published *Furniture with Candelabra and Interior Decoration* (1838) comprising Grecian, Elizabethan and Gothic designs.

The eclectic nature of tastes was catered for by designers such as Henry Whitaker and Thomas King. Whitaker's *Designs of Cabinet Upholstery Furniture in the Most Modern Style* (1825) incorporates late-Grecian and early Rococo revival patterns, while his *Practical Cabinet Maker and Upholsterer's Treasury of Designs* (1847) includes most of the fashionable styles. Between 1829 and 1839, Thomas King devised fifteen pattern books for interior work. These include *The Modern Style of Cabinet Work Exemplified* (1829), *Designs for Carving and Gilding* (c.1830), and *The Upholsterer's Accelerator* (before 1835). Yet again the longevity of pattern books can be seen in the reprint of Whitaker's *Modern Style* in 1862. Henry Arrowsmith produced *The House Decorator's and Painter's Guide* (1840), which again included some furniture designs that represented the variety of tastes at that time.

Most of these pattern books would have been available in America, but in 1840 John Hall of Baltimore offered *The Cabinet Makers Assistant* which had designs in a scrolled Grecian style.

French influences continued with works such as Thiollet

and Roux's *Nouveau Recueil de Menuiserie et de Décoration Intérieures* (1837) and La Pinsonnier's *Recueil des Draperies d'Hallévant ...* (1839). Jules Verdellat's *Manuel géométrique du Tapisier* (1864), was an important example of the extensive business of designing and publishing patterns, diagrams, and cutting instructions for curtain and window treatments, and furniture was available in books such as *Album du Menuisier Parisien* (1855–61), and *Le Menuisier Moderne* (1860). Later works include César Daly's *Décorations intérieures peintes* (1877).

The insatiable demand for examples of designs and patterns is clear. In 1877 the *Furniture Gazette* published a bibliography of more than 400 books, most of which were pattern and design books. Trade magazines published weekly or monthly digests of designs, and publishers re-issued famous pattern books. Sheraton's *Drawing Book* was re-published in 1895, and in 1897 Hepplewhite's *Guide* was revived, while reprints of Chippendale's *Director* are found from 1900.

Pawson, John 1949–

British architect and interior designer

Widely regarded as the High Priest of Minimalism, John Pawson actually dislikes this label intensely. He considers it to be a journalistic phrase coined for the 1970s art movement which cannot possibly encompass the broader meanings and ideas behind the term. But alternative descriptive words such as simple, restrained, perfectionist and careful are equally insufficient so, in order to be understood, Pawson has grudgingly had to accept this label so that he can be placed within a chosen category. Like Modernism, Minimalism is more than just a passing fashion or style, but whereas Modernism implies a devotion to the aesthetics of the machine age and the exploitation of its potential, Minimalism has a spirituality which in a sense rejects many of Modernism's materialist values and denotes a complete way of life. Thus, Pawson's interiors create a strong impression not only on the eyes but also the psyche, and the silence and sparseness of his designs can be a rare, uplifting and pleasurable experience.

Born into a wealthy family in Halifax, Yorkshire, Pawson was originally expected to follow in his father's footsteps and become an industrialist. However, after spending seven years in the family's clothing business (W.L. Pawson & Son) and finishing as head of the design department, he decided to leave the comfort and security of his Yorkshire roots for a period of study and self-discovery in Japan.

Pawson spent four years in Japan teaching English at Nagoya University and learning how the Japanese focus on only "that bit" of life which has a calming effect. This period helped to formalise feelings relating to design that he had already experienced but which he did not fully understand, and in Japan he found a culture which historically adhered to an aesthetic of simplicity, harmony and perfection. He claims that from an early age he had always been interested in the notion of "voluntary poverty" or the Zen word *Wabi* – a Japanese word for the idea that to be without possessions is to possess the world. But the paradox of this idea, as Pawson has gone on to highlight, is that the fewer objects one has, the more important it is that the quality of the objects is just right. Simplifying one's life is not an easy option; it requires self-discipline and restraint.

At Nagoya University Pawson came into contact with several Japanese architects, the most significant of whom was Siro Kuramata who was to become his mentor and who encouraged him to study architecture at a relatively late stage at the Architectural Association in London. The Architectural Association has a long tradition of encouraging imagination and ideas rather than concentrating on the nuts and bolts of

the building process. Whether this ethos was rigorous enough for Pawson's developing Minimalist style remains open to debate, but when opportunities arose to take up commissions he gave up his studies before fully qualifying as an architect. He formed a team with Claudio Silvestrin and John Andrews with whom he had already designed his first sparse interior – a flat for himself.

A fortuitous relationship with the art dealer, Hester van Royen, introduced the team to the elite of the London art world and provided them with the contacts which led to the design of a small office for van Royen at the Waddington Gallery and then to the design of Waddington's main galleries at 11 Cork Street. Hester van Royen also introduced Pawson to the renowned travel writer, the late Bruce Chatwin, and his wife for whom he designed an apartment in Eaton Place. Chatwin once described Pawson's interiors as "rooms in which to dream", an astute analysis of spaces where ideas come flooding in. The mind is given the freedom to wander unhindered in rooms devoid of domestic clutter, irritations and distractions.

Pawson's reputation grew rapidly, fuelled by the preference for white-spaced chic that dominated more progressive tastes during the mid- and late 1980s. Commissions poured in, including the PPOW Gallery in New York, an American art collector's flat in Knightsbridge, and Wakaba, a Japanese restaurant on London's Finchley Road, where a curvilinear wall of acid-etched glass propels the diner into a large, open room of blank, white walls, with not a lintel or skirting board in view. This façade of acid-etched glass is repeated in Pawson's Cannelle Patisserie in the Fulham Road, where a small, clear glass box is cut into the middle of the translucent wall to hold one perfectly formed cake.

It was possibly the completion of a villa in Majorca for the German art dealer Hans Neuendorf that provided Silvestrin and Pawson with the level of exposure and financial freedom they needed fully to explore their Minimalist ethic. The stark yet majestic villa exalts the spirit and makes the notion of living in Minimalist spaces seductively compelling. At the same time the commission exemplifies Pawson's commitment to restraint, and the reluctance to compromise that eventually led to the parting of the team and to Pawson choosing to work independently.

Pawson's Minimalist approach to design has been described as interior architecture without: without decoration or colour, without furnishings, and without details. His work is constructed through steady subtraction and sacrifice, and he finds definition in the virtualities of a walled box reduced to its primary elements: line, surface and volume coupled with light, dimensional and proportional relations, and specific textural qualities.

Pawson's Minimalism is of the European variety, where what passes for austerity is actually a complicated process that demands painstaking labour, craft and a deep understanding appreciated by the observant eye. This insistence on expressing the essence of things has an almost mystical quality of the kind present in the early works of Mies van der Rohe or the Mexican architect Luis Barragán, with whom Pawson has often been compared.

Of Pawson's recent interiors, his Calvin Klein store off Madison Avenue, New York (1995), his Jigsaw shop on Bond

Pawson: Jigsaw Shop, Bond Street, London, 1996

Street, London (1996), and his own home in Notting Hill (1994), probably best exemplify his approach to design.

In the Calvin Klein store, he has created a shopfront of overwhelming proportions that is a dramatic expression of monumentalism. Situated in the former Morgan Bank building on the corner of Madison Avenue and 60th Street, the store measures 20,000 square feet. On entry, the shopper is confronted by soaring Ionic pilasters which punctuate the 34-foot-high panes of glass, creating a crystalline street corner where all three floors of the interior are flooded with shifting pools of light. Internally, the floors stop a foot short of the windows, which appear to flow down the building like water. As with the Jigsaw store, customers leave behind the noise and stress of the street scene and enter a haven of calm and quiet luxury.

In the Bond Street branch of the Jigsaw fashion chain, Pawson replaced the old tunnel-like entrance with a new façade. This was constructed out of Portland stone and bronze-framed glass that was brought up to the line of the pavement, with part of the first floor being cut away to create a six-metre high space, stretching back to a secondary façade on the line of the old one. This ingenious design solution results in a double-height gallery – a sharply modelled space of shadows and shifting light.

The most remarkable aspect of Pawson's work is not just his attachment to geometric forms but also his use of light and natural materials, such as stone and wood, which suggest an appreciation and sensitivity to drama. He delights in the nature of materials and fundamental oppositions; between dense mass and the ethereal, and between the opaque and the transparent. His refusal to compromise sets him apart from his colleagues and makes him more like an artist than most other architects.

AMANDA BIRCH

Biography

Born in Halifax, Yorkshire, 6 May 1949. Educated at Eton College, 1962–67. Lived in India and Australia, late 1960s; worked in the family textile mills, W.L. Pawson & Son, for seven years; English teacher, Nagoya University, Japan, 1974–78; studied at the Architectural Association, London, 1978–81. Established architectural practice with Claudio Silvestrin and John Andrews; in partnership with Silvestrin, 1987–89; independent practice since 1989. Has two sons. Lives and works in London.

Percier, Charles 1764–1838 and Fontaine, Pierre-François-Léonard

1762–1853

French architects

Arguably the most celebrated and influential of any French designers active in the late 18th and early 19th centuries, the names of Charles Percier and Pierre-François-Léonard Fontaine are synonymous with the architecture and decoration of the Empire period. The two first met as young men, probably through Antoine Peyre, and within a short time they were both studying in Rome where Percier had gone as a recipient of the Grand Prix in 1786. They made reconstructions on paper of the Antique monuments, but they also studied and recorded Renaissance palaces, villas and gardens, publishing the results in 1798 in *Palais, Maisons et Autres Édifices Modernes Dessinés à Rome*. Evidently, like many of their contemporaries, they were impressed by the Villa Albani. They returned to Paris where the mania for Antiquity had already begun to influence late Louis XVI taste on the eve of the Revolution. In 1793, possibly on the recommendation of Georges Jacob, the leading *ébéniste*, they were commissioned to design furnishings in whatever they interpreted as the *style republicaine* for the Salle de la Convention newly set up in the damaged Tuileries Palace; predictably it would be in the Antique taste.

Fontaine went to work in England for a while, but Percier stayed in Paris during the Revolution and assisted Louis-Martin Berthault in designing the greatly admired bedroom for Mme. Récamier. This incorporated many images of Antiquity, but not as many as the published designs made by Percier and Fontaine (who had returned from England) for a studio for a painter identified only as C.I., a bedroom for Citoyen V, and

Percier and Fontaine: Empress Josephine's bedroom, with bed by Jacob-Desmalter, Château de Malmaison, 1812

another for M.O. which is likened to a temple of Diana. The linear style in which their designs were reproduced in their *Recueil de décorations intérieures* cannot do justice to what must have been beautifully soft and shaded rooms with painted wall draperies. A much more sympathetic effect is created in a design for a bedroom by Percier dated 1798 which is in a private collection but reproduced in Peter Thornton's *Authentic Decor* (1984, plate 243).

During the Consulate Percier and Fontaine were employed to restore for use the emptied royal palaces, generally in collaboration with the Jacob family who made the furniture. More importantly, in 1799 they were appointed by Napoleon, who had just become First Consul, to remodel and decorate Malmaison, the property at Rueil outside Paris which he had bought for his wife Josephine. Fontaine's journal records the progress of this work, which still largely survives, although it has undergone several restorations. The military theme befitting a soldier is strong at the outset in the vestibule "in the form of a tent" which Napoleon likened to "a cage for animals to be shown at a fair". This leads into a hall with walls painted in imitation of marbles, porphyry and granite, with gilded military trophies. Here the architects ingeniously made use of "moving mirrors, with or without silvering, so as to make, so

to speak, a single room out of the three forming the main building".

Like everything ordered by Napoleon, the work at Malmaison had to be executed at great speed. The Council Chamber in which, Fontaine wrote, "it seems suitable to adopt ... the form of a tent supported by pikes, fascies and standards, between [which] hang trophies of weapons recalling those used by the most famous warlike people in the world" was constructed in ten days. The Library too was completed in a short time. This is divided into bays separated by coupled mahogany columns supporting arches and a vaulted ceiling painted with portraits of classical authors; in the centre are the figures of Apollo and Minerva, presumably intended as a compliment to the First Consul and his wife. Napoleon's ungrateful comment was that "it looked like the sacristy of a church". The Dining Room is Pompeian in style with panels of grisaille figures of dancers by the artist Pierre-Paul Prudhon, while the Music Room is an example of the relatively chaste decoration of the Directoire and the Consulate, just hinting at the elaboration that was so quickly to succeed it. Its original appearance, including an extension (now demolished) beyond the glazed doors at one end, is recorded in a watercolour by Auguste Garnerey.

Despite Napoleon's comments about some of the rooms at Malmaison, he continued to patronise Percier and Fontaine, nominating them *Architectes du Gouvernement* in 1801. They designed the magnificent throne for his coronation as Emperor in 1804, as well as other decorations for the ceremony in Notre Dame, all of which are included in a publication they made in 1807. In 1804 they were appointed *Architectes du Louvre et des Tuileries*, the two palaces Napoleon intended to join so as to make the largest in Europe. In the Louvre they built a magnificent staircase (destroyed by Napoleon III) and made changes when a part of the palace became the Musée Napoléon. For the Tuileries they created a range of splendid apartments which were all destroyed in the Commune uprising in 1871, but something of their quality can be assessed from plates and descriptions in their publications.

The Dining Room at the Tuileries seems to have been modelled in form on the library at Malmaison with bays separated by coupled columns supporting arches which, like the vaulting, were covered with grisaille arabesque decoration; mirrors repeated "to infinity the richness of the ceiling ... adding to the magnificence but also to the light in the room" (which had only one window). The Salle des Gardes had similar decorations, but with Mars as the principal subject and other military allusions. The Salle des Maréchaux had copies of Jean Goujon's caryatids in the Louvre in the centre of one wall, and there were large paintings of Napoleon's victories, full-length portraits of the Marshals, and a regular display of busts of generals and admirals. The architects called it "le premier salon du palais", but it is difficult to believe it was superior to the Salle de Spectacle which Fontaine recorded in a watercolour of the banquet celebrating Napoleon's marriage to Princess Marie-Louise. Another illustration shows the Imperial couple in the Salle du Trône, seated on gilded thrones upholstered in embossed purple velvet, placed beneath a baldacchino consisting of a gilded crown, surmounted by a helmet and white plumes; the draperies or mantling were of embroidered crimson velvet lined with purple silk. A very similar throne was made for Fontainebleau; that still exists. Some of these watercolours by Fontaine of the marriage celebrations were later used as the basis for engravings in the 1812 *Recueil*. Another set of watercolours of the decorations and furnishings of the apartments in the Tuileries was commissioned by the Tsar Nicholas I; and, dispatched at various times between 1810 and 1815, they seem to have provided a model for some of Karl Rossi's work at Pavlovsk and the Winter Palace at St. Petersburg.

The importance of Percier and Fontaine's *Recueil* cannot be overstated, and it was arguably more influential than any other pattern book or set of engravings of interiors of the period. It contained a collection of their designs for furniture and decoration which became a source for contemporary designers in many other European countries – England, Prussia and Russia as well as those parts of the Continent overrun by Napoleon and subject to French rule. It was also an influence that persisted in France, since none of Napoleon's successors until Napoleon II had much interest in such matters. Most of the designs are in the Antique taste, although three are Egyptian. But the book also includes a valuable "Discours préliminaire" in which the authors set out their design principles and stressed the overall control that should be exercised by the architect:

"furniture is too much a part of interior design for the architect to remain indifferent to it". The basis of these principles, as they affirm repeatedly in this introduction, is Antiquity, and furnishings as well as architecture demonstrate "des lignes simples, des contours purs, des formes correctes". Correctness is a key word: in the set pieces every item is carefully placed and the interiors are more like exhibitions than rooms in which to live. Although the importance of practical considerations and the functional character of furniture is not ignored, they place great emphasis on the relationship between architecture, decoration and the placing of furniture, implying that in their interiors nothing could be added and nothing taken away: "the structure and the decoration are closely connected; and if they cease to appear to be so there is a defect in the whole". These words might almost have come from the young Pugin.

Charles Percier: born in Paris, 22 August 1764. Studied at Bachelier's Ecole Gratuite de Dessin; trained under the architect Antoine Peyre (1739–1823) at the Ecole des Beaux-Arts, where he met Fontaine in 1779. Awarded the Grand Prix for architecture, 1786; in Rome, 1786–92; returned to Paris, 1793. Worked in close collaboration with Fontaine, designing furniture, carpets, porcelain, bronzes, silver and other articles of decoration, from 1793. **Pierre-François-Léonard Fontaine:** born in Pontoise, near Paris, in 1762, the son of an architect and hydraulic engineer. Studied in Paris at the Ecole des Beaux-Arts under Antoine Peyre, and under Jean François Heurtier (1739–1822). Travelled to Rome and worked as a painter of topographical views, 1786; returned to Paris, 1791; worked as a designer in England, 1792; collaborated with Percier from 1793. The two formed a professional partnership until 1815 and designed decorations, furniture and complete interiors under the Republic and Empire. Published several collections of designs including *Recueil de décorations intérieures*, 1801. Made joint *Architectes du Gouvernement*, 1801; *Architectes du Louvres et des Tuileries*, 1804. Fontaine made *Premier Architecte du Roi* to Louis XVIII and practised independently from 1815 (retired 1848). Percier taught architecture at the Ecole des Beaux-Arts, 1815–38. Percier died in Paris, 5 September 1838; Fontaine died in 1853; buried in the same grave.

Selected Works

A collection of Percier's Italian drawings is in the Bibliothèque, Institut de France, Paris; several of his designs for furniture are in the Musée des Arts Décoratifs, Paris. The best surviving examples of Percier and Fontaine's interiors can be seen at Malmaison, Paris; numerous additional interiors are illustrated in the *Recueil*.

Interiors

- 1793 Salle de la Convention, Tuileries, Paris (furniture)
- 1798 Mme. Récamier's Bedroom, Paris (furnishings and decoration by Louis-Martin Berthault, assisted by Percier)
- 1799–1800 Château de Malmaison, Rueil, near Paris (remodelling of interiors, decorations and furnishings)
- 1804 Notre Dame, Paris (decorations for the coronation of Napoleon)
- 1804 Saint-Cloud, Paris (interiors and furnishings)
- 1804–12 Tuileries, Paris (interiors and furnishings, including the Salon of Mars, Gallery of Apollo, Salon of Diana and private apartments)
- 1804– Louvre, Paris (staircase, and remodelling of Musée Napoleon)

Perino (or Pierino) del Vaga 1501–1547

Italian painter, designer and stuccoist

Primarily a designer and draughtsman, Perino del Vaga was also a fresco painter and stuccoist, known for combining sculpture with Mannerist painting. Characteristic of Perino's work is an ornate interlacing of arms and the use of swags and masks. Born in Florence in 1501, son of the impoverished Giovanni Buonaccorsi, Perino was initially apprenticed to an apothecary before being sent to an insignificant painter, Andrea de' Ceri, and later to Ridolfo del Ghirlandaio, son of Domenico, where he outshone other pupils. Perino was taken to Rome by a Florentine painter "del Vaga", whose name he assumed, and he attracted the attention of Raphael. Studying

antique sculptures, he acquired a thorough knowledge of anatomy.

From 1516 to 1520, as one of Raphael's leading pupils alongside Giulio Romano, he worked on the grotesque and fresco decorations of Raphael's major Roman works, including the Vatican loggias commissioned by Pope Leo X and completed in 1519, where he gained a reputation for his design, colouring and finish. Decorations on the vaulting included the Jews crossing the Jordan, and the fall of the walls of Jericho. For the Vatican's Hall of Popes Perino worked with Giovanni da Udine (1487–1561), the director for stucco and arabesques, dividing the area into the seven planets drawn by their representative animals – Mars by wolves, Saturn by serpents for example – signs of the Zodiac and 48 images including the Great Bear and Dog Star. A central circle contained the Victories holding the Pope's keys, foreshortened from below and delicately draped. Other works from this period include, in 1516, antique illusionist decorations in the Villa Farnesina's Sala delle Prospettive, which used painted perspective devices to simulate the interior of a temple. Above a colonnade, the theme of Metamorphoses was depicted in antique style, favouring design rather than realism and stretching classical conventions.

For the Servite church of S. Marcello al Corso, rebuilt after its destruction by fire in 1519, Perino completed restoration work on two chapels. For the altar wall of one, now disappeared, St. Joseph and St. Philip were painted in niches either side of the altar. Above them were putti holding the ends of two festoons running to the corners of the chapel. Painted in bright colours, these were considered by the Renaissance biographer and painter Giorgio Vasari to be the finest and most realistic frescoes ever produced. They survived for less than half a century.

Raphael died in 1520, and work in the Vatican's papal apartments (*stanze*) was continued by Perino del Vaga, Giulio Romano and other followers of Raphael. The new Roman style showed a muting of classical antiquity and the exploitation of illusion.

Perino's works from this period included a garden design for the Archbishop of Cyprus in Rome – figures, arabesques and landscapes – a frescoed hall in the Palazzo Baldassini near S. Agostino (now in the Uffizi, Florence) where Perino divided the space with pilasters and niches containing philosophers and putti, painted to simulate marble. Above the cornice were scenes of Roman achievements. In 1523 Perino returned briefly to Florence where he was influenced by the Tuscan Mannerists, declaring *bella maniera* capable of surpassing even the achievements of Masaccio.

The Sack of Rome in 1527 resulted in the deaths of many artists and the destruction of many works. Perino fled to Genoa where between 1528 and 1537 he introduced new life to Genoese art, undertaking what is possibly his major achievement, the decoration in stucco, frescoes and oil paintings of the Palazzo Doria on the coast of Liguria for Prince Andrea Doria, Admiral of the Pope's fleet. The marble Doric entrance was designed by Perino with pedestals, capitals, architraves and women holding arms. The stucco vaulting had scenes and arabesques; arcades containing squires fighting on foot and horseback. Staircases were embellished with antique arabesques, small figures, scenes, masks, children and animals

and upstairs a loggia had a stone door at each end over which were painted a man and a woman. Five-arched vaulting was decorated with stucco and oval compartments containing idyllic landscapes, the walls painted to ground level with portraits, real and imaginary, representing the Doria family, their motto in large gold letters. Sadly, this ceiling decoration, said to have been in oil rather than fresco, had deteriorated by the early 17th century due to the reaction of oil with quicklime. A drawing in the Louvre, reputed to be preparatory to this work, depicts the Shipwreck of Aeneas, with iconographical references to Andrea Doria, who hoped possibly to identify himself with Neptune. The stucco ornamentation on the vaulting of the first hall depicted the large scene of the shipwreck with figures, live and dead, ships caught in the storm, tumultuous clouds and waves. Neptune with his trident helps Aeneas to overcome the sea and continue safely to Rome.

To the right of the loggia were fresco and stucco figures of Jupiter subduing the giants. Decorations in four rooms represented the fables of Ovid. Executed two years after Perino's arrival in Genoa was the Sala dei Trionfi. A sketch in Turin's Palazzo Reale shows Perino's original design for the ceiling, with spandrels surrounding a rectangular ceiling decoration; painted Olympian gods and goddesses, largely derived from those represented by pupils of Raphael in the Farnesina. Perino's style changed during his work on the Palazzo Doria, showing increasing use of stylized and formal surface pattern which led on to the Mannerist style of his decorations for Castel Sant'Angelo.

In July 1534 Perino returned to Pisa and bought a house there, dividing his time between work on the Pisa Duomo and Genoa, where in 1534 he produced a Nativity for the Capella Basadonne in S. Maria della Consolazione. In 1538 he reputedly returned to Rome where he strengthened the Raphaellesque element in Roman style, decorating churches and chapels. For the walls of the Pietro de'Assimi chapel in la Trinità, Perino used arabesques, some in bas-relief, others painted. Two scenes were enclosed within an elaborate stucco frame – the Pool of Bethesda, with a foreshortened view of the portico, and the resurrection of Lazarus emphasizing the use of perspective. From 1542 to 1547, towards the end of his life, he became Pope Paul III's official painter in the Vatican Palace and Castel Sant'Angelo where he produced important frescoes in the Mannerist style, which show greater surface organisation. Other works from this period include stucco decoration for the Vatican's Sala Regia.

A number of Perino's drawings can be found in the Uffizi, Florence and London's Victoria and Albert Museum. Perino del Vaga was particularly skilled at drawing in chiaroscuro, and his favourite medium was pen and ink and wash on tinted paper, heightened with white.

In addition to his decorative interiors, Perino also prepared drawings for galleys to be carved by Carota and Tasso of Florence and richly decorated designs for standards, together with cartoons for Florentine needle paintings. His drawings were used for a casket with 25 rock crystal crosses deeply carved to represent the life of Christ, executed in 1537 by Valerio Belli (c.1468–1546) for Clement VII.

Biography

Born Pietro Buonaccorsi (or Bonaccorsi) in Florence in 1501, the son of Giovanni Buonaccorsi. Trained under Andrea de' Ceri and Ridolfo del Ghirlandaio. Probably went to Rome with an unidentified painter "del Vaga", whose name he assumed. One of Raphael's principal pupils on the decoration of the loggias at the Vatican, 1518–19; continued to collaborate with Raphael on grotesque and fresco decoration for all his major Roman commissions, c.1516–20; moved to Florence on account of the plague in Rome, 1523; independently active on palace decoration in Genoa for the Doria family, 1523–36, with a period in Pisa, 1534–36. Returned to Rome, 1538, and worked on church and chapel decoration; official painter for Pope Paul III in the Vatican Palace and at the Castel Sant'Angelo, 1542–47. Furnished designs for rock-crystal carvings for Giovanni Bernardi's *Farnese Casket* (now in Capodimonte, Naples). Married Caterina Penni: 1 daughter. Member, Accademia dei Virtuosi; buried in their chapel in the Pantheon. Died in Rome, 19 October 1547.

Selected Works

A large collection of Perino del Vaga's designs are in the Uffizi in Florence, and at the Victoria and Albert Museum, London.

- 1516–17 Loggetta of Cardinal Bibbiena, Vatican Palace, Rome (grotesque ornament): Cardinal Bibbiena
- 1517–19 Vatican loggias, Rome (grotesque decoration in collaboration with Raphael and Giovanni da Udine): Pope Leo X
- 1518–20 Villa Madama, Rome (grotesque stucco decoration, in collaboration with Raphael and Giovanni da Udine): Cardinal Giulio de' Medici
- 1519–22/5 Palazzo Melchiorre Baldassini, Rome (frescoes and grotesque decoration, with Giovanni da Udine): Melchiorre Baldassini
- 1520–24 Sala dei Pontefici (Borgia Apartments), Vatican Palace, Rome (vault decoration): Popes Leo X and Clement VII
- 1528–36 Palazzo Doria (or Palazzo dei Principi) at Fassolo, Genoa (including Sala dei Giganti, Loggia degli Eroi, Sala della Carità Romana, Salone del Naufragio): Andrea Doria
- c.1542 Sala Regia, Rome, Vatican Palace, Rome (stucco decoration): Pope Paul III
- 1542–47 Sala Paolina, Castel Sant'Angelo, Rome (fresco and stucco decoration): Pope Paul III

Perriand, Charlotte 1903-

French designer and architect

Despite being most often remembered as Le Corbusier's principal assistant, Charlotte Perriand remains not only one of the most significant figures of French Modernism but also one of the most influential French interior designers, whose artistic activity spans more than three-quarters of the 20th century. Trained at the Ecole Centrale des Arts Décoratifs (1920-25) under traditional French interior designers committed to an Art Deco concept of modernity, Perriand pursued her early interest in mass-produced furniture by also taking courses with Maurice Dufrene, the artistic director of the Galeries Lafayette department store in Paris. Andre Lhôte's classes at the Grande Chaumière, open to women as well as men, helped her early on to transcend the limits of the gender-biased education at the Ecole Centrale.

While a student, Perriand participated in the 1925 Exposition Internationale des Arts Décoratifs. Her first exhibition as an independent professional was at the 1926 Salon d'Automne where she showed a *coin de salon* in a conventional French Art Deco manner. The following year at the Salon des Artistes Décorateurs she showed a collection of dining room objects. Her radical move towards industrially produced metal furniture, however, occurred at the 1927 Salon d'Automne with a *bar sous le toit* which brought her instant notoriety. The same year, on her 24th birthday, she joined Le Corbusier and Pierre Jeanneret's office, to become their main furniture and interior designer. Careful to maintain her independence, she

also formed a sub group with two other avant-garde designers, René Herbst and Djo-Bourgeois.

For the next ten years she was the only woman in Le Corbusier's office and participated in most of the firm's projects, both as an architectural apprentice and an *équipement* collaborator. In association with Le Corbusier and Jeanneret, she furnished the Villa Laroche (1928); the Villa Church at Ville d'Avray (1929); the Swiss pavilion at the Cité Universitaire (1930); and the Cité Refuge of the Salvation Army (1932).

Perriand's early Modernist work was characterized by light-weight furniture made of bicycle tubes enhanced with leather seats and a wealth of highly reflective, chrome-plated and glazed surfaces evoking the glittery automobile wheels, windshields, fenders, and hoods which were taking over the metropolitan landscape. Early on, her interest in mechanical metaphors broadened to include movement and flexibility; her dining-chairs began to rotate on ball-bearings, similar to those she wore around her neck; and her tables expanded or shrank along rolling, rubber surfaces. Her contribution both to the Corbusier-Jeanneret office repertoire and to Le Corbusier's own development in interior design was considerable, and she brought to the office a distinctly new orientation.

Le Corbusier's first efforts at designing furniture were somewhat rudimentary and eclectic, but Perriand introduced an understanding of "total design" enhanced with lavish comfort and whimsical sophistication. To Le Corbusier's stiff *machine à s'asseoir*, Perriand adjoined her droll *chassis porte-coussin* to mean an armchair. Both terms referred to mechanical instruments but, while Le Corbusier equated the chair with an instrument of torture, Perriand equipped her sturdy chassis with fluffy, down-filled cushions. Their ideas interlocked and enriched each other and their working methods were complementary. Le Corbusier's role was essential in formulating the issues ("The seven states of sitting"), Perriand's in finding and developing appropriate design solutions (*Chaise longue à position variable*).

Perriand's radical, comprehensive aesthetic approach to modern interiors was complemented by Le Corbusier's programmatic concept of *équipement* as opposed to *décoration*. This functionalist approach to interior design dominated the first exhibition of the Perriand-Corbusier-Jeanneret trio at the 1929 Salon d'Automne. The exhibits, under Thonet's sponsorship, were dedicated to the *Equipment de l'habitation: des casiers, des sièges, des tables* - all characterized by standardization and modular deployment, resulting in what became known as the Corbusian concept of *objet type*. A characteristic example of such an *objet type* in Perriand's production was her 1927 rotating dining chair - erroneously attributed to Le Corbusier - that she reused over the years in different contexts.

Le Corbusier and Perriand's attitude towards the more bluntly functionalist approach of their Bauhaus counterparts was expressed in joke form at the 1931 Cologne International Exhibition. Perriand's splendid re-interpretation of Thonet's bentwood chairs, as a metallic, tubular *chaise longue à position variable*, was displayed over an outrageously fake quilt which Le Corbusier had put together, using cheap flea market carpets, named by Perriand with wry humour *tapis-manifeste*.

Perriand's final contribution to the Corbusier-Jeanneret office was her assignment as job captain for the Pavillon des

Perriand: adjustable chaise longue in tubular steel, 1927

Temps Nouveaux at the 1937 Paris International Exhibition. She resigned from the project before its completion, following a conflict due to Le Corbusier's increasing intolerance towards collaborative design. Having left the office, in collaboration with the Communist painter Fernand Léger she dedicated herself fully to her own pavilion, commissioned by the *Front Populaire* Agriculture Ministry.

Since 1936, Perriand has established a dialogue with a broad female audience through her permanent column "La ménagère et son foyer" in the journal *Vendredi*, founded by André Chamson. Paradoxically, Perriand seemed to revert to some aspects of the Ecole Centrale bias of "interior making" as a gender-conditioned activity. But she used the platform of a public journal to familiarize the *ménagère* with the Modernist ideal and to contribute more directly to shaping the taste of the public at large. Passionately involved with radical leftist groups, by 1935 Perriand joined the Association des Ecrivains et Artistes Révolutionnaires, sponsored by the Communist Party, and participated in the activities of the Maison de la Culture led by the Surrealist poet and novelist Louis Aragon. She viewed this activity as a logical extension of her role in the 1930 creation of the Union des Artistes Modernes which embraced modern industrial design and rejected traditional distinctions between applied and fine arts. In the debates preceding the 1937 Paris World Exhibition, she advocated a democratic and collectivist approach to artistic production. This involvement as well as the building of Le Corbusier's *Centrosoyuz*, took her twice to the Soviet Union

where she represented the office at meetings of the burgeoning Union of Soviet Architects, in 1934.

Informed by social commitments that transcended the immediate realm of furniture production, in 1936 Perriand presented a living room at the Third Housing Exhibition organized by *Architecture d'Aujourd'hui*, boasting a Corbusian photomontage representing *la misère de Paris*, children living in seedy streets, and speculative buildings occupying places where city officials promised green spaces and parks. Having caused an outrage within the "art décoratif" establishment, for the first time she received none of the medals regularly granted in the past for her "distinguished role in the advancement of the Arts and Industry".

Influenced by Fernand Léger, by the mid-1930s Perriand developed an interest in "art brut", where wood and natural forms increasingly replaced metal, and artisanal objects took over designs emblematic of the machine. Her new ideological position – also stemming from the growing disaffection among French intellectuals with the redemptive productivist Utopia following the Wall Street economic crash in the United States and the ensuing economic crisis in France – were reflected in important programmatic and aesthetic changes in her work.

The new vision was epitomized by a 1935 interior installation Perriand showed at the Brussels International Exposition in collaboration with Louis Sognot, Fernand Léger, René Herbst, and the two partners of the Rue de Sèvres office. A study room of an *Appartement de Jeune-Homme* lent itself appropriately to the new "brutalist" aesthetic, where sturdy

cast-metal supports and heavy slate table-tops replaced the light rubber and glittery chrome of the preceding decade. An imposing fishing net, stretched between Perriand's study room and René Herbst's *gymnazium*, mediated the massive ropes depicted on Léger's monumental plate in the background, and the rough straw of Perriand's inexpensively crafted wooden chair. The organically shaped armrests of the chair recalled the sinuous forms of Le Corbusier's painting hanging next to a huge whale vertebra. If some elements from Perriand's earliest Modernism did survive, a return to the primordial and the primitive prevailed – also resonating with Perriand's cherished memories of a childhood spent in the Burgundy countryside. Concern for weight and mass had replaced metaphors of ephemeral mechanical lightness, yet, with a zinc imprint of Le Corbusier's 1932 Vincennes housing project pasted on a modular storage case and with Léger's paintings on the walls, the installation referred back to the *synthèse des arts*, a principle Perriand had already adopted in the previous phase and would maintain throughout the post-war era.

Consistent with a new-found essentialism, Perriand explored further through photography the aesthetic potential of “accidental” forms, whether natural or industrial. Her first, 1938 *tables en forme* replaced furniture that had mechanical motion with static objects shaped to fit the movement of the human body, thus providing metaphors for her new organicism. The working desk of *Ce Soir's* editor J.R. Bloch, its form derived from the functions assigned to its various areas, and from the editor's daily interaction with his immediate collaborators, celebrated human form over the machine.

The last phase of Perriand's pre-World War II activity included work of regionalist character, as she gave a Modernist interpretation to the traditional Alpine interiors for high-altitude motels. Yet her most significant contribution occurred in 1940 in collaboration with the craftsman-architect Jean Prouvé. Together, they opened a new office in Rue Las-Cases, in association with Pierre Jeanneret, where they developed a prototype for lightweight, prefabricated multi-purpose aluminium cabins for *Alu-France*. The collaboration with Prouvé on a variety of products for mass consumption related to Perriand's reintroduction of tubular metal in her mature and last period, extending well into the post-war period.

On 8 February 1940, three months before the Nazi invasion of France, Junzo Sakakura, architect of the Japanese Pavilion at the 1937 Paris International Exhibition and previously Le Corbusier's employee, invited Perriand to assume the post formerly held by Bruno Taut, as an industrial design adviser to the Japanese government. The invitation reflected the important role Le Corbusier's office played in disseminating the ideals of the Modern Movement and the central place Perriand occupied in it by the end of the 1930s. Her efforts since 1935 to achieve a seamless symbiosis between the industrial and the artisanal, the fabricated and the natural, made Perriand the ideal figure to aid Japan's complex efforts at modernization without jeopardizing its cultural heritage. And as a woman, she appeared to be in a unique position to act effectively within the very sanctum of Japanese traditionalism – the shielded life of the home. Conversely, she found in the everyday life of the Japanese house some principles she had already applied in her work with Le Corbusier: the influence of the environment on modes of inhabitation, and liberation of interior space through

the absorption of household equipment into the walls of the dwelling. Perriand reinvented for Western needs the relationship between space and motion by adapting to modern life the Japanese view that harmonious human movement is possible only within emptiness.

Perriand spent two years criss-crossing Japan in an effort to understand its architectural tradition and searching for industries capable of adapting Western modern techniques to fit the Japanese traditional spirit. Her exhibitions for the Takashimaya department stores played a significant role and were the beginning of a series of similar exhibitions held simultaneously in France and Japan after the war.

Ultimately, Perriand's contact with Japan and its distinctive Classicism helped her purify her own “art brut” into a post-war sophistication reminiscent, in some respects, of her early Modernist phase. Her 1950 adaptation of the *chaise-longue*, where bent bamboo stems replaced the metallic tubular supports, is an example of this transformation. In general, the Japanese lesson emerged in her post-war work through the reintroduction of simple, plain wood; sliding translucent panels opening onto natural environments; low, horizontal furniture; transformable modular storage devices. Her last period was characterized by the re-emergence of some aspects of her early training. In her own words “impersonal, utilitarian and clearly industrial equipment [had to be] humanized”, with elements produced by a “renovated craft production”. An example of such interiors were her 1950 kitchens for Le Corbusier's Unité d'Habitation in Marseilles.

Perriand's post-war activity was marked on the one hand by her involvement with the pragmatic functionalism of the *Formes Utiles* movement; on the other by the elitist catering to the clientele of the Boulevard St. Germain Steph Simon Gallery. The most sophisticated furniture pieces, conceived for mass production in the 1920s, remained, not unlike William Morris, accessible only to the few. Yet Perriand succeeded in popularizing some of her significant inventions, such as the suspended toilet bowl or her standardized drawer systems. Her so-called “street interiors” of Air France lobbies around the world, encompassing the exclusive and the mass produced, remain examples of the best French design of the post-war era.

Biography

Born in Paris, 24 October 1903. Studied design under Maurice Dufrene (1876–1955) at the Ecole de l'Union Centrale des Arts Décoratifs, 1920–25; attended courses run by Dufrene at the Galeries Lafayette; also studied under André Lhôte at the Académie de la Grande Chaumière, Paris, 1924–26. Married Jacques Martin, 1943: one daughter. Worked as assistant in charge of the furniture and fittings in the studio of Le Corbusier (1887–1965) and Pierre Jeanneret (1896–1967), Paris, 1927–37; established her own studio, Place Saint-Sulpice, Paris, 1927–30, and in the Boulevard du Montparnasse, Paris, 1930–37. In private practice as an architect and designer, working with Jean Prouvé, Pierre Jeanneret, and George Blanchon on the design of pre-fabricated housing, Paris, 1937–40. Invited to Japan to serve as Industrial Design Consultant to the Japanese Ministry of Commerce and Industry, Tokyo, 1941; independent designer in Tokyo, 1940–41, and in Indochina, 1943–46. Returned to France and in private practice, Paris, since 1946; also worked in Tokyo, 1953–56, and in Rio de Janeiro and throughout

Latin America, 1962–68. Served as President of the Jury, International Competition for New Office Furniture, Paris, 1983–84; consultant to Cassina, 1980s. Member, Salon des Artistes Décorateurs, Paris, 1927; founder-member, Union des Artistes Modernes, Paris, 1930; member, Association des Écrivains et Artistes Révolutionnaires (AEAR), mid-1930s. Exhibitions include Paris, 1925, Salon des Artistes Décorateurs, 1926–28, Union des Artistes Modernes, 1930, Cologne, 1931, Brussels, 1935, and Paris, 1937. Author of several books and articles on architecture and design; editorial board member, *Architecture d'Aujourd'hui*, Paris, 1930–74. Received numerous awards and prizes including the Gold Medal, Académie d'Architecture, Paris, 1978; Chevalier, Légion d'Honneur, 1983. Major retrospective exhibition, Musée des Arts Décoratifs, Paris, 1985.

Selected Works

Examples of Perriand's furniture can be seen at the Musée des Arts Décoratifs, and the Fondation Le Corbusier, Paris.

Interiors

- 1927 Salon d'Automne, Paris ("Bar sous le toit" furnishings)
- 1928 Villa Laroche, Paris (building by Le Corbusier; furniture by Perriand)
- 1928–29 Villa Church, Ville d'Avray, Paris (building by Le Corbusier; furniture by Perriand)
- 1929 Salon d'Automne, Paris ("Équipement de l'habitation" furniture with Le Corbusier and Pierre Jeanneret)
- 1930–32 Swiss Pavilion, Cité Universitaire, Paris (furniture; architects Le Corbusier and Pierre Jeanneret)
- 1935 Exposition Internationale, Brussels (Bachelor Study, furniture and interiors, with L. Sognot, F. Leger and R. Herbst)
- 1937 Exposition Internationale, Paris (collaborated on interiors and furnishings for Ministry of Agriculture displays, bathroom, mountain refuge and modular interiors)
- 1940 Portable pre-fabricated cabins (with Jean Prouvé and Pierre Jeanneret)
- 1946–49 Hotel, Méribel-les-Allues, Savoie (interiors and furnishings)
- 1950 Unité d'Habitation, Marseille (kitchen prototype and pre-fabricated interiors)
- 1952 Maison de Tunisie, Cité Universitaire, Paris (furnishings for the student quarters; architect Jean Sebag)
- 1952–66 Air France Offices (interiors and furnishings, Brazzaville with Jean Prouvé, 1952; London with P. Bradok, 1957; Tokyo with J. Sakakura and R. Suzuki, 1959)
- 1953 Maison d'étudiant, Paris (furnishings, with Jean Prouvé and others)
- 1959–70 United Nations Conference Rooms and Assembly Hall, Geneva (consultant on modernization)
- 1959 Cité Universitaire, Paris (furnishings for the communal areas, Maison de Brésil; building by Le Corbusier and Lucio Costa)
- 1960 Mountain Chalet, Méribel-les-Allues, Savoie (building, interiors and furnishings)
- 1960 French Tourist Offices, London (furniture and interiors; building by Ernő Goldfinger)
- 1962 Apartments, Rio de Janeiro, Brazil (interiors, with Maria Elisa Costa)
- 1966 Japanese Ambassador's residence, Paris (interiors, with J. Sakakura and Riedberger)
- 1967–82 Stations des Arcs, Savoie (18,000-bed hotel facilities, buildings, interiors and furnishings; with B. Taillefer, R. Godino and others)

Perriand's furniture for Le Corbusier included *LC 1* sling chair (1928; reissued 1965), *LC 4* chaise longue (1928; reissued 1965), *LC 7* revolving armchair (1929; reissued 1978), and *Synthèse des Arts*, Tokyo chair (1955), all reproduced by Cassina. Furniture designed with Jean Prouvé was produced by Galerie Steph Simon, 1955–74.

Peruzzi, Baldassare 1481–1536

Italian architect, painter and designer

Although Baldassare (or Baldassarre) Peruzzi trained as a painter, he was also to become an architect and a designer for the stage. He was a leading exponent of early Roman Mannerism. Much of his work consisted of façade decoration, and he specialised in illusionist effects and an imaginative use

of perspective. His drawings, many of which display his experience with stage scenery, show the influence of Raphael's mature Roman style.

The son of Antonio Peruzzi of Volterra, Baldassare Tommaso Peruzzi was born in Siena and baptised there on 7 November 1481. He was the only Sienese to number among the great architects of the Italian Renaissance, and the Italian architect Sebastiano Serlio (1475–1554) who studied architecture and antiquarianism under Peruzzi, based his architectural treatise *Libri dell'Architettura* on Peruzzi's theories.

Peruzzi grew up among goldsmiths and designers and trained as a draughtsman and painter. His early work included the painting of frescoes (no longer extant) on the vaulting of the Capella di S. Giovanni in Siena Cathedral, 1501, and decorations for a small chapel at Volterra. These impressed the painter Pietro d'Andrea da Volterra who took Peruzzi to Rome in 1503 where he was influenced by Bramante (1444–1514). Bramante, like Peruzzi, was preoccupied with perspective and illusion and it is believed that the two worked together on St. Peter's. In 1502–03 Peruzzi was among painters working in fresco on the high altar chapel of the Church of S. Onofrio on the Janiculum. These frescoes show the influence of Pintoricchio and Sodoma.

Attributed to Peruzzi is a decorative framework for the vault of the Stanza d'Eliodoro in the Vatican Palace and ceiling pictures in the Stanza della Segnatura – figures of Philosophy, Apollo and Marsyas, and putti contemplating the Universe. Figured borders of the vault still survive. In 1510 two small chapels at S. Rocco were frescoed by Peruzzi, now much restored. A corridor and aviary at the palace of Julius II were painted with the months of the year in grisaille. Peruzzi's other works of the period include decorating apartments in the palace of S. Giorgio for the Bishop of Ostia, Cardinal Raffaele Riario, assisted by Cesare da Sesto. The rooms were decorated in grisaille, and included ancient Roman soldiers in battle and attacking a fortress. Peruzzi's knowledge of antiquities is evident in the detail.

For Raphael's Sienese patron, Agostino Chigi, Peruzzi designed the linear framework and chiaroscuro and some of the interior fresco decorations at the villa in Trastevere 1505–11 which was later to be known as the Farnesina after the Farnese family which took it over. Arguably his most significant work in Rome, and reflecting the Roman High Renaissance classical style, the building was simple in design, relying for interest on its decorations. Exterior decorations were painted in grisaille to imitate relief. Peruzzi's superb *trompe-l'oeil* decorations for the Sala delle Prospettive (1519) include amazingly realistic illusionary devices and false perspective, optically enhancing the size by painting a double-colonnaded loggia on three walls against an idyllic landscape background, calling on his experience as a designer of stage scenery. The loggia facing the garden was decorated with scenes of Medusa in stucco and colour. Other interior fresco decorations included Ovid's Metamorphoses in a small room, the Sala del Fregio, c.1511, and mythological illustrations of Agostino Chigi's horoscope in a large ground floor salon, the Sala di Galatea. This vaulted ceiling was illustrated with a lunette of a large head. Secular in theme, this was the largest contemporary painting of its kind in Rome outside the Vatican. The painting in the Farnesina shows a classical style and a

gradual assimilation of Raphael's influence but with more sharply defined figures.

In the same year, Peruzzi and his brother Pietro took a long lease on two houses in the Rione Ponte district of Rome. In 1515 he painted six scenes of the Betrayal of the Romans by Julia Tarpeia as temporary festival decorations created for Duke Giuliano de' Medici. Also in 1515 Peruzzi worked in Carpi in the Emilia region where he may have submitted a design for the cathedral church of S. Niccolo and the façade of the old Cathedral.

In Rome at about this time Peruzzi created frescoes for S. Maria della Pace, the Ponzetti family chapel and a Presentation of the Virgin. Following on from Raphael, in 1520 he was appointed architect of St. Peter's, with Antonio da Sangallo as his associate. Oval paintings on the vault of the loggia of the Villa Madama outside Rome probably date from this period.

In c.1521 Peruzzi moved to Bologna and prepared designs for the façade and dome of San Petronio, payments for which are dated 1522 and 1523, the rebuilding of the Palazzo Lambertini (no longer in existence) and main portal of S. Michele Bosco. While in Bologna he made a cartoon of the Adoration of the Magi in grisaille for Count Giovanni Battista Bentivoglio (now in London's National Gallery). In 1529 the tomb of Adrian VI (died September 1523), was completed to Peruzzi's design in S. Maria dell'Anima and he was also responsible for the decorative painting. Decorations were completed for the coronation in Rome of Clement VII in 1524 and designs for the doors of Siena Cathedral, for which he was paid in 1525.

During the 1527 Sack of Rome Peruzzi was captured and imprisoned by the Spaniards. Destitute, he arrived back in Siena in July 1527, where he was made architect to the Sienese Republic, responsible mainly for fortifications. He became Architect of Siena Cathedral in 1529 and decorated the organ of the church of the Carmine.

In 1528 he bought a house in the city and painted a fresco of Augustus and the Sybil in the Church of Fontegusta. In Rome for a short time, Peruzzi was made joint architect of St. Peter's before returning to Siena in 1531 where he made additions to the Villa of Belcaro, outside the city, and frescoed the loggia and chapel.

Peruzzi's major work during his last years (1533–35) was the Roman town house Palazzo Massimo alle Colonne, designed for its irregular site in an oval form with unusual curved façade decorated with dramatic chiaroscuro, and a porch with Doric columns and pilasters. In contrast with the Farnesina, this is one of the first buildings in Mannerist style.

On 6 January 1536 Peruzzi died in Rome. According to Vasari, he died a poor man because although his patrons had been wealthy, Peruzzi had been reluctant to ask for a fair reward. He was buried in the Rotonda of the Pantheon, close to the resting place of Raphael.

JACQUELINE GRIFFIN

Biography

Born in Siena; baptised 7 November 1481. First active as a painter in Siena following undocumented training, although perhaps influenced by Francesco di Giorgio Martini. Moved to Rome c.1505. Became a

member of the Compagnia di San Rocco, 1508. Met and worked with Bramante. Worked for Pope Julius II in the Vatican and for Alberto Pio of Carpi; and on Raphael's death in 1520, became associate of Antonio Sangallo the Younger for St. Peter's in Rome. Worked mainly in Rome and Bologna, 1520s, but after the Sack (1527) returned to Siena. Became official architect to the Republic. Work ranged from designs for the cathedral and monumental decorations in honour of Charles V to fortifications and engineering projects. Pope Paul III appointed him architect to St. Peter's, 1534. Died 6 January 1536. Pupils included Sebastiano Serlio and Daniele da Volterra.

Selected Works

The Uffizi in Florence holds a large collection of Peruzzi's drawings.

- 1501 Cathedral, Siena (frescoes for chapel of St. John the Baptist)
- 1504-06 Church of Sant' Onofrio, Rome (frescoes in apse)
- c.1505 Villa le Volte, Siena: Sigismondo Chigi
- 1505-11 Palazzo della Farnesina, Rome (ceiling frescoes, with Raphael): Agostino Chigi
- 1508-09 Vatican, Rome (aviary): Pope Julius II
- 1511-13 S. Giorgio, Ostia (grisaille decoration): Cardinal Raffaele Riario
- 1515 Stage set for *Calandria* by Bibbiena
- 1516 Church of Santa Maria della Pace, Rome (Ponzetti chapel): Ferdinando Ponzetti
- 1518-19 Palazzo della Farnesina, Rome (Sala delle Prospettive): Agostino Chigi
- 1521-23 San Petronio, Bologna (façade) and San Michele in Bosco, Bologna (portal)
- c.1523 Church of Santa Maria della Pace, Rome (fresco *Presentation of the Virgin*): Filippo Sergardi
- 1529-30 Decorations for Emperor Charles V's triumphal entrance, Siena: Republic of Siena
- 1531 Villa di Belcaro, Siena (additions and decoration of loggia and chapel)
- 1533-34 Castello di Belcaro, Siena
- 1533-35 Palazzo Massimo alle Colonne, Rome (building and decorations): Massimo family

Pesce, Gaetano 1939-

Italian architect, artist, filmmaker and designer

Gaetano Pesce has striven his entire professional life to challenge the status quo of architecture, interior design, and industrial design in ways that allow him to be recognized as an important figure in those fields, but still permit him to be working on the experimental fringe. Pesce can truly be seen as a contradiction in design: an artist working through the medium of industrial production. He feels that artistic influence (or at least "cultural awareness") is possible through industry, because industry "enables works to be distributed more widely than do the traditional channels of art museums, galleries, and private collections" (Vanlaethem, 1989). In this way he envisions industrial production as a means to an artistic end. His earliest success in this area was the design of the *Up* series of self-inflating seating furniture in 1969. Often seen as an example of design in the Pop Art tradition, to Pesce it represented the process of mutation and irregularity which he considers paramount to the product's artistic integrity.

Pesce transfers his artistic sensibilities to the practical problems of design by creating self-supporting, independent environments with an organic sense of space and use of materials. This is seen in his earliest interior, a polemical one, called *Habitat for Two People in an Age of Great Contaminations*, an interior environment created for the 1971 Museum of Modern Art exhibition Italy: The New Domestic Landscape. Presented in the form of a mock-archaeological look at the underground living space necessitated by the ravaging of our planet's surface by mass consumption, the habitat was a commentary on both the present state of society and its acceptance of standardized interior spaces. He focused on utility and the intelligent use of new materials, both of which formed the basis of his practical interior design work of the 1980s and 1990s.

Pesce has condemned "global design" for its encouragement of conformity and has explored contemporary design that respects the individual: "We used to think of ourselves as part of a homogenous international society. Now we can respect

Pesce: conference room, Chiat/Day Advertising Agency, New York, 1994

our differences" (Pearlman, 1989). He has extensively criticized the functionalist aesthetic of the Bauhaus as inappropriate for contemporary use, stating that "we are coming out of a period of rigidity, of traditional geometry and militaristic sophistication, and moving into a period of pluralism, openness and elasticity" (Betsky, 1993). At the same time, his theories are anti-historicist, which places him at odds with the Postmodernists, another group with which he is often identified. Convinced that "the long period of abstraction is over, and that we have to deal with images" (Frieman, 1994), Pesce uses them in a rational, unambiguous, and communicative way, always looking forward. His biographer, France Vanlaethem, further illuminated Pesce's unique linking of the vocabulary of painting and sculpture with design when he stated that "His means are the image rather than the ornament, the material rather than the form or the style" (Vanlaethem, 1989).

Perhaps the most cohesive example of Pesce's design and production theories is his interior for Chiat / Day Advertising Agency in Manhattan (1994). The agency's owner wanted what he termed a "virtual" agency, with no dedicated work spaces, i.e., spaces were shared, not owned, and office supplies such as laptop computers and cellular phones, checked out for a day's use, promote a flexible and efficient working style that can be viewed as a glimpse of the future of the office as it is now known.

As with many of his floor or landscape plans, Pesce began with the human body as the basis of his design, which, like the body, is irregular; the entire office floor, seen in overhead view, centers around a human face; this image is brought to a personal level on the wooden lockers where workers store their belongings, whose doors are faces in profile. Pesce created a city-like environment around his framework with spaces that are multi-purpose, likening the office to a medieval town or a college campus. These spaces include a clubhouse, modeled on a student union, an open meeting area, or "piazza," and other non-dedicated spaces resemble college libraries or computer labs. His rational imagery is carried to a humorous level with the design of the conference room, where informal brainstorming sessions are held – the exterior walls of the space are covered with goose-neck lights.

Pesce experimented with materials in the Chiat / Day project, using a pigmented liquid resin for the floor – its hardening time allowed him to be able to integrate other imagery through means of casting into the surface. In this way Pesce preserved the irregularity of the artistic image with industrial production methods. These castings are representations of past campaigns in the shape of liquor bottles and soda cans; the project rooms are indicated by numbered light bulbs also cast into the resin floor. The furnishings are made of resin and metal, and the interior walls are constructed of multicolored "bricks" cast from television remote controls. The overall

effect of the office design, with its color and openness of plan, is one that promotes feelings of vitality and stimulation, the feeling of being part of an experimental process – perfectly appropriate for an advertising agency.

In a design for one of several bars in a Japanese hotel, Pesce again developed a plan comprising imagery and irregularity. The bar was part of a collaborative project between Japanese and Italian architects for the interior design of the building, called *Il Palazzo* (1990); the name reflects the multi-cultural designers involved (Pesce, fellow Italian firm Sottsass Associati, Japanese designers Shiro Kuramata and Shigeru Uchida), and the owners' wish to have a strong architectural presence in the riverfront area Fukuoka, the town in which the hotel is located.

Pesce titled his bar *El Liston*, meaning "a stroll" in the Venetian dialect, and the design reflects this most literally. Pesce created a multi-leveled space which, seen in two-dimensional plan, forms an image of a person holding a cocktail glass. Secluded seating is available on three screened-off levels accessible by a set of ascending steps, though one can descend along the opposite side of the bar by means of a crossover bridge. A trip through the space is truly like a meandering walk through Venice with its bridges and wandering streets. This connection is reinforced through Pesce's use of vibrant-colored and varied materials such as polychromed urethane, resins, rubber and colored stucco alongside wood, glass, sheet metal, and papier-mâché. Pesce brought these together to achieve a dense, overlapping visual space. He also used one of his most recent chair designs, the *Feltri*, often seen as his most successful exploration of the potential of non-uniform production methods; the chair can be made inexpensively by a semi-industrial method which brings irregularity into play, likening it to craft.

With objects like his 1988 *Table Made with Music*, featured in the 1995 exhibition *Mutant Materials in Contemporary Design* at the Museum of Modern Art – vibrations of sound form a design in the hardening resin of the tabletop – Pesce continues to redefine object and interior design through his exploration of non-standardized production techniques and contemporary materials. This personalization and experimentation is reinforced by his belief that "the artist of our time is the industrial designer ... When I am able to say something about myself, my political opinions, my cultural moment, then I've added philosophical meaning to an object. At that moment, the object becomes what the canvas is to the painter: a way to reveal himself. At that moment the product is not only industrial design, it is also a piece of art" (Pearlman, 1989).

JENNIFER A. KOMAR

Biography

Born in La Spezia, 8 November 1939. Studied architecture, University of Venice, 1959–65; Institute of Industrial Design, Venice, 1961–65. Married Francesca Lucco, 1969; 2 children. Active as an independent artist and filmmaker, and founder-member Gruppo N art group, Padua, 1959–67. Freelance designer of interiors, furniture and textiles, Padua, 1962–67, and Venice, from 1968. Resident in the United States from the late 1970s with an office in New York and a studio in Paris. Clients included Cassina, Bracciodiferro, Bernini, C & B Italia, Expansion, Knoll, Parisoot, Venini, Vittel and others. Professor of architectural planning, University of Strasbourg, France,

from 1975; visiting professor and lecturer: Ohio State University, Columbus, 1974; Cooper Union, New York, various dates between 1975 and 1986; Pratt Institute, New York, 1979, 1980, and 1984; Ecoles des Beaux-Arts, Nancy, 1981; University of Technology, Compiègne, 1981; Yale University, New Haven, Connecticut, 1983; Universities of Quebec and Montreal, 1984; Polytechnic of Hong Kong, 1985; Domus Academy, Milan, 1986 and 1987; and University of São Paulo, 1987. Author of many articles on architecture and design; exhibited at numerous national and international exhibitions. Awards include the Locarno Film Festival award, 1968, Parc de la Villette Award, Paris, 1982, and Office Furniture Competition Award, Paris, 1983.

Selected Works

Examples of Pesce's design work and furnishings are in many international collections including the Metropolitan Museum of Art and the Museum of Modern Art, New York, the Centre Georges Pompidou, and the Musée des Arts Décoratifs, Paris, and the Museo d'Arte Moderna, Turin.

Interiors and furnishings

- 1969 *Up* self-inflating chairs: B & B Italia
- 1971 Italy: The New Domestic Landscape exhibition, Museum of Modern Art, New York (interior and furnishings known as *Underground City and a Habitat for Two People in An Age of Great Contaminations*)
- 1972–74 *Golgotha* series of tables and chairs: Bracciodiferro
- 1972–78 *Carenza* bookcase
- 1975 *Sit-Down* upholstered seating: Cassina
- 1977–78 Project for the Phalavi National Library, Tehran
- 1980 *Dalila* polyurethane chairs: Cassina
- 1980–83 *Manhattan Sunrise* upholstered sofa: Cassina
- 1980–85 *Sansone* tables: Cassina
- 1980–85 *Les Ateliers* sideboard / cupboards: Cassina
- 1985–86 Apartment, Avenue Foch, Paris (interiors and furniture): Marc-André Hubin
- 1986 *Feltri* armchairs: Cassina
- 1986–88 *Unequal Suite* tables and armchairs: Cassina
- 1990 *Il Palazzo* Hotel, Fukuoka, Japan (*El Liston* bar interiors and furnishings)
- 1994 Chiat / Day Advertising Agency, New York (interiors and furnishings)

Pesce's designs for textiles date from the late 1960s and include the *Carlotta* fabric (1967) and the *People* fabric (1987) for Cassina. His lighting designs include the *Moloch* lamp (1970) for Bracciodiferro. Versions of the *Vittel* bottle were produced between 1986 and 1989.

Philadelphia 1876

Centennial Exhibition

The Philadelphia Centennial Exhibition of 1876, although it was conceived in 1864 before the end of the American Civil War, soon became the vehicle for America to present itself as a reunited country to the international community in terms of its "Arts, Manufactures and Products of the Soil and Mine". With almost 250 buildings sited on more than 280 acres of park land, its 31,000 exhibitors presented an encyclopedic survey of American and International culture to 10 million visitors over the course of six months with an extraordinarily broad range of displays even by 19th-century standards. With so many novel exhibits, the fair had a visual, aesthetic and even emotional impact on American consumers.

An extensive array of novel industrial technology in Machinery Hall, highlighted by the towering Corliss Steam engine and mechanical refrigeration, heralded the progressive nature of the fair's content. Such large-scale displays were complemented by the myriad consumer objects or "Manufactures", housed in the prime exhibition space of the main building. Covering some 20 acres, its cases and kiosks must have seemed the equivalent of a catalogue of domestic wares or a precursor to our modern shopping malls. Here were shown ceramics, glassware, silver, textiles, paper patterns and clocks as well as a major display of furniture, ranging from functionally utilitarian to decoratively historical in style. Nationally recognized firms such as the Thonet Brothers, Haviland and Doulton ceramics, Gorham and Reed & Barton silver and Tiffany exhibited beside lesser known local and regional wares in the pavilions of the states and foreign nations. First and foremost, this was a fair about industrial success, and the domestic goods on display emphasized the commercial success of their makers.

Although the display and sales of domestic wares and the networking of the businesses who made them were the most obvious ways in which the Centennial Fair influenced the interior design taste of a generation, it also produced and reflected

subtler influences on American culture. Some of its content was conservative, like the factory-made, ornately carved designs which dominated the furniture displays in Philadelphia. Combining these domestic products with the eclectic mixture of exotic wares ranging from Indian carved furniture and Japanese bronzes or porcelain to French stained glass, the fair introduced a domestic mélange of goods that would characterize the way in which Americans would decorate their households through the end of the century. But other, more progressive trends, both aesthetic and social, were also in evidence at the Fair: harbingers of an American neo-Colonial style, open-space interior planning and the changes in social customs that would affect how rooms were designed and furnished were all part of the fair's content. These are the influences that would be reiterated by decades of designers into the 20th century.

Pavilions from the New England states emphasized America's colonial heritage, reproducing a late 18th century homestead, with guides in colonial costumes, recreating a rustic New England cabin or even presenting Pilgrim artifacts such as John Alden's desk and a Mayflower cradle. The Centennial experience also became one of the most prominent incentives in the 1870s for architects and designers to begin investigating and replicating American 17th- and 18th-century material culture, a movement that would culminate in the initiation of preservation efforts for buildings and their interiors by the 1920s.

Less than two decades after Japan's opening to the West, the exhibition also acquainted Americans first hand with oriental materials – particularly through a life-sized Japanese dwelling and bazaar, both built by Japanese craftsmen brought to Philadelphia specifically for their construction. This experience and others like it began to inform the spatial layout and decorative detailing of architects like McKim Mead and White or Bruce Price in their shingle-styled buildings of the 1880s where exotic flourishes of woven mat work ceilings, ornate screens and even faux-bamboo columns become popular. At least one specifically educational endeavor at the Fair, the working Froebel Kindergarten, was credited, years later, by Frank Lloyd Wright as having been a formative influence. The Kindergarten had so impressed his mother that she returned home from her Centennial visit with a set of Froebel "gifts" – a system of blocks and colored shapes intended to develop a child's spatial imagination – that some see as the basis for Wright's design sense. While Froebel's theories already had a following in the United States, they reached a much larger audience through the Philadelphia Fair.

Perhaps the most progressive experience on the fairgrounds was found in the Women's Pavilion which highlighted women's activities and accomplishments, including their increasing involvement in America's work force and their new patterns of domestic life at home. Novel machinery for washing clothes, sewing and knitting and other modern conveniences including toasters and dish washers were demonstrated, and new hygienic areas for the systematic preparation of food and other domestic services were promoted. The social impact of such devices, when combined with other exhibits in which women ran heavy machinery or owned their own companies, meant that one of the strongest social messages of the Fair was that the role of a woman was changing toward a new, 20th-century

hybrid who while still responsible for organizing household labor, had less time to devote to it exclusively. This attitude becomes what Dolores Hayden later refers to as a “grand domestic revolution” that has in turn affected the plan and furnishing of residential structures to the present day.

This mixture of visual images and social influences suggest that the Centennial was in effect a 19th-century version of mass media, disseminating new ideas, reflecting current attitudes and advertising commercial products to a broad number of Americans that in turn changed the way they thought about many aspects of their lives, including the built environment.

Phyfe, Duncan 1768–1854

American cabinet-maker

A practical man of business as much as a designer, Duncan Phyfe was able to keep abreast of changing taste in America, while maintaining a very high standard of craftsmanship and quality. Beginning as a sensitive but orthodox follower of the Chippendale style, he soon became one of the most important interpreters of Hepplewhite and Sheraton, helping to recast their work as the American Federal Style. He later adopted a French-influenced Directoire mode, and spent a large part of his career producing work in the Empire style. By the time he retired in 1847, both his custom and export pieces were in the Gothic and other revival styles then in fashion. Phyfe's reputation was sufficient to garner such prestigious patrons as members of the Astor family of New York and the Du Ponts of Delaware, with clients in the major cities and throughout the Middle Atlantic states. He also had substantial dealings with clients in Southern cities, using an agent in Savannah, Georgia, in the 1810s and 1820s, and sold widely through the West Indies. Though shifting tastes have given prominence to different periods of his changing styles, Phyfe's furniture has been highly valued by every generation since his death.

Born near Loch Fannich, Scotland, in 1768, Phyfe emigrated with his family to the United States in 1784. After settling in Albany, New York, he began his career as a conventionally trained joiner, with access to the widely available books of English furniture design and the popular London price books. He became successful as a cabinet-maker soon after his move from Albany to New York City. By the time he was thirty years old, he had a number of apprentices, and soon had at least two of his sons and other relatives working for him as well. He owned and used several adjoining buildings for his growing business, and soon became a landlord, renting out neighborhood properties both as homes and the offices of tradesmen and to others in furniture related ventures. Hardly unique in combining astute business sense with an excellent sense of design, Phyfe seems to have had a network of relatives in all the areas of supply necessary for a furniture maker: lumber, varnishes, turpentine, upholstery, hardware, etc. This not only assured him of having the best materials available when needed, but helped him to price favorably those secondary products that he produced for an export market. He was so successful that his name appeared in a book listing the wealthiest New Yorkers just two years before he retired, with a net worth – exclusive of real estate – of \$300,000, and he was described as having the largest such business in the United States.

As his young adopted country was striving to develop an identity of its own and its growing wealthier class was torn between emulation of the best of the mother country and a desire to lead the country in a new direction, Phyfe was one of those who struck a sympathetic note by adapting the classical period designs of George Hepplewhite and Thomas Sheraton to what was to become known as the Federal Style. The use of the lyre shape, found in the work of Robert Adam and his English successors, became the dominant form in Phyfe's major period. The form was used as the splat of side chairs, as the base of tables; as support and, secondarily, as a decorative

Phyfe: reconstruction of interior, early 19th century

element. His primary decorative device, during his period of greatest importance, was the use of the acanthus leaf; it derived from 18th-century English models, but was simplified and more lyrical. Other elements were the drapery swag – usually with tassels – the classical fluted column, bowknot, reeding, and the cornucopia. In the best examples, these elements are carved with great sensitivity, and such pieces are highly prized. Though all were widely used among his peers, it is the combination of Phyfe's delicacy, simplicity, and gracious proportions that singled him out for both contemporary success and an enduring reputation. As only his export pieces were labelled, and the best of his custom work was unsigned, connoisseurship and provenance are the twin factors in attributing furniture to Phyfe and his workshop.

The influence of Phyfe was so strong, by the middle of the first quarter of the 19th century, that specific forms of furniture, the Phyfe sideboard and the Phyfe card table were so referred to by competitors, patrons, and the critics alike. Later, as his work began to increasingly reflect French forms and design, his name became identified with certain forms and patterns that he had adapted for both his custom and export

pieces. Among his New York contemporaries, only the Frenchman Charles-Honoré Lannuier had a similar reputation for a period. Phyfe adopted and adapted European styles for his American audience, and his work of the period from about 1830 until the end of his career became increasingly heavy in mass and appearance, following French fashion, with rosewood and dark mahogany woods; sofas now became the form of furniture in greatest demand. In the pieces of his last few years, gilding and veneers became new elements in his furniture, and though he was still extremely successful, it is the early, more delicate, works that have caused his reputation to endure through the 20th century.

DAVID M. SOKOL

Biography

Born Duncan Fife, in Loch Fannich, Scotland, 1768. Emigrated with his widowed mother and siblings to America, 1784. Family settled in Albany, New York, where Phyfe served his apprenticeship. Moved to New York City; listed as in business as a cabinet-maker, 1792. Married Rachel Lowzada, 1793 (died 1851); 7 children. Business occupied workshops, showrooms, and warehouse by 1830s; listed as

Duncan Phyfe and Sons, 1837–39, and Duncan Phyfe and Son, 1840–47. Died in New York, 1854.

Selected Works

Important collections of Phyfe's furniture are in the Edison Institute, Dearborn, Michigan; the Metropolitan Museum of Art, New York; the Museum of the City of New York; and the Taft Museum, Cincinnati.

Picture Frames and Picture Hanging

Collectors of art have always sought to display their collections, however humble, either in public rooms or more private spaces depending on the scale and the nature of the work. Easel paintings, prints and drawings have customarily been framed by collectors for the purposes of such display, the frame acting as a protective casing for the edges of the picture and enhancing the pleasure of ownership.

In the history of interior decoration, the framing and hanging of pictures evolved as an integral aspect of the proportions and the architecture of an interior and also as an expression of the cultural aspirations of collectors. A great deal of importance was therefore placed on the design of the frame itself. In 16th-century Italy, the relationship of the framed image to other framed objects or features in a room and their collective arrangement in relation to the proportion and function of the room was considered crucial. Ironically in this context, the quality of the framed image was often of secondary importance to the decorative potential of the frame itself. In some instances frames were commissioned before the

canvases had even been painted; for example, Giacomo del Marino was commissioned to carve the frame for Leonardo da Vinci's *Madonna of the Rocks*, before Leonardo had begun the painting.

Elsewhere in Europe, the more formal hanging of pictures based on the Italian example evolved in the 17th century as a symptom of the international popularity of High Renaissance classicism in architecture. Prior to this, most collectors hung their paintings in highly individual ways, depending on the quantity and quality of their collections. Some collectors chose the crowded approach; David Teniers's painting of Archduke Leopold of Austria's picture gallery (1647) illustrates a collection that almost entirely covers the walls from floor to ceiling, with the largest paintings hung high and canted forward so that they could be more easily viewed. The density of the hang indicated the prodigality of the collector, the quality of the works themselves his taste and wealth. The Dutch middle classes exhibited a similarly uninhibited approach to picture hanging, hanging their paintings in every conceivable manner, wherever there was space.

As private collections grew in size and number, conventions slowly evolved as to the hanging of paintings. Paintings were chosen or commissioned for specific rooms, dictated by the room's function, betraying an increasingly ordered, formal approach to the decorated interior in which each element had its purpose and its place. Sir Henry Wootton expounded on a themed approach to the hanging of paintings according to subject matter as early as 1624, asserting that "cheerful" paintings were required for "Feasting" and "Banqueting Rooms", "Graver Stories" for galleries, "Landscapes and Boscage" for summer houses and terraces. The acquisition and organisation of paintings of appropriate subjects was often considered more important than the quality of the work itself, on the basis that a mediocre image could be improved with an excellent frame.

The relationship between framed paintings and their settings was not clearly defined in England until after the Restoration of the monarchy in the latter half of the 17th century. Following the Restoration, paintings were hung above doors and fireplaces to create a vertical emphasis and were canted forward for better visibility. Paintings were also variously hung from the wall or entablature on tasselled cords, chains or wires attached to rings or hooks behind the frame. Cord bows terminating in tassels were sometimes used as a decorative feature to disguise hooks on the wall, and while it is difficult to gauge the precise popularity of this technique, evidence suggests it was not unusual. King William III had his painting collection hung from cords so that he could rearrange his paintings at will. Lady Louisa Conolly used a decorative combination of purple and silver cords and tassels against white damask walls for a picture hang at Castletown in the 1760s, a method of hanging that she repeated in the Print Room devised c.1773. Picture frames were principally derived from Dutch, French or Roman examples, the most fashionable being derived from French-style frames.

By the early 18th century, art collectors who were motivated by travel abroad and a thriving international painting trade, led to a greater discrimination in the choosing of new pieces. The number of paintings acquired by members of the British aristocracy increased and the quality of image collected improved. The best and largest paintings in a collection were

Picture Frames: drawing for cabinet, Felbrigg Hall, Norfolk, showing proposed hanging of pictures c.1750

usually hung in the more public rooms of a house and the gallery. Smaller precious works were displayed in adjacent cabinets or closets. Picture frames were heavy and ornate, designed to draw attention to the works but also to represent a decorative feature in their own right. Not all paintings hung on the walls were originals. Old Master paintings, although preferred, were extremely expensive and were in short supply. Collectors were therefore left with three options: to commission a copy of a prestigious painting, to commission a portrait, or to employ a decorative painter to produce a series of mediocre paintings. Such were the cultural aspirations of the serious 18th-century collector, that copies were a fairly common occurrence in collections of note.

Some 18th-century galleries were swamped by the picture collections they housed. At Corsham (1762) the paintings were organised in such a way as to fill the whole wall space between entablature and dado. The dimensions and subject matter were carefully juxtaposed to create a balanced whole to complement the architectural proportions of the room. The architectural ornament, subsidiary objects and furniture also formed part of

the decorative scheme. Balance in a picture hang was created through symmetry, influenced by European picture hanging conventions. In order properly to plan the position of paintings on walls, small cards, of the appropriate shapes and scaled-down dimensions, were used to represent each picture and were labelled accordingly. These cards were arranged on a scale drawing of the wall space, onto which the "ideal" positions of the paintings were transcribed, with particular attention given to the vertical and horizontal spacing between paintings. The ideal arrangement tended to place the larger paintings high on the wall and the smaller ones lower down for greater visibility. Paintings were usually hung in several symmetrical tiers to the left and right of a central arrangement consisting of larger paintings, these often being the better works in the collection and thus deserving of a central position on the wall. Because of their obsession with symmetry, it was not unknown for collectors to butcher lesser paintings by cutting them down into smaller units. These details or fragments were then reframed as pendants to the exact size required to maintain the symmetry of the hang.

By the 19th century, the order and density characteristic of 18th-century picture hangs was gradually replaced by a more relaxed and personal approach to display. The arrangement of paintings was still symmetrically determined but paintings were not so closely packed nor were they as rigidly aligned. Some collectors divided up their paintings according to subject matter, some according to school, while others preferred single paintings to dominate whole walls. Many were also no longer as concerned about matching picture frames. Frames themselves became available in increasingly diverse styles due to the aesthetic eclecticism of the age. The framing of paintings for domestic interiors owed more to personal preference and contemporary fashions than to aesthetic conventions – a situation that persists to the present day.

Pietre Dure

Pietre dure (*pietra dura* in the singular) are literally hard or semi-precious stones that are worked with versions of lapidary techniques and are used in creating decorative objects as well as being a decoration for furniture and interiors. The working methods have been known, in Italy particularly, since classical times, especially for small items and jewellery. In the Renaissance the processes were revived for use in the decoration of furniture and later for other *objets d'art* and even interiors.

The revival seems to have occurred in Milan, and it was from here that Cosimo I de' Medici poached craftsmen to help him establish a workshop in Florence. A workshop was duly founded in 1588 under his auspices, which later became known as the Opificio delle *Pietre dure*. Other centres developed; Rome was one and Venice another, and in Naples the Royal *Pietre dure* factory was founded by the King of Naples in 1737. Using Florentine artisans it quickly established itself and it is now difficult to distinguish its early work from the Florentine versions. It eventually closed in 1860.

The techniques can be divided into two varieties. The first is a glyptic process in which vases, bowls and the like were cut from semi-precious stones and mounted in fantastic gold or enamelled mounts. The other version, which uses laminae of stones, was used in mosaic for cabinets or table tops and in some cases whole interiors. This is known as *commesso di pietre dure*, or Florentine Mosaic. It is a process in which decorative panels are made up from a mosaic of irregular-shaped semi-precious stones, for example, chalcedony, agate jasper or lapis lazuli. This "jigsaw" is glued to a slate base for stability: in this it is similar to marquetry in wood. If coloured stones are inlaid into a marble base they are strictly an intarsia process.

The embellishment of cabinets and table tops was one of the chief uses for *pietre dure*, although its use in interiors was also known. The Medici tomb – Cappella dei Principi – in S. Lorenzo, Florence which was begun in 1604, is a fine example of this extravagant decoration.

Although the most prestigious work was carried out in Italy, the taste for *pietre dure* spread across Europe. For example, the Miseroni family from Milan worked for Rudolf II in Prague, as did the Florentine Cosimo Castrucci who devised a pictorial landscape approach to the work. In Paris, from 1660, the royal manufactures at Gobelins were supplemented by Domenico Cucci who brought the techniques of *pietre dure* to France. Later French *ébénistes* under Louis XVI, including Carlin and Weisweiler, favoured the re-use of *pietre dure* taken from cabinets from this period for use in their "modern" cabinets. In 1759, the Buen Retiro workshop was established in Madrid by Charles III, using Italian craftsmen and management. Active

from 1763 to 1808, it was well known especially for the production of table tops, some of which are still in the Prado.

One of the evident uses for the magnificent furniture made with these processes was as valuable gifts from one ruling family to another. The Grand Duke sent a *pietre dure* table to Queen Elizabeth at the end of the 16th century, while the magnificent Elector Palatine cabinet, designed by Foggini, was made as a gift to Cosimo II's daughter, the Electress.

It was not always the very powerful or wealthy that were able to enjoy *pietre dure* work. The economic potential of the visitors on the Grand Tour was not lost on the Florentines. Many gentlemen were to bring back panels for making up into cabinets in their own country, and some commissioned fully finished furniture to be delivered to them at their homes.

One of the first to do this was John Evelyn who, having visited Italy, commented on the "divers incomparable tables of pietra commessa, which is a marble ground inlaid with several sorts of marbles and stones of divers colours, in the shape of flowers, trees, beasts, birds and landships like the natural". His love of the material resulted in the purchase of panels made by Domenico Benotti in 1645 which he had mounted into a cabinet upon his return to England.

Later examples of this English taste for *pietre dure* must include the outstanding Badminton cabinet which was made in Florence for the 3rd Duke of Beaufort in 1726, and shipped to England complete with assembly instructions. Another famous piece, the Kimbolton cabinet, designed by Robert Adam for the Duchess of Manchester, was used to provide a setting for *pietre dure* panels that had been brought back to England from the Grand Tour.

The style of the Florentine *pietre dure* work often relied upon well-established designs, so it is difficult to date the work or attribute a particular workman. The design of the cabinet and its mounts are more likely to help in this regard. The Roman work tended towards a geometrical design with less colour, as did the Venetian models.

Though crucial to the technique, the artisans had no involvement in the design of the panels. This was the province of artists especially employed to produce full-scale paintings which were to be the basis of the designs. These designs were then again traced and applied to the stones ready for cutting. One such artist was Jacopo Ligozzi (1545–1626). He and Bernardino Poccetti were responsible for the magnificent table top for Ferdinando II Medici made as a *pièce de résistance* between 1633 and 1649 (now in the Opificio Museum). Ligozzi was a dominant personality in the Florentine atelier. Under his influence formal designs such as geometric grids were dropped in favour of naturalistic designs with clear bright colours fabricated from the appropriate stones.

The expensive luxury of *pietre dure* meant that some imitations would inevitably be pressed into service. *Pietre paesina*, a cheaper stone which offered elaborate figuring, was used in combination with painted grounds, and the development of *scagliola* meant that the exoticism of *pietre dure* came to be devalued.

During the 19th century large quantities of ready-prepared stones exported from Italy were often mounted onto furniture. French makers were particularly fond of the method, but there are many English examples to be found also. They were usually mounted on side cabinets and were either glued onto the

surface or let into a veneer which was usually ebony or ebonised. They were commonly used in side cabinets and table tops, but were sometimes mounted in frames and used to decorate walls as pictures. Although the Italians remained pre-eminent in the craft, the taste for hard-stone decorated furniture was such that many local materials were pressed into service, for example, Ashburton marbles, along with the development of a range of inventions to imitate the effects.

Pillement, Jean 1728–1808

French painter, decorator and *ornemaniste*

One of the most widely travelled of all French 18th-century artists, Jean Pillement had an enormous influence on the development and spread of French Rococo Chinoiserie throughout Europe. He held important court positions both in France and abroad, and produced innumerable suites of drawings and

engravings which were translated and transferred onto decorative objects of every sort. His whimsical, ethereal designs piqued the fantasies of Europeans already indoctrinated into the aesthetic license and merriment of the Rococo spirit. He appealed to an almost unquenchable thirst for decorations in an exotic taste, so much so that, while his first substantial output did not occur until the mid 1750s, he continued to publish ornamental designs for several decades, long into the reign of Neo-Classicism.

Born in Lyon in 1728, the son of an ornament and textile designer, Pillement migrated to Paris to finish his formal studies under the painter, Daniel Sarrabat (1666–1748). He worked early in his career at the Gobelins tapestry factory, but by 1745 had begun voyaging further, alighting in Spain and Portugal before settling in London in 1750. There he contributed to Robert Sayer's *The Ladies' Amusement* (2nd edition, 1762), a compendium of decorative motifs in the Chinoiserie taste; published several other solo collections of designs inspired by the Orient; and even exhibited paintings at the London Society of Artists in 1760 and 1761 (and at the Free Society of Artists during subsequent visits). He then returned to Paris for a brief stay before travelling to Turin, Milan, Rome, Vienna, Warsaw, Bonn, Avignon, and Portugal, with occasional stops in Paris and London.

This peripatetic nature partly explains the presence of Pillement or Pillementesque interior decoration in most of the capitals of Europe, but just as crucial to the dissemination of the artist's works was the universal appeal of his lighthearted and gay compositions. His designs were extremely fanciful, and he often abandoned traditional notions of scale and propriety, juxtaposing imaginative or nonsensical architectural structures with giant flowers, exotic beasts, and buoyant oriental figures engaged in leisurely activities. He was an excellent draughtsman, with far-ranging creativity and a unique style, and derived inspiration not only from products imported from the Far East, but more significantly from earlier Rococo and Chinoiserie artists, in particular Antoine Watteau (1684–1721). From Watteau, whose "solemn priests and pagodas, obsequious courtiers and devout worshippers, parasol canopies suspended in mid-air, mandarin-headed terms, and temples open to the sky ... [became] the essential ingredients of chinoiserie" (Honour, 1961), Pillement inherited a sense of elegant fantasy, as well as a basic vocabulary of compositional elements.

Although Pillement adopted this repertoire of motifs, the distinction in his designs remains in their qualities of delicacy and tenuousness, the images dream-like in their transitory nature and implausibility. His designs are playful in their interpretation of the natural world, too. His flowers, for instance, are mostly imaginary (bearing a strong resemblance to the creations of the 20th-century children's writer, Dr. Seuss), and he called them variably *fleurs de fantaisie*, *fleurs de goût*, *fleurs dans le goût chinois*, and *fleurs persanes*. They, and his style generally, became so recognizable that whatever resembled them became known as *à la Pillement*. Also, it is worth remarking that there was scarcely any compulsion or ability to differentiate between cultural artifacts and images arriving from China, Persia, India, Japan, or other Near and Far Eastern places. They were all exotic to Europeans, and hence fascinating and fashionable.

Pillement's early compositions, particularly those intended as wall decoration, have a two-dimensional structure which appears to be derived from the arabesques of earlier designers such as Jean Berain (1640–1711) and Claude III Audran (1658–1734). Figures are stacked upon each other or staged on a loose scaffold of swirling leaves, C-scrolls, trellises, and *rocaille*. Later compositions demonstrate an attempt at oriental perspective in the diagonal recession from the bottom to the top of figures, paths, and other visual devices. Yet in both cases his designs were conceived in two dimensions and meant almost exclusively for surface decoration.

Perhaps the most astonishing facet of his work, besides its far-reaching dissemination, was its easy translation into almost all media. Pillement declared his engravings suitable "à l'usage des dessinateurs et des peintres," but in fact they received much wider application. Cabinet-makers in France and abroad copied his images for marquetry and for painting on furniture, and J.B. Réveillon printed a number of wallpapers based on his designs. In England, where his ornaments were particularly popular, they were adopted by enamellers at Battersea and by transfer-printers at Liverpool and decorators at Worcester, including James Giles. And Pillement was commissioned to supply designs for Lyon silk weavers and painters; for Jean-Baptiste André Gautier Dagoty's textile printing factory in Paris; for Oberkampf's *toiles de Jouy*; and even possibly cartoons for Aubusson tapestries.

Among Pillement's most important interior commissions are those for Catherine the Great at Oranienbaum; for Marques de Marialva at Cintra, Portugal; and for King Stanislas Augustus Poniatowski of Poland, who later appointed him *pictor regiu* (royal painter). He was also appointed court painter by Marie-Antoinette, having provided her with several paintings for the Petit Trianon. As many Chinoiserie constructs took the form of architecture and decoration for tea houses, garden pavilions, and other ephemera, they have not survived the vagaries of fashion nor the ravages of time. The few extant interiors by Pillement and his oeuvre of drawings, paintings, and engravings must serve to communicate how very extensively his concepts of Rococo fantasy were adopted.

MARGARET W. LICHTER

See also Chinoiserie

Biography

Born in Lyon, 24 May 1728, the son of a designer of ornament. Studied under the painter Daniel Sarrabat (1666–1748). Married Marie Julien, 1687. Worked as a designer in the Gobelins tapestry factory, Paris. Went to Spain, c.1745; lived in Madrid for three years, and for a short period in Lisbon. Active as a painter and designer in London, 1750–c.62. Returned to Paris and then visited Turin, Rome and Milan; worked in the Kaiserhof, Vienna, 1763. Summoned to Warsaw by King Stanislas Augustus of Poland, 1766; appointed royal painter, 1767. Moved to Bonn, 1767, and to Avignon, 1768. Travelled between London and Paris throughout the 1770s. Appointed court painter to Marie Antoinette, 1778; supplied designs for textiles to Jean-Baptiste André Gautier Dagoty (1740–86), 1779. Active in Portugal, 1780. Settled in Pézenac, 1796; returned to Lyon to teach drawing in the early 1800s. Published numerous prints of ornament and designs for Chinoiserie figures and flowers, c.1755–74. Exhibited landscapes and drawings at the Society of Artists, London, 1760 and 1761; exhibited paintings in London and Paris during the 1770s. Died in Lyon, 26 April 1808.

Selected Works

An album of 36 drawings and an important collection of decorative paintings and designs is in the Musées des Tissus, Lyon. Additional works are in the Musée des Arts Décoratifs, Paris, and in public and private collections in Florence, Lisbon, Madrid and New York.

Interiors

- c.1750 Château de Craôn, Haroué (decoration of the Salon Pillement)
- 1762–68 Oranienbaum, Russia (decoration of the Glass Bead Room)
- 1763–69 Kina, Dröttningholm (designs after Pillement and Watteau in the Green Salon)
- c.1766 Royal Palace, Warsaw (decoration of the Study)
- 1772 Adelphi, London (decoration of the drawing room)
- mid-1780s La Cintra (San Pedro), Portugal (Garden Pavilion)

Pillement provided textile designs for Jean-Baptiste André Dagoty, Oberkampf and various Lyon silk weavers. His designs were also adapted for marquetry by Januarius Zick, and for painting on furniture, tiles, enamels and porcelain.

Pineau, Nicolas 1684–1754

French architect, sculptor and designer of interiors

Nicolas Pineau was one of the most innovative and influential French interior designers of the Rococo period. He was even credited with inventing the Rococo (*Rocaille*) style by his contemporary Jacques-François Blondel, an important architect and theoretician. Blondel himself published some of Pineau's designs in *De la Distribution des Maisons de Plaisance et de la Décoration des édifices en général* (1737). Other examples of Pineau's imaginative approach to interior design were published by Mariette in *L'Architecture française* (1727), and *L'Architecture à la mode* (1738), a new edition of D'Aviler's *Cours d'architecture*. Through these popular publications, Pineau's designs were widely circulated. They gained for him a name and acclaim seldom experienced by interior designers (*dessinateurs*) before this time. Even though Pineau was not actually the inventor of the Rococo (called *genre pittoresque* or *style moderne* during this period), as Fiske Kimball has so clearly shown, he infused the style with vitality, freedom and a three-dimensional complexity not seen before (Kimball, 1943).

Pineau adopted the trade of his father Jean-Baptiste Pineau (1652–94), a sculptor and interior designer at the court of Louis XIV. Nicolas did not have the opportunity to train under his father, however, since Jean-Baptiste died when his son was ten. Instead he studied under Jules Hardouin-Mansart, the first Architect to Louis XIV, and later worked with his successor Robert de Cotte, who employed Pineau to help renovate the Hôtel de Ville at Lyon. Little else is known of him before he left for Russia to work for Peter the Great. It is possible that he helped with the interior design of the Hôtel de Vendôme in Paris executed by Alexandre Le Blond, since Le Blond chose him to join his entourage when he went to St. Petersburg in 1716 to help plan the city.

The Russian contract issued to Pineau specified work for doors, chimneypieces, frames, tables, ornaments, and other designs. His most admired Russian work was the carved wooden wainscoting for the cabinet of Peter the Great at the Peterhof Palace. The overall design of the room was influenced by the architect of the building – Le Blond – but the individual panels showed the originality of Pineau's work. Although still rectangular in shape, they contain fanciful and elaborate motifs that included military trophies with Russian helmets and weapons. These were all intertwined with an array of other ornaments which included masks, medallions, vegetal forms, quivers, vases, horns, ribbons, cartouches and hermes. Attributes of the Arts and Sciences completed this elaborate approach to decorative panelling which was even more ornamental than anything being done in Paris at this time (c.1720). Peter the Great was extremely pleased with Pineau's work and asked him to remain in Russia after the death of Le Blond (1719); he provided him with architectural and sculptural commissions which eventually included Peter's tomb.

Although Pineau was clearly influenced by the interior designs of Jean I Berain, Gille-Marie Oppenord, Antoine Vassé and Claude III Audran, he was nevertheless one of the first to include an asymmetrical aspect to his arabesque designs, an approach already seen in decorative panels planned for St. Petersburg. These designs consist of elaborate, off-center

Pineau: design for chimneypiece, c.1735–38

C-scrolls that are interwoven with shell motifs, sculpted busts, birds, canopies and youthful figures. These “elegant caprices” quickly gained him patrons after his return to Paris in 1727. For the Duc de Chatillon, he designed the wainscoting and *porte-cochère* for the Hôtel Bethune and many subsequent secular commissions followed. He eventually came to the attention of Louis XV, who commissioned him to do much of the interior decor for the Royal Château of La Muette (1747, now destroyed). Unfortunately, many of Pineau’s French works are no longer in existence. Those that survive are located in the Hôtel de Roquelaure (c.1733), the Hôtel de Marcilly (1738), the Hôtel Tannevot (1740) and the Hôtel de Maisons (c.1740). The *salle de compagnie* of the Hôtel de Maisons magnificently incorporates large, wide mirrors bordered by palmettes into elaborately carved and ornamented wainscoting. The decoration continues in the ceiling, where a rosette pattern of elaborate vegetal forms frames a suspended candelabra.

Pineau’s religious commissions included work for the Church of Saint Louis at Versailles designed by Mansart de Sagonne (1713–44), the Charterhouse of Lugny (1743), and his own parish church of the Penitents de Nazareth.

The diversity, fluidity and elegance of Pineau’s designs is evident in his published works and also in the drawings (more than 450) of his portfolio now conserved in the Musée des Arts Décoratifs in Paris and the Musée Stieglitz in St. Petersburg. In

these works, the interior space is covered with a graceful, elaborate compendium of the popular motifs of the time. Large mirrors are crowned by decorative cartouches and ornamented with cherubs, masks, shell motifs, and garlands. The panelling itself (*lambris*), is curved and carved with canopies, scrolls, cherubs, trophies and an array of ornament only limited by the imagination of the artist. In the case of Pineau, this meant a dizzying display of flowers, figures, and forms often gilded and incorporating works by other painters.

Elaborate chimneypieces were particularly popular with Pineau. A design conserved in the Musée des Arts Décoratifs contains a proliferation of Rococo ornamentation, which includes lion heads, rams, and dragons. Another chimneypiece published by Mariette incorporates a curved and twisted canopy, surmounted by a cartouche and flanked by panels carved with vegetal elements.

The elaborate French interior decor of the first half of the 18th century often contrasted dramatically with the quite reserved exterior elevations. Even so, Pineau was also commissioned to do a number of exterior works, including sculpted reliefs for pediments, ornamental grill work and *porte-cochères*.

The family tradition was continued by Nicolas’s son Dominique Pineau (1718–86). The two worked so closely together at the end of Nicolas’s career that it is often difficult to distinguish their individual works. By the time Pineau *père* (often called Pineau *le Russe*) died in 1754, French taste was turning towards a more reserved and rational approach. Pineau was one of many ornamentalists associated with the Rococo style that was heavily criticized by classicists like Charles-Nicolas Cochin (1715–90) who called their works “practically worthless”. Pineau’s asymmetrical and wildly inventive designs were certainly antithetical to the classical taste, but they were greatly admired for almost half a century by the aristocratic patrons of Rococo exuberance.

Biography

Born in Paris in 1684, the son of Jean-Baptiste Pineau (1652–1694), a sculptor at the Gobelins Manufactory. Trained under the architects Jules Hardouin-Mansart (1646–1708) and Germain Boffrand (1667–1754), and under the sculptor Antoine Coyzevox (1640–1720) and the goldsmith Thomas Germain (1673–1748). Married: son was the architect Dominique Pineau (1718–86). Worked with Robert de Cotte (1656–1735); employed as a designer and carver under Jean Baptiste Alexandre Le Blond (1679–1719) in the service of Peter the Great in Russia from 1716; took over Le Blond’s role as architect from 1719. Returned to France after 1727; active as an architect and designer of interiors and furniture in Paris from 1730. Member, Académie de Saint-Luc, Paris, 1739; appointed director, 1749. Died in Paris in 1754.

Selected Works

Substantial collections of Pineau’s drawings are in the Musée des Arts Décoratifs, Paris, and in the Musée Stieglitz, St. Petersburg. Many of his designs were published in Mariette’s *L’Architecture Française* (1727–38). Pineau’s room from the Hôtel de Varengeville is now in the Metropolitan Museum of Art, New York.

Piranesi, Giovanni Battista 1720–1778

Italian architect, designer, antiquarian and engraver

G.B. Piranesi was one of the seminal figures in European Neo-Classicism, and his exceptional capacity for visual experiment and lateral thinking between such diverse disciplines as architecture, archaeology and the restoration of classical antiquities, had a widespread if oblique impact on interior design. This was achieved less by his few executed works, mainly produced during the 1760s and 1770s, than by his widely disseminated etchings, especially in his publications, the *Diverse maniere* and *Vasi*, and by his personal influence on sympathetic foreign designers studying or working in Rome.

His earliest recorded work in interior design, carried out in certain unspecified palaces in Venice during the late 1740s, no

longer survives, but is probably represented in a group of exquisite Rococo designs for wall decorations and plasterwork, now in the Pierpont Morgan Library, New York. His most significant and productive period was to be the decade of the 1760s, while he was deeply involved in the polemical exchanges of the Graeco-Roman controversy which led to his advocating a highly eclectic contemporary style of design in opposition to the stark aesthetic preached by the German scholar J.J. Winckelmann and the French architectural writers, M.-A. Laugier and J.-D. Le Roy. Defending the originality of the Romans, and their putative mentors the Etruscans, Piranesi issued a remarkable sequence of lavish archaeological folios, sponsored by the newly-elected Venetian Pope, Carlo Rezzonico, Clement XIII. In particular, his *Della magnificenza ed architettura de' Romani* (1761), despite its ponderously erudite text, essentially rested its arguments on plates displaying a wide range of late Roman imperial ornament. Like his earlier archaeological publications (the four-volume *Le Antichità Romane* of 1756, in particular), Piranesi's folio offered exemplars of imaginative licence from antiquity for modern designers to emulate rather than to follow slavishly.

By 1765, with the polemical *Parere su l'architettura* – a debate between a "rigorist" architect and one supporting Piranesi's beliefs in fantasy and richness – Piranesi had moved to a position advocating a style of the utmost eclecticism, mixing Greek and Egyptian as well as Roman and Etruscan motifs. His arguments were to be illustrated by some exceptionally bizarre etched compositions, added to this work shortly after 1767.

This novel aesthetic was to be applied during the mid-1760s to a series of documented but no longer surviving interiors, complete with furniture: for the Pope at Castel Gandolfo; for the Pope's nephew, Cardinal G.B. Rezzonico, at the Quirinal Palace (two surviving gilt side-tables for this commission can be seen at the Minneapolis Institute of Fine Arts and Rijksmuseum, Amsterdam); and for the latter's brother, Senator Abbondio Rezzonico, at his palace on the Campidoglio. Equally significant was Piranesi's pioneering painted interior in the Egyptian taste for the English Coffee House (Caffè degli Inglesi) in Piazza di Spagna, destroyed probably by the end of the century and now only recorded by two etchings of its main wall compositions.

Piranesi's most important contribution to interior design, however, was to be the visual impact of the etched designs in his final polemical publication, *Diverse maniere d'adornare i cammini ed ogni altra parte degli edifizii* ... (Various ways of decorating chimneypieces and other parts of houses). The folio was published in 1769; its 67 plates represented a highly productive decade involving the design of a wide variety of furniture types and fittings, not to mention decorative utensils, coachwork and sedan chairs. Its prefatory essay (with parallel texts in Italian, French and English), addressed to an international audience of designers and patrons, offered a final act of polemical defiance to a world increasingly dominated by the austere tastes of the emerging Greek Revival. Dominating the etched designs were 61 compositions for chimneypieces, ranging from restrained essays, such as already carried out in coloured marble for the Earl of Exeter at Burghley House, Lincolnshire, to eleven examples in the Egyptian style and several intentionally provocative confections, complete with

Piranesi: design for chimneypiece with flanking chairs, using Etruscan motifs; engraving from *Diverse maniere ...*, 1769

flanking furniture and hints of wall systems, including one in the Etruscan mode. The swift effect of these plates, as a source for developing new concepts or extracting motifs, can be seen on a number of European designers by the 1770s, such as J.-C. Delafosse, F.-J. Bélanger and, most notably, Robert Adam, whose revolutionary interiors at Kedleston, Syon and Osterley had already been considerably inspired by contact with Piranesi during his studies in Rome between 1755 and 1757.

Piranesi's last decade, affected by the decline of Rezzonico patronage after the Pope's death in 1769, was occupied with, among many other activities, further production of ornamental chimneypieces (some half dozen have so far been traced), and the highly imaginative restoration of classical antiquities, particularly directed at the Grand Tour market. Many of these latter works were etched by way of advertisements for sale and directed to a growing clientele of British patrons and collectors. Eventually collected together and published in 1778, the meticulous plates of Piranesi's *Vasi, candelabri, cippi, sarcofagi* ... were to have a considerable impact on the increasingly archaeological tastes of the British Regency, represented by leading interior and furniture designers such as Thomas Hope and C.H. Tatham, and of the French Empire, as seen in the works of Percier and Fontaine.

JOHN WILTON-ELY

See also Egyptian Revival

Biography

Born in Mogliano, near Venice, 4 October 1720, the son of a stonemason and master builder. Apprenticed to his uncle, the architect and hydraulic engineer Matteo Lucchese, then to Giovanni Scalfarotto, Venice; instructed in perspective composition by the engraver Carlo Zucchi, and trained in stage design by the Valeriani brothers. Married Angela Pasquini, Rome, 1752: 5 children. Travelled to Rome as a draughtsman in the retinue of the Venetian Ambassador, Marco Foscarini, 1740; studied etching and engraving in the studio of Giuseppe Vasi (1710–82); worked at the Palazzo Mancini, French Academy, as a painter of scenery and sets for ceremonies, early 1740s. Visited Naples and returned to Venice, 1744. Lived in Rome from 1745; active as an engraver and print-seller and as a designer of architectural fittings. Published numerous sets of topographical engravings including the *Vedute di Roma* (1745) during the 1740s; commenced publication of archaeological works which included *Antichità* (1756) from 1750. Established independent design and print-making business, Via Sistina, 1761; involved in the design of several architectural projects, interiors and furnishings during the 1760s, and active as a dealer and restorer of antiquities throughout the 1770s. Prints circulated internationally and objects created out of antique fragments exported to England, France, Sweden and Russia. Elected Honorary Fellow, Society of Antiquaries, London, 1757. Died in Rome, 9 November 1778.

Selected Works

Important collections of Piranesi's designs, including drawings of chimneypieces, *boiseries* and wall panels, are in the Pierpont Morgan Library, and the Avery Library, Columbia University, both New York. Additional studies for chimneypieces are in the Kunstbibliothek, Berlin. The tables made for Cardinal Rezzonico's apartments in the

Quirinal Palace are in the Minneapolis Institute of Fine Arts, and the Rijksmuseum, Amsterdam. Examples of chimneypieces after Piranesi's designs still *in situ* are at Burghley House, Northamptonshire, Gorhambury House, St. Albans, Hertfordshire, and Wedderburn Castle, Scotland.

Planning and Arrangement of Rooms

The layout of the early medieval house was simple. The dominant element was the hall, a large room with a central hearth, where the entire household, the lord, his noblemen and his servants, all gathered to eat. Social hierarchy was maintained with the lord of the house sitting alone on a dais at one end, while his knights and servants ate below him. Food was ceremoniously brought through the hall to the dais from the kitchen. This was behind a passage screened from the hall by three arches. As social divisions between servants and masters became more pronounced, a chamber, or Great Chamber, was added to the first floor as a retreat for the lord of the house where he would sleep, entertain and dine.

Important members of the household or guests lived in lodgings which developed during the 14th and 15th centuries. Lodgings often included a principal chamber, a closet, and an inner and outer chamber. They were built in ranges around a courtyard, as in the traditional Oxford and Cambridge colleges and Dartington Hall, Devon of 1390. The closet was a small private room to which the owner of the house could retreat for contemplation, business or prayer, like the *cabinet* in France and the Italian *studiolo*. The French version of the lodgings were private *appartements*, as in the remodelled Louvre of 1360 which included a state room, bedroom, library and oratory in the castle keep. The parlour developed from monastic traditions as a room for conversation and became popular as a less formal living room.

In medieval town houses the ground floor had workshops or commercial offices with the general space for living and eating either at the back of the house or on the first floor. The inhabitants socialized, ate and slept together in one room, although there is evidence of light-weight partitions which allowed for more private spaces. In the Palazzo Davanzati in Florence of the late 14th century, the ground floor housed commercial offices, the first floor had a large public room and private family apartments, the second floor housed more family and guests, and the attic was for the servants. By the 14th century the kitchen was moved from the centre of the house to the rear courtyard, which improved domestic hygiene.

The developments of the Renaissance brought further changes in domestic planning. Palladio's villas separated the public rooms from the private. He advocated organizing the house on a basement (partly underground) which contained the kitchens and servants' day-rooms. The ground floor consisted of a central hall off which the smaller rooms opened. In *Palladio's Villas* (1990), Paul Holberton writes that it is difficult to identify the uses of these peripheral rooms. Often living rooms were slept in by the owner or his guests, and the household would remove the furniture when it travelled, thus leaving little evidence about the rooms' functions. Palladio does distinguish the *studiolo*, or private room of the owner, and he defines *mezati* as small rooms, often on the top floor, which were considered inappropriate for gentlemen. He recommends that smaller rooms on the south and west sides of the house should be kept as winter rooms, while summer rooms could be larger and facing north.

The gallery became a popular room in the 16th century and was fashionably hung with tapestries and portraits. Mark Girouard points out in *Life in the English Country House*

(1978), that the typical layout of a grand house in the mid-16th century included the great chamber, a withdrawing chamber, the best bedchamber and a gallery, all *en suite* on the first floor. Progress through such an alignment of rooms would heighten the sense of drama and ceremony as the visitor was led to the great chamber for his privileged audience.

Segregation and privacy became more desirable in the 17th century. Sir Roger Pratt and Roger North wrote independently of the growing need to remove servants from the core of the house. In some instances, the kitchens and staff areas were moved to the wings. In Coleshill, Berkshire of c.1657–c.62 by Sir Roger Pratt, the servants' space is in the basement. The private sets of rooms are arranged symmetrically around the great chamber, and are accessed by servants through the back stairs. The symmetrical and hierarchical arrangement of the major rooms is similar to that at Vaux-le-Vicomte of 1656–61 designed by Louis Le Vau, where an imposing *enfilade* culminates in the bed-sitting room in which visitors were received.

In the late 17th century, the dining room began to play an important role in the social life of the domestic house, and new rooms were provided for card playing, music, libraries, the display of art works and the receiving of guests. In some French hôtels, these living areas were placed between the courtyard and the garden, set away from the street's noise. New efforts to provide greater privacy can be seen in the Hôtel Crozat by Pierre Bullet of 1700–02, where the public rooms are still aligned in *enfilades*, but the bedrooms are set apart.

Segregation of the classes and sexes is most pronounced in the planning of the house in 19th-century England. For example, in Bear Wood by Robert Kerr of 1865–70 the female servants were isolated from the male, and the servants in general from the family of the house. Similarly, men and women had rooms in which they socialized together, and rooms which were only frequented by one sex or the other. The drawing room and morning room were considered to be the female domain and were decorated accordingly. The library and billiard room (or smoking room) were male haunts, and the dining room had masculine decor, although women ate there as well. The medieval hall was revived in large houses as part of the revival of Gothic architecture.

By the end of the 19th century, the strictly ordered plan was loosening up. The work of H.H. Richardson, and Frank Lloyd Wright in America was highly influential in England and later Europe. Wright broke down the defining walls of the public rooms, allowing a free flow of space. In his Willits House of 1902, in Highland Park, Illinois, the kitchen, living room and dining room are separated from each other only by a great central hearth. In England, C.F.A. Voysey and M.H. Baillie Scott adopted some of Wright's ideas, and Baillie Scott's work was influential on the Continent.

In the 20th century such open floorplans can be seen in Le Corbusier's *Citrohan* houses from the 1920s, and in the work of Europeans such as Adolf Loos and Mies van der Rohe, and the American Philip Johnson. In Johnson's Richard Davis House (1952) in Wayzata, Minnesota, the interior of a square is vaguely articulated into different spaces identified as the living room, dining room, library and bedrooms, but they are divided only by partitions. The kitchen, utilities and garage are placed in a connecting rectangle. In a sense, this highly sophis-

ticated design for a house has come full circle to meet the medieval plan in which living, sleeping and eating places were equally undefined and loosely arranged.

Plasterwork and Stucco

Plaster is a wonderfully versatile material: it can be modelled into large-scale pieces of sculpture, moulded into decorative motifs, or simply used to seal walls and ceilings against drafts and dust. In the Midlands of England there are even plaster floors, made from the 16th to the 18th centuries, of locally mined gypsum laid on reeds.

Gypsum (calcium sulphate) occurs across Europe, but is often known as “plaster of Paris” from the large deposits found under Montmartre. It has always been a favourite basic ingredient for plaster because of its quick-setting qualities. A fine alternative, even more readily available, is lime (calcium oxide), which is produced by burning limestone, then soaking or “slaking” it in water so as to reduce its causticity. Both lime and gypsum act as setting and hardening agents, but have to be mixed with larger quantities of sand and hair so as to give the plaster body. Quite what else went into the mixture varied according to budget and artistic ambition. Basic low-class plaster might be padded out with hay, straw, cow-hair and dung; fine work required fine sand and the best white goats’ hair. For decorative work the recipe might also include lard, gelatine, curdled milk, egg-white or fig juice, to help slow down the setting time, increase plasticity, and control shrinkage. In Italy, lime and ground-up marble dust made up the brilliantly smooth “stucco” described by Vitruvius in the 1st century BC and by Vasari and other writers from the 16th century onwards.

For a decorative base, plaster has always had to be built up in layers, with coarse undercoats keyed to take finer topcoats. Vitruvius, in the seventh book of *De Architectura*, recommended an initial rendering coat, at least three layers of coarse sand plaster, then three more of marble-dust stucco as a fit base for painted decoration. He also outlined the advantages of fresco technique, pointing out that paint laid on a wet top coat is absorbed into the plaster and so proves more durable. The villas at Pompeii still bear witness to this fact. Vitruvius’ comments on relief decoration in plaster are more limited: he advised that impost mouldings be kept slender and therefore light, and that they should not be made of gypsum lest they set too fast and shrink. For methods of application we have to turn to later practices. Continuous mouldings might be “run” with a shaped template, low relief details pressed into shape *in situ*, using moulds. More complex motifs could be built up from separately moulded pieces fixed onto hidden nails, or modelled from plaster that was still damp. Boldly three-dimensional effects relied on frameworks of wood or metal armatures. As styles changed these techniques were all exploited to various degrees.

Before examining the major European developments, it is worth pausing to consider Islamic plasterwork. Moulded plaster panels were particularly suitable for covering walls with the repetitive interlace patterns, stylised foliage and flowing calligraphy favoured by Islam, and the play of shadows in intense sunlight could be increased by deeply undercutting the surface design. Fabulous examples can be found in Moorish Spain at Granada, where the 14th-century walls of the Alhambra are covered in stucco panels, and the vaults are hollowed out into a fantastic honeycomb of stucco stalactites. The Spanish love of densely-packed surface decora-

tion remained long after the Moors had left, re-emerging in Gothic, Renaissance and later fashions. In the sacristy of the Cartuja at Granada (1727–64) the profusion of stepped stucco mouldings and scrolls have a bold Mexican flavour, but the overall effect of dense richness still harks back to the Alhambra.

Elsewhere in Europe there was little interest in decorative plasterwork until the Renaissance and the late 15th century excavations of the Golden House of Nero in Rome. These revealed a wealth of stucco relief work and a whole repertoire of classical designs – sphinxes, griffins and other mythological figures, and the delicate arabesques and acanthus swirls that became known as “grotesques” (from the grottoes). The motifs were closely studied by Raphael, the composition of the stucco by his assistant Giovanni da Udine. The two then recreated the style in the Vatican Loggia, for Pope Leo X, and at the Villa Madama (c.1515–25) for his cousin, Cardinal Giulio de’ Medici. These first essays were mostly moulded in low relief, the classical decoration contained in small medallion or coffer panels on the piers and arches, but with freer flowing arabesques on the pendentives.

Students of Raphael spread the style further afield and adapted it for more striking effect. Giulio Romano’s Loggia in the Palazzo del Te at Mantua (1526–c.34) had low stucco reliefs in the Villa Madama manner, but his Sala degli Stucchi was more ambitious, with mythological scenes and a two-tier frieze of Roman soldiers in procession. Moreover, he used stucco to cover all the exterior façades of the palace, feigning rusticated stonework with architectural Mannerist “jokes” such as dropped triglyphs and half-finished columns. One of Giulio Romano’s assistants at Mantua, Francesco Primaticcio, left for France in 1531, and worked with Rosso Fiorentino on the decoration of the state apartments of François I at Fontainebleau. Here the stucco work became most exotic. Painted panels were set into lavishly moulded stucco frames dripping with heavy fruit swags, and topped with fulsome stucco putti. To either side of the panels, sometimes supporting the frame, were large figures, typically female nudes with long limbs and elegantly languid poses, sensuously modelled in stucco so as to be almost fully three-dimensional. Daringly raised arms (formed around internal armatures) exploited the sculptural freedom of working with stucco as opposed to stone. It is thought that the figures may be by Jean Goujon.

From Fontainebleau, the trail leads to England and Henry VIII’s new palace of Nonsuch (1538–47). This was a timber-framed building, and Nicolas Bellin of Modena, fresh from the Galerie Francis I, was employed to cover the timbers with decorative slates. It is highly likely that he was also responsible for the exterior stucco panels, decorated with the “kings, Caesars, sciences and gods” described by Anthony Watson at the end of the 16th century. Nonsuch fell into ruin during the late 17th century, and only a few stucco fragments of fruit swags and cherub heads survive. Its courtly style was directly imitated in only a few instances (e.g., a stucco overmantel at Broughton Castle, with nudes supporting a panel of dancing dryads), but it did much to open the eyes of local craftsmen to the decorative possibilities that stucco, and plaster, presented.

Late 16th and early 17th century country houses in Britain abound in the most wonderful plasterwork, not always sophisticated but riotous and enjoyable, and particularly suited to the

Plasterwork: bedroom, Stockton House, Wiltshire, by Henry Briggs, 17th century

great expanses of a long gallery or great chamber ceiling. These are broken up by patterns of plaster ribs, the ribs narrow and moulded at first, but from the 1590s generally broader, flatter and filled with trails of flowers or vines. The finest ceilings culminate in fabulous Gothic-style pendants. In between the ribs are stylised flower sprays, little animals, heraldic devices, Flemish strapwork patterns, and even figurative panels. These might illustrate biblical themes (as at Llanhydrock in Cornwall), or show allegorical figures of Virtues, Seasons or the Five Senses (as at Boston Manor, Middlesex). There was also a great fashion for emblems, or pictorial riddles; those at Blickling in Norfolk derive from Henry Peacham's emblem book *Minerva Britannia*, of 1612. By specifying such allegorical figures and scenes, a patron could establish a personal, moral or encyclopedic theme for a room, and even follow it through in the decoration of ceilings, friezes and overmantels elsewhere in his house.

At Blickling, we know that the plasterer was Edward Stanyan. At Hardwick Hall in Derbyshire, the continuous stucco hunting frieze, with trees modelled round real saplings (and unusually painted in naturalistic colours), was created by Abraham Smith and his team. Elsewhere plasterers generally remain anonymous, though their work is occasionally identifiable from the repeated use of a particular mould. Strikingly similar medallions with Heroes' heads, for instance, appeared in north London houses at Tottenham and Canonbury, and at Bromley-by-Bow, but could also be found at Balcarres House in Scotland. Did the London plasterer travel north, or sell his moulds? Or did a different plasterer base his design on the

same engraving? Whereas late 16th century plasterers had shown great personal inventiveness in their designs, their successors in the early 1600s came to rely much more on standardised sources, such as the engravings of Nicolas and Abraham de Bruyn, Crispin van de Passe or the strapwork patterns of Vredeman de Vries. The inspiration therefore came from Flanders and Holland, and only indirectly from France and Italy.

By the 1620s this was beginning to change. Inigo Jones introduced a much simpler style of decoration (still visible at the Banqueting House, Whitehall and the Queen's House, Greenwich), with ceilings divided into compartments by plastered beams enriched with proper classical mouldings – acanthus, guilloche, egg-and-dart, modillion brackets and beading. In the centre might be a large round or oval panel, intended for painted decoration. Plasterers of the 1650s and 1660s accepted Jones's format, but not the classical restraint, and by the 1670s and 1680s they had begun to enrich their ceilings with truly lavish detail. Central panels were surrounded by luscious wreaths of realistic fruit, flowers and seed pods, each piece individually moulded and separately applied. Outer panels were filled with sprays of foliage, the rich acanthus scrolls and drooping palm fronds taken still damp from the moulds and bent into position. The plaster worked around leather straps, then hung into place as ribbons or festoons, was also applied while still damp. Shell motifs and little putti appear as well, providing a rich texture enhanced only by a final coat of whiting – gilding was rare at this date, and colour was reserved for any painted panels. A really splendid sequence of these ceilings by Robert Bradbury and James Pettifer can be seen at Sudbury Hall, Derbyshire, (1675–76). Other masterly examples are by Edward Martin, Edward Goudge and John Houlbert.

This very rich style of British plasterwork has obvious parallels on the Continent, especially in Southern Germany and Austria. Here, wealthy abbey were building themselves grand new churches and reception rooms, fostering their own craft workshops to provide the decoration. Wessobrunn Abbey, in Southern Bavaria, became particularly noted for its plasterers, Johann Schmuzer being responsible for the gorgeous stucco work in the Fürstengang (Gallery of the Princes) of 1685–90. His extravagant acanthus leaves, foaming out of urns and scrolling round scallop shells, demonstrate techniques similar to those used in Britain, and were likewise finished in white.

During the second half of the 17th century, however, central Europe was increasingly influenced by the dramatic spirit of Roman Baroque art. Bernini, sculptor as well as architect, had used plaster for moulds and models, and readily exploited its lightness and flexibility in his extravagant ensembles – St. Theresa is dazzled by gilded stucco light rays in the Cornaro chapel (1645–52), and St. Peter's Chair floats weightlessly among puffy stucco clouds. In both these contexts stucco was no longer treated as a separate discipline, but just another medium, alongside a fabulously rich array of bronze and polished marble. In such company it ceased to be a mere artisan material and was handled with new ambition and virtuosity. The wonderful stucco angels that welcome visitors up Bernini's Scala Regia (1663–66) in the Vatican are a supreme example – they are poised so effortlessly above the archway,

their draperies billowing freely in the breeze and their arms outstretched to hold their trumpets. The stuccoist responsible was Antonio Raggi.

Bernini's great contemporary, Borromini, used stucco more as an enhancement of architectural form, with bold mouldings, cornices and coffers flowing round his walls and domes and breaking out into the space inside. Borromini himself also served as a link between Rome and the "Comacini" plasterers and decorators from the area around Lakes Como and Lugano in North Italy. Both he and his favorite plasterer, Giuseppe Bernasconi, came from that area, as did many others who took the style across the Alps into Central Europe and Scandinavia. In terms of secular decoration their work was richly sculpted and heavy with fruit swags, foliage, mask-heads and putti, but with ecclesiastical commissions there was more scope for true Baroque drama. The great monastic church of St. Florian, near Linz in Austria, for instance, was decorated in the 1690s by Giovanni Battista Carlone (from Scaria near Lake Lugano) – he furnished the gallery arches with stucco curtains drawn back by stucco putti, and perched fully sculpted stucco angels precariously on the impost blocks, leaving their legs to dangle freely into the nave.

In the early years of Louis XIV's reign, France cultivated its own sense of Baroque magnificence with the interiors of Charles Le Brun. These featured some superb stucco work – sixteen stucco caryatids "hold up" the oval dome at Vaux-le-Vicomte (1658–61), while at Versailles (1670s) the *Galerie des Glaces* is enriched with gilded stucco trophies and putti, and the *Salon de la Guerre* is dominated by Antoine Coysevox's great stucco panel of Louis XIV on horseback. These sculptural examples, however, were soon overshadowed by the grandiose painted schemes that brought Baroque art to its climax, with painted illusionistic architecture opening up into vast heavens full of gods and goddesses. Plaster and stucco work in France, as in Italy and Britain, went into temporary decline until c.1710.

During the 18th century plaster and stucco work reached new heights of popularity and sophistication. Styles varied across Europe as the Baroque legacy of opulence and dramatic virtuosity was variously tempered by a new French taste for the prettily decorative. Designers such as Jean Berain, with his patterns full of interlace bands, fancy ribbons and delicate mythological motifs, had introduced a more light-hearted approach to decoration, full of whimsy, and eager to divert rather than impose. In plasterwork this materialised in the white and gilt ceilings at Versailles – the *L'Oeil de Boeuf* antechamber (formed in 1701) has coving covered with gilt diaper patterning and an informal frieze of gilt children, all playing or holding garlands. The motifs are cast or modelled in low relief, and serve as background decoration. They do not mould the character of the room in Baroque manner. By the 1730s this French style had developed into an even more refined version of the Rococo, a supreme example being the ceiling of the *Salon Oval* of the *Hôtel de Soubise*, Paris, designed by Germain Boffrand. Here the most deeply modelled features are the delightful stucco putti which frolic astride the wavy cornice of the room. The cornice itself, and the central "hub" and "spokes" of the ceiling are all composed of leafy C- and S-curves and exquisite flower garlands, all contributing to

a delicate but lively froth of decoration, continuing the style of the carved wood panelling down below.

In Germany and Austria, where plasterwork had never been so completely eclipsed by painted decoration, the Baroque tradition survived more strongly at first. The most extreme instances are again ecclesiastical. Bernini himself would surely have relished the theatrical drama of Egid Quirin Asam's altarpieces at Weltenburg (1718–23) and Rohr (1721–23), both composed like scene sets with hidden lighting and a stucco cast, the Virgin at Rohr borne up to heaven by flying angels and an armature hidden in the stucco curtain behind. Other German designers retained Borromini's sense of flowing architectural form and covered it with exuberant but somewhat frothier stucco work, adopting the new French motifs and delicacy of style. The effect can be very sugary, as at the pilgrimage church at Wies in Bavaria, built and decorated by the Zimmermann brothers (Dominikus and Johann Baptist), along with other stuccoists from Wessobrunn, in 1746–54. The crust of stucco scrolls, cartouches, garlands, putti and lattice work, all picked out in gilt and pastel shades, is just like the icing on a wedding cake.

At Munich, however, the stucco work of Johann Baptist Zimmermann has a very different quality. Zimmermann was working here in the 1730s at the Elector of Bavaria's Nymphenburg Palace, newly extended by the French architect François Cuvilliers, and his style is much more delicate and delightful. His ceiling in the *Spiegelsaal* (Hall of Mirrors) of the Amalienburg Pavilion is a masterpiece of naturalistic detail, all in silver stucco on a pale blue background. Birds flit across the "sky", and realistic leafy branches rise from the cornice behind informal groupings of urns, putti and nymphs. The figures are posed at ease on the cornice, dangling their legs, and free-hanging garlands of flowers or shells, over the edge. The work is full of imagination and grace, and must have been produced by modelling all the details individually. There were no short-cut techniques here.

Another German family of stuccoists to embrace the French style were the Feichtmayers, also of Wessobrunn. Best known is Johann Michael Feichtmayer, who worked at the great churches of *Vierzehnheiligen*, *Zwiefalten* and *Ottobeuren*, and at the episcopal palace at Bruchsal. His decoration of the stair landing at Bruchsal (1752) features splendid Rococo scrolls, freely composed into an irregular frieze, and a magnificent freestyle cartouche of asymmetrical scrolls over the doorway.

The "Comacini" plasterers from North Italy were also busy in Germany and Austria at this time. Antonio Giuseppe Bossi produced a very free Rococo style of decoration in the *Weissersaal* of the Würzburg Residenz (1744), but his compatriots were less completely subject to French influence. They accepted the new delicacy and flowing decorativeness of the French style but remained more Italianate and classical in their choice of motifs. Typical is the work of Santino Bussi in the entrance hall of the Upper Belvedere, Vienna (1721–22), where the vaulted ceiling is covered with low relief mythological scenes in frames prettified with interlace and delicate scrolls. The vaults spring from capitals crowned with Roman military trophies, and the capitals in turn rest on four carved stone figures – Baroque titans stooping under the weight. Titans reappear, in stucco, in the palace of the Elector of Cologne at Brühl, where they act in pairs as giant figure brackets holding

Plasterwork: gallery, Strawberry Hill, Twickenham, 1750s

up the ceiling of the grand staircase. The Italian stuccoists at Brühl were directed by Giuseppe Artari and did not complete their work until the early 1760s.

Artari had spent much of his life working in England, another major haven for the "Comacini". He is first recorded there as working with fellow Italian Giovanni Bagutti in the Octagon at Orleans House, Twickenham in 1720. Together they decorated the vault with delicately shaped panels of gilt diaper ornament and pretty foliage trails, but featured classical busts in roundels and Italianate putti over the pediments. They continued to work together for the architect James Gibbs, and probably collaborated at Moor Park, Hertfordshire, where Bagutti is documented in the early 1730s, and at Clandon Park in Surrey. Their stucco work illustrates the more formalised, serious style then favoured in England. At Moor Park the hall has stucco reliefs of Michelangelesque nudes and Roman trophies arranged around an illusionistic painted cupola, still very Baroque in manner, and large stucco figures seated on the doorcase pediments. At Clandon the hall ceiling is completely stuccoed, with a scene of Hercules and Omphale in a central roundel, surrounded with draperies, classical mask-heads and

half-hidden trophies. The design is ingeniously foreshortened, with nudes holding up a broken architrave and putti sitting on the cornice. Similar sophistication is found at Ditchley Park in Oxfordshire, where Artari was working in 1725 for William Kent, alongside two other Italian stuccoists, Francesco Vassalli and Francesco Serena.

The virtuosity of the Italian stuccoists was never really matched by native English craftsmen, who proved unwilling to tackle the human figure in such a sculptural way, or embark on such ambitious designs. They were happier working in a purely architectural context, but with increasing lightness of touch: in 1725 Isaac Mansfield decorated the heavy ceiling ribs of the long gallery at Blenheim with elaborate plaster mouldings; in 1744 Thomas Roberts of Oxford contributed to the beautifully delicate coffering of the Radcliffe Camera dome (along with Artari and Charles Stanley), and by 1764 he was creating exquisite arrangements of fully-sculpted stucco violins, trumpets, horns etc., for the upper walls of Christ Church library. Thomas Perritt's ceilings at Temple Newsam, Yorkshire (1741–47), and Thomas Clark's fanciful gilt scrolls for the Music Room of Norfolk House, London (1755, now in the

Victoria and Albert Museum), both show a clear debt to the Rococo style. Less obviously Rococo but just as fanciful in spirit is the peculiarly English “Gothick” plasterwork, notably the wonderful plaster fan vaults created at Strawberry Hill for Sir Horace Walpole in the 1750s, and at Arbury Hall, Warwickshire for Sir Roger Newdigate in the 1770s and 1780s. The latter were created by local plasterers – William Hanwell, William Wise and G. Higham – under the direction of Sir Roger and his architects, Henry Keene and Henry Couchman.

English plasterwork after 1760 was dominated by the firm of Joseph Rose and family. Joseph Rose, Sr. had been a pupil of Thomas Perritt and worked chiefly for the architect James Paine. Joseph Rose Jr., his more famous nephew worked for the Adam brothers, James Wyatt and James (Athenian) Stuart. Their work was therefore subject to the European-wide change in fashion that swept aside all Rococo fancies in favour of anything that smacked of Ancient Rome and, eventually, of Ancient Greece. This new style, known as Neo-Classicism, could be monumental at first, as in Robert Adam’s Anteroom at Syon, Middlesex, where gilt stucco trophies adorn the walls and gilt stucco statues surmount real Roman columns of dark green marble. However the Long Gallery at Syon, likewise decorated by Rose in the 1760s, shows a more typical trend to a gentler, restrained style of decoration. It has very low-relief moulded plasterwork, inspired yet again by the remains of classical Roman grottoes, and is carefully ordered into a structure of flat ribs and compartments. The Adam repertoire of honeysuckle blossoms, scrolling leafy trails, husk garlands and fans is unmistakable, here picked out with gilt against a softly-coloured ground of pink and pale green. In the Library at Kenwood, North London, the vaulted ground is also pastel and the coffer-like panels give a similar sense of order, but Rose’s motifs are kept lacey white and appear even more delicate.

Along with the fashion for Neo-Classicism came a change in working practices. Rose may have been responsible for the quality of his plasterwork but he was no longer responsible for its design. At both Syon and Kenwood he was obliged to follow closely the drawings supplied by Robert Adam, who later published them in his *Works in Architecture* of 1773–79. The Adams’ rival, Sir William Chambers, went into partnership with his plasterer, Thomas Collins, but likewise kept him to order, requiring him to follow designs similar to those Chambers published in his *Treatise on the Decorative Part of Civil Architecture* in 1759. Such pattern-book designs took precedence because of their claim to Classical authenticity, and could be bettered only by illustrated accounts of excavations at Classical sites. Robert Wood’s *Ruins of Palmyra* (1753), for instance, inspired a whole series of ceilings with octagonal coffers and central sunbursts, at Osterley, West Wycombe, Drayton, Woburn Abbey and Milton Abbey. Plasterers were becoming trapped – they could interpret these sources, but they were no longer expected to invent. The presentation of correct Classical motifs from an approved source, evenly repeated from the same mould, had become more respectable than any display of imaginative flair or adventurous modelling. The art of plasterwork was being reduced to a mere craft.

Restrictions on the plasterer were further increased by developments in the composition of plaster itself. During the

late 17th century the English had begun to try out Dutch recipes using lime made from ground or burnt cockle shells, and had found the resulting plaster to be finer in quality and more durable. Experiments were then made with different shells, sands and oils, and the results were jealously guarded and eventually protected by patent. Charles Neville’s patent of 1744 was followed by David Wark’s in 1765 and John Liardet’s in 1773. The Adam brothers bought up the latter and renamed it “Adams’s new invented patent stucco”. Only with their permission could the new formula, much publicised and greatly in demand, be used.

As controls over the craft increased, it is not perhaps surprising that architects began to use plasterwork in a more subordinate role. By the 1790s and early 1800s the interiors of George Dance, for instance, were being finished with the most delicate of plaster skims, finely textured with intricate Neo-Classical coffer patterns and mouldings in very low relief, but barely impinging on the all-important spatial design of the room. Sir John Soane was even more purist, emphasising the flat surface of his walls with smooth plaster broken only by discreet mouldings, sometimes recessed into the surface. He tended towards simpler, straightforward mouldings, such as beading, reeding, Greek fret and austere paterae, in preference to the more florid classical forms, and drew attention to the novel flatness of his vaults with shallow fans and flutes. Plasterwork was becoming mere clothing for architectural form.

Architectural purism continued to limit the scope of plasterwork well into the 19th century. As serious Gothic replaced the whimsies of the 18th century, proper stone vaults were required instead of plaster pastiches, and as later revivals followed so did the fashions for wooden panelling and wooden ceiling ribs or beams, tiling and moulded ceramic detail, mosaic and painted decoration. Only in extraordinary instances, such as the amazing Elizabethan / Baroque decoration of c.1840 at Harlaxton Hall, Lincolnshire, or the fantasies of the Paris Opéra, were plasterers given free rein.

The decline of plasterwork as an art did not, however, mean its death as a craft. It simply went downmarket. Plaster moulds had become so stock-in-trade by the end of the 18th century that they became affordable lower down the social scale. Developers building the polite new squares and terraces that spread north of Bloomsbury and around the west end of London, thought houses incomplete without Classical cornices or friezes to adorn at least the main reception rooms on the first floor. No particular individuality was required – just a standard range of honeysuckle motifs, Greek frets or wave patterns, with a central rosette or patera to adorn the ceiling and support the chandelier. Designs could be chosen from pattern books or catalogues and supplied ready-moulded.

Later in the 19th century this type of “town house” decoration became even cheaper and more widely available as a competitive variety of plaster substitutes were invented. “Fibrous plaster” was patented in 1856, its canvas content allowing for greater strength, manoeuvrability and the pre-casting of large detailed panels such as ceiling roses. These became grander and most elaborate, with acanthus fronds helping to disguise the vent holes for the new gasoliers. Friezes also abandoned restraint and revelled in a fresh display of motifs appropriate to the style of the house – vaguely Rococo

Plasterwork: hall ceiling, Holkham Hall, Norfolk, by Thomas Clark of Westminster, c.1760

swags and floral festoons for Classical buildings, mini pointed arcades and quatrefoils for one with Gothic pretensions. Towards the end of the century a Tudor revival, with a penchant for patterned ceiling ribs, made particular use of papier-mâché and the new light-weight “compositions” of wood pulp, paper and canvas. These could even be compressed into textured papers such as Anaglypta or Lincrusta, and so provide instant friezes or overall ceiling decoration wherever required. By 1900 even the most standard of middle-class suburban terraces would boast an ornamental frieze around the hall, and another, along with a decorated ceiling or a fine rose, in the front parlour. Rear and upper rooms would have at least a simple cornice.

Twentieth-century Modernism disapproved of such frivolity, advocating pure forms with smooth walls and ceilings. Since the 1970s, however, there has been a mounting passion for “period detail”. A heightened appreciation of historic buildings, and a stricter approach to their restoration, have increased the demand for traditionally skilled craftsmen and the use of old plaster recipes. One of the most extreme instances of this revival has been at Uppark in West Sussex, where elaborate 18th-century ceilings, burnt out in 1989, have been completely reconstructed by the workshops of the National Trust. Less ambitious home-owners can purchase a range of pre-cast authentic historical mouldings, in plaster, fibrous plaster or composition, from specialist suppliers such as Locker and Riley, E. J. Harmer and Co., George Jackson and Sons, or W. G. Crotch. Even ordinary builders’ merchants and DIY warehouses sport a limited range of covings, mouldings and ceiling details made out of high density polystyrene or polyurethane. Plaster’s touch of style is now available, at suitable prices, for all.

Plastics

Being the most protean of materials, plastic (meaning “mouldable”) has been alternatively acclaimed and derided for many years, yet no other 20th-century material has done more to shape the Western world. Its use has revolutionised mass consumption and has encompassed everything from industrial components to jewellery and clothing. Plastic furniture has both adorned the interiors of the avant-garde and withstood the rigours of social security offices and prison canteens.

Plastic occurs naturally in amber, horn, bone, and tortoise-shell and these materials have been used for centuries for the luxury goods market. But it was not until 1869 that Alexander Parkes patented the first alternative to natural plastic – Celluloid – a semi-synthetic plastic made from a naturally occurring polymer. The first truly synthetic plastic was developed by the Belgian chemist Leo H. Baekeland, c.1907 and was called Bakelite. Early Celluloid and Bakelite products imitated more expensive materials such as wood, but from the 1930s plastic began to be appreciated for its own intrinsic properties and its subsequent development was closely linked to Modernist and progressive tastes.

Plastic as *the* democratic material is bound to the modern age by its capacity to be mass-produced by industrial means and also by its potential to fulfil every whim of its designer. Plastic synthetic products also suited the modern age’s rejection of the tyranny of expensive craft techniques while also providing a smooth, undecorated look. Plastic laminated surfaces, simulating natural wood or marble effects, were applied to furniture throughout the 1920s.

Marcel Breuer’s *Laccio* table of 1925 is cited as the first example where a synthetic plastic material is incorporated into a piece of furniture, in the black celluloid lacquer top of the tubular steel table. No doubt the luxurious, sleek surfaces of Japanese furniture were the inspiration for the Modernists’ predilection for plastic finishes, just as oriental sources had inspired earlier japanned papier-mâché pieces. Craftswoman, architect and furniture designer Eileen Gray not only emulated Japanese lacquerwork directly, but also used celluloid lacquer panels in her bowed *Celluloid Screen* of 1931. As tubular steel furniture suited the utopian, functional ideals of Modernism, new laminates were developed from moulded high-gloss, synthetic resins, and tubular steel and plastic surfaces were combined by Breuer and Wassili and Hans Luckhardt, as seen in the latter’s Berlin diningroom illustrated in *Innen-Dekoration* of 1931.

Formica laminate was ubiquitous in the commercial environments of theatres, cafes and launderettes in the 1930s, especially in the United States, promising a hygienic, modern interior of utilitarian certainty. Laminates were created by industry in its search for insulating materials, just as the 1920s plastic

radio boom had developed alongside the rise of the car factory. Originally imitating large pieces of furniture, radios had wood-grained, laminate finishes. Pearlised, grey formica surfaces were to decorate the interior furniture of the *Queen Mary* liner – high status, indeed.

Plastics and the industrial designer had a symbiotic relationship in the 1930s and soon the magazine *Popular Mechanics* could assert, “Americans of tomorrow will live in a plastics house, drive a plastics auto and fly in a plastics airplane”. But with the growth of cheap, plastic consumer products, often poorly made by US industrial giants such as Du Pont, increasingly plastics became associated with vulgarity and shoddiness.

World War II stimulated research into plastics, notably for aircraft cockpit-covers from plexiglass and fibreglass-reinforced polyester resin which had been developed by naval research. These developments inspired the post-war architects and designers Charles Eames and Eero Saarinen to produce some of the most influential American furniture designs of the mid-20th century.

Post-war uncertainties led to a move away from the geometrical austerity and angular abstraction of the 1920s and 1930s, and towards the more comforting, organic, feminine curves of softer surfaces. Eames, and his wife Ray, and Saarinen developed a modern vocabulary of chair design at the Cranbrook Academy of Arts, fully exploiting the most technologically advanced materials and processes of the period – most notably in fibreglass-reinforced plastics. Following their researches in the 1940s and 1950s they were able to develop the sculptural and ergonomic possibilities of chair design demanded by the new architecture of glass curtain-walling and open planning. Chairs attained a liberated status as free-standing sculptures in space and light.

Exhibitions at the Museum of Modern Art (an institution central to the promotion of modern art, design and architecture) such as the Organic Design in Home Furnishings of 1940 were a crucial stimulus for Eames and Saarinen. Eames’s first experiments with the creation of a seat moulded from one unit which was coated with neoprene (a synthetic rubber) gradually evolved into a unit of reinforced fibreglass sitting on a wire base, as in the *DAR* (Dining Armchair) of 1950. Produced by Herman Miller from 1952–72, this chair transposed industrial techniques applied for the manufacture of car seats to furniture design.

Eero Saarinen endeavoured to produce a moulded pedestal (plastic) chair from one single, organic form – he wished to avoid the usual “jumble of legs”. Technical limitations meant he was only able to use metal pedestals with a synthetic coating beneath the fibreglass seat-shell. It was the Danish designer Verner Panton whose stacking chair of 1960–67 represented the first plastic chair formed from a single glass-fibre shell, again mass-produced by Herman Miller. This single chair with its graceful, cantilevered silhouette embraces the optimism of the present, and the future. Other experiments with plastic in Pop and space-age styles led to Panton’s *Plastic House* of 1960 and a circular television for Wega in 1963.

Brightly coloured plastic had become the material that characterised the modern anti-establishment values of youth and easy living, so beloved of the 1960s. New Italian designers embraced the new plastic materials – polyurethane foam, fibre-

glass, heat-shaped acrylic, polypropylene thermo-formed ABS, and welded PVC (polyvinylchloride). The *stile Italiana* of the 1960s created a new domestic landscape and plastics were at its centre producing playful furniture for the new democratic, consumerist society. Wit, colour, sensuality and irreverence broke with the puritanical traditions of northern Modernism and conventional good taste. De Pas, D’Urbino and Lomazzi’s *Blow* furniture made of inflatable, transparent PVC seating emphasised the cheeky, transitory qualities of the post-war world. Joe Colombo’s injection moulded four-legged stacking chairs such as *Model 4867* of 1965 were brash, light-weight, tough and highly popular. Vico Magistretti’s *Selene* chair of 1966 is still produced by Kartell. Archizoom’s *Superonda* of 1966 saw vinyl-covered polyurethane foam configurations enabling the user to define his own furniture shapes and living-spaces. Italian plastics, buoyed by economic and industrial development, broke new ground – technically, aesthetically and socially. They embodied freedom, fun and democratic principles for the post-war generation.

After the oil crisis of the 1970s the middle-class interior banished plastics to the impersonal hotel or office, or to the garden or patio. Patterned Formica (perhaps the most democratic of materials) was featured in Ettore Sottsass and Associates’ first Memphis collection, exhibited in Milan in 1981, thus re-establishing plastic at the heart of avant-garde furniture design. Here luxury living-room furniture combined kitsch and Neo-Classical elements in a range of brightly coloured and patterned laminates, usually associated with kitchens and bathrooms. The traditional hierarchy of furniture materials was undermined, with plastic as the medium. “A rich woman covered in gold.. can say that she has the best.. Instead”, Sottsass asserted, “Memphis was saying that you are the best if you have plastic laminate”. Memphis was trying to connect, with stylish irreverence, design and industry to the broader culture within which we live. Postmodernist Memphis style returned plastic furniture and surfaces to the leading edge of international interior design.

More recently Philippe Starck, Gaetano Pesce, Shiro Kuramata, Tom Dixon and other artist-designers have freely applied the vast possibilities of new plastic technology to their expressive and imaginative furniture pieces. Plastic materials are used alongside wood and metal, each transmitting the artistic aspirations of the new furniture, and a new generation of high performing plastics is slowing down the aging process and improving scratch-resistance and gloss. Pesce’s cast polyester resin tables, manufactured by Cassina, have surface-edges that are chipped by hand and he has recently realised the potential of the new polyurethane-based floor-material in the New York Chiat / Day offices where vibrantly coloured, poured plastic creates a floor-as-painting. Tom Dixon has used taltex rubber in works such as his *S* chair coated in lycra neoprene. Indisputably modern materials have been combined with categorically contemporary designs.

Plečnik, Jože 1872–1957

Slovenian architect and designer

Born in Labach (now Ljubljana), Slovenia, Jože Plečnik is now recognised as one of the most important European architects and interior designers of the first part of this century. He was apprenticed in his father's carpentry shop and trained as a furniture designer in Graz, then as an architect under the Secessionist architect, Otto Wagner in Vienna. Working in Vienna, Prague and Ljubljana, he developed a subtle but distinctive vocabulary, and created his own mixture of the archaic and the modern, that is not readily associated with 20th-century "classical" Modernism. He produced designs that were able, for a time, to represent a new cultural identity for the Slavic peoples. His interiors, including fittings and furnishings, ranged from apartments to major institutional buildings, and he also worked on several churches which were important as a means of expressing his religious beliefs.

Plečnik's early exposure to, and interest in, Northern Mannerism and Baroque, together with an emphasis on fantasy and organic decoration typical of those involved in the Secessionist movements of the 1890s, shaped his first designs. The ideas of Gottfried Semper which he became familiar with in Vienna also had a lasting influence. A Rome scholarship in 1898 gave him the opportunity to study antique and Renaissance classical sources, as well as the more rustic Mediterranean vernacular, in Italy. These appealed to him as representing another aspect of his cultural inheritance and

were increasingly important in his work. He later saw the Etruscans as direct ancestors of the Slovenian people, which encouraged the incorporation of such archaic forms as he considered appropriate for his version of a continuing tradition. Ljubljana was seen as a meeting point of Northern Europe and the Mediterranean world and Plečnik wished to express this in his work.

From 1901 to 1909 Plečnik was a member of the Vienna Secession, designing several exhibitions and exhibiting his own furniture, which he also showed in America at the 1904 St. Louis World's Fair. His work varied widely during this period, and includes some heavy, angular furniture in highly decorated interiors (Weidmann's Vienna apartment, 1902), typical elegant Secessionist furniture (chairs for Dr. Knauer, 1903) and some extremely modern designs (the waiting room in Dr. Pecham's apartment, 1905), similar to work by Josef Hoffmann. The Zacherl house of 1903–05 has an elliptical staircase whose form derived from an 18th-century example, but the metal balustrade is modern and the brass, abstract insect-like lamps are symbolic (Zacherl was a manufacturer of insecticide) – a typical Secessionist device. The entrance hall was simple and modern, mirror-lined with plain columns. From 1904 Plečnik moved towards a highly individual form of stripped-down classicism that incorporated more or less explicit historical references, and which he was to maintain for most of his life.

From 1911 to 1921 he lived in Prague and was much occupied with teaching. His next major interiors were a part of his restoration of Hradčany (Prague Castle) as a symbol of the new and democratic Czech Republic. This project included the apartments (1920–24) for the newly elected President, Thomas Masaryk, who, along with his daughter, was a great supporter of Plečnik's ideas. At Prague Castle Plečnik was able to draw on classical sources to create a new monumentalism and a subtle ordering of spaces and his interiors included a vaulted entrance hall with polished marble columns of Minoan derivation; a Roman-style impluvium with light, rather than rainwater, falling on a granite basin; corridors with niches containing classical vases or sculptures depicting Czech lions. New and old furniture and furnishings were combined: a Ladies' Salon had dark wood framing glass panels displaying Slovak needlework; a cloakroom was lined with smooth wood panelling topped with sculptured heads, some almost African in appearance; and 19th-century chandeliers and oriental carpets were interspersed with Plečnik's own simplified Biedermeier-style hardwood chairs and plain stone tables. All the furniture was carefully placed to form part of the architectural whole. The culmination of Plečnik's work on the interiors was the renovation of the Matthias Hall (now the Plečnik Room) of 1928–30, which had three tiers of plain stone columns lining the windowed walls above an arcaded ground floor, and a ceiling of copper which incorporated rivets that created a pattern of squares on its surface.

Despite the innovative style of his work in Prague, the Czech people were becoming increasingly hostile to his work and his Slovenian nationality, as had earlier been the case in Vienna, and in 1921 Plečnik moved back to Ljubljana. There followed a series of commissions up to World War II that enabled him to use his developing ideas in the service of his native country.

Plečnik: salon of the Prelovšek house, Ljubljana, 1931–33

The interior of the Chamber of Commerce, Crafts and Industry, of 1925–27, within an existing Neo-Renaissance building, was a more sumptuous version of the Prague Castle interiors using native Slovenian materials to showcase the country's applied arts. The staircase was particularly noteworthy. The walls were lined with marble, and the combination of polished surfaces, dark colours, gleaming metal lamps and sculptured columns, including Baroque-style "barley sugar" columns, produced a rich and mysterious effect. Plečnik used the columned staircase hall in other Ljubljana interiors such as the Vzajemna Insurance Building of 1928–30 and the later

National University Library of 1936–41 where the symbolic or Expressionist content is even more deliberate. Here the students were meant to rise from the darkness of ignorance, symbolised by the dark stone colonnade surrounding the straight stair from the ground floor, to the light of wisdom reached in the vast reading room above. As with all Plečnik's work, the quality and variety of the materials, and the detail of the applied decoration, indicate the importance of earlier craft traditions.

The interiors of his own house, which he altered from 1924 to 1930, show more restraint, with the ascetic side of his

nature evident in his monk-like bedroom. His interest in classical geometry is revealed in the circular extension he built to house a studio on the ground floor. For the house interior designed for Matko Prelovšek in 1931–33 Plečnik again drew on ideas used in Prague Castle, and other interiors. The library is panelled in wood with embroideries displayed behind glass above the bookshelves. A marble-columned arcade separates the dining area from the living room. The plain plastered walls contrast with the patterned polished wood floor, the dark coffered ceiling, the elegant but archaic, ebonised wood chairs and monumental dining table, cupboards and sideboards. While this room appears more conventional than the revolutionary interiors by contemporaries such as Frank Lloyd Wright or Charles Rennie Mackintosh, its subtle restraint and elegance are nonetheless very powerful. Strikingly individual touches are provided by the candlesticks, chandeliers and even ashtrays. And Plečnik's metalwork objects, which also included many items made for religious use, are of great interest, with a harsh, geometric but archaic feel, unlike the sweeter work of someone like C.R. Ashbee. Many of these objects are like miniature architectural designs, illustrating in microcosm Plečnik's originality in combining forms and materials in new ways with concern for craftsmanship and design.

In other domestic works of the 1930s, such as the Royal Hunting Lodge, Kamniska Bistrica, 1933–34, and the wooden lodges and summer houses he called *murke*, after a simple mountain flower, the style and furnishings are more in line with Plečnik's church interiors of the 1930s and later, such as St. Michael's, Barje. Here the influence of Slavic vernacular architecture and folk art, long of interest to Plečnik, becomes evident, in the form of carved and decorated woodwork. His post-war work consisted mainly of furnishings, and his style became increasingly decorative and rustic, although maintaining a strong element of abstraction, and always carefully made. A major commission was the furnishings for the Stelè family house in Kamnik (1945). Another important work was the conversion of the monastery of Krizanke in Ljubljana to a cultural centre in 1952–56 which shows Plečnik's success in combining the old and new in a lasting way, incorporating *sgraffito* designs based on folk art.

For much of his later life Plečnik was regarded as an anachronism but, with the emergence of Postmodernism and the increasing acceptance of work which did not follow strict Modernist precepts, interest in his designs has grown. His furniture and metalwork have influenced designers such as Boris Sipek, and a Slovenian furniture company is now producing pieces using Plečnik's designs.

DIANA HALE

Biography

Born in Laibach (now Ljubljana), formerly Yugoslavia, 23 January 1872, the son of a woodworker. Trained in his father's workshop; worked as a furniture designer from 1889; studied at the Kunstgewerbeschule, Graz, Austria, 1895–97; entered the studio of Otto Wagner, 1894; studied under Wagner at the Akademie der bildenden Künste, Vienna, 1895–98; awarded the Prix de Rome and travelled in Italy and France, 1898. Worked in Wagner's studio, 1899–1900; in private practice as an architect, Vienna, 1901–11; professor, School of Applied Arts, Prague, 1911–21; returned to Ljubljana, 1921; professor of architecture, Polytechnical School,

Ljubljana, and practising architect and designer, 1921–56. Awarded gold medal, St. Louis World's Fair, 1904. Died in Ljubljana, 1957.

Selected Collections

The Plečnik archives, containing designs, drawings, furnishings, photographs and correspondence, are preserved in Plečnik's house, now the Museum of Architecture, Ljubljana; the museum also contains reconstructions of Plečnik's bedroom, living room and studio.

Interiors

- 1902 Langer House, Hietzing, Vienna (façade and interior alterations): Karl Langer
- 1903–05 Zacherl House, Vienna (building, interiors and furnishings)
- 1904 World's Fair, St. Louis (Salon interior and furnishings)
- 1921–35 Prague Castle (restoration, additions, courtyards and gardens; interiors and furniture)
- 1924–30 Plečnik's House, Ljubljana (additions, interiors and furnishings)
- 1925–27 Chamber of Commerce, Craft and Industry, Ljubljana (building, interiors and furnishings)
- 1928–30 Headquarters of the Vzajemna Insurance Company, Ljubljana (building and interiors)
- 1931–33 Prelovšek House, Ljubljana (interiors and furnishings)
- 1936–41 National University Library, Ljubljana (building, interiors and furnishings)
- 1952–56 Krizanke Monastery (Monastery of the German Knights), Ljubljana (restoration and interiors)

Plywood Furniture

Although plywood is typically seen as a 20th-century material with distinctly “modern” connotations, examples of the use of laminated veneers, in both flat and bent (or, more commonly, *moulded*) forms, can be found dating from as early as the mid 18th century. However, it was probably Michael Thonet (1796–1871) who was the first to use laminated veneers in any substantial way in the manufacture of furniture. Although he was subsequently to pioneer a process of bending solid wood through the use of steam, Thonet’s first experiments in the 1830s consisted of soaking thin strips of veneer in heated glue, then binding several together around cast-iron formers. Once dry, these curved pieces were jointed together and veneered, obscuring to some extent the innovative nature of their construction. Despite the Biedermeier style of their design, Thonet’s curved profile chairs could not have been produced satisfactorily by conventional methods, and, although they lacked the “springiness” of his famous bentwood furniture, they clearly made it a possibility. Across the Atlantic in the 1840s, John Henry Belter found that he could produce curved chair backs from several sheets of veneer, glued together and clamped between heated “cauls”. While some of Belter’s designs feature relatively plain expanses of moulded plywood, most were pierced and carved into the ornate Rococo patterns then in vogue.

Despite these important early experiments, the history of ply- and laminated-wood furniture before the late 19th century is one of unconnected episodes, none of which found an aesthetic that truly reflected the modernity of their innovative processes. Predictably enough, the earliest furniture that did not disguise the use of plywood was cheap institutional seating. W. Gardner, who was among the first to patent the material in the United States in the 1870s, manufactured moulded plywood seats for railway stations and hospitals. And, from the 1890s onwards, the Estonia-based Luterma company manufactured similar seats for trams. By the beginning of the 20th century, plywood was generally regarded as a cheap and inferior substitute for solid wood, being used most commonly in the production of domestic furniture for mirror backs, drawer bottoms, etc.

During World War I, demand for plywood increased, its lightness and strength proving ideal in the production of airplanes. Plywood manufacturing technology inevitably improved as a consequence, and its use in the aircraft industry also endowed the material with connotations of modernity. This, as well as its capacity for being formed into curves, located it on the Modernist palette, alongside tubular steel and reinforced concrete. Of those Modernist designers who experimented successfully with moulded plywood in the inter-war period, the most significant was the Finnish architect Alvar Aalto. Having recognised plywood’s potential for inexpensive, mass-produced furniture, Aalto developed a vocabulary of moulded plywood seat forms supported on laminated wood “legs”. Of these, the *Paimio* chair (1932) is perhaps the best known. Designed, like most of his furniture, for a specific interior – in this case the Paimio Sanatorium – the chair illustrates the state-of-the-art plywood technology at this time. Several thin sheets of birch veneer were heated to make them pliable, then coated with adhesive and layered-up with the grain of

each running at right angles to the adjacent ones. This “sandwich” was then pressed between moulds of the required shape until the adhesive had set.

Aalto’s ply- and laminated-wood furniture was to prove extremely influential, raising the profile of the material, and spawning a number of other plywood furniture enterprises. These included Gerald Summers’s Makers of Simple Furniture and Plan, which manufactured designs by Serge Chermayeff. The most significant and direct response to Aalto’s work, however, came from the Isokon company, for which Marcel Breuer designed a number of pieces including the iconic *Long Chair* (1936) – a chaise-longue, the seat and back of which consists of a single sheet of moulded plywood, supported on laminated-wood leg forms.

Throughout the 1940s, Breuer also designed a number of chairs reliant on cut-out rather than moulded plywood. Most consisted of two identical side profiles cut from a flat sheet of plywood, with a seat and back suspended between them. While this might seem a somewhat simplistic approach given Breuer’s experimentation with moulded plywood, it is symptomatic of his desire to reduce the cost and complexity of chair manufacture, and to find forms appropriate for the rediscovered material. As he explained: “It is ... possible to cut out plywood in free forms ... without sacrificing its strength. It won’t split under the stress, as wood will in this case.” While there was obviously scope for a wide variety of free forms, the aesthetic effect was always similar, and the chairs often had a rather unrefined box-like appearance.

Aalto’s furniture, and the contemporaneous designs by Breuer, Summers, Chermayeff and others, represented for many a more acceptable Modernism than that offered by the arguably austere tubular steel designs of Mart Stam, Mies van der Rohe and Breuer himself. Although equally free of ornament, the use of a traditional and somehow more natural material made modern design more palatable, especially in Scandinavia and Britain.

In all of Aalto’s and Breuer’s moulded plywood designs, the material is bent in only one plane: the production of compound curves in plywood (sometimes called double-curved plywood) had proved elusive, despite experimentation by a number of designers, including Walter Gropius. However, in their winning entry to the Museum of Modern Art’s 1940 Organic Design in Home Furnishings competition, Charles Eames and Eero Saarinen succeeded in moulding a single sheet of plywood into different directions, on different planes, at the same time.

Production of Eames and Saarinen’s seminal designs was shelved as a result of the war, although, ironically, the war itself was to prove a catalyst for technological development: investment on the part of the US Navy allowed Charles Eames and his wife Ray to develop their plywood moulding techniques for the production of leg splints, stretchers and glider shells. The Eameses were then able to produce a series of prototype chairs, the production versions of which were shown at the Museum of Modern Art in 1946. In the best known model, the *DCM*, the seat and back are independent double-curved elements supported through rubber shock mounts on steel legs. The production of compound curves was made possible through the development of stronger adhesives and a process whereby layered veneers were pressed over a single form with a pressurised bag. The separation of the various

Plywood furniture by Charles Eames, 1947

elements was fundamental to the Eameses' organic aesthetic which consciously rejected the rectilinear geometry of contemporary architecture. And, whereas Aalto's use of applied colour had been limited to black, white and one or two muted colours, the Eameses' chairs were often stained in bright primary colours.

The moulding and bonding techniques developed by the Eameses were embraced wholeheartedly by the furniture industry, and are today standard processes used by a great many manufacturers. Their furniture was also extremely influential for a whole generation of designers, both in terms of the manufacturing processes employed, and the organic aesthetic it promoted. Of particular note is the Danish designer Arne Jacobsen, whose remarkably successful *3107* (1957) and *Ant* (1953) chairs further refined the joining of metal legs to a plywood shell.

Once shunned, plywood and laminated wood are now accepted elements of the 20th century interior. Their use in the domestic sector has even been promoted through retailers such

as IKEA, although it is probably now in the commercial sector that they find their widest application.

Pompeian Style

The dramatic discoveries of the lost Roman cities of Herculaneum from 1738 and Pompeii from 1748 onwards – buried by an eruption of Mount Vesuvius in AD 79 – inspired a succession of experiments in the design of interiors and furnishings as well as in other areas of Neo-Classical art. While the most creative phase of this generically termed Pompeian Style occurred during the second half of the 18th century, some of its origins can be traced back to earlier attempts to revive antique decorative painting during the Italian Renaissance.

The discovery around 1500 of some surviving painted interiors from Nero's Golden House in Rome prompted the first attempts to revive antique decoration with the Vatican loggie and Villa Madama by Raphael and his followers. Through Mannerist designers, such as Giulio Romano and the artists of the School of Fontainebleau, the resulting Grotesque mode of decoration entered the European ornamental vocabulary, and was first introduced to England by William Kent during the 1720s (Kensington Palace, London, 1723; Rousham House, Oxfordshire, 1738–41).

While this Grotesque style was to become inextricably bound up with the early essays in interior decoration inspired by the Neapolitan finds, the impact of the latter discoveries was slow to take effect. Apart from random illustrations in early accounts, images of the principal finds were only widely available from 1757 when the first volume (devoted to painting) of the official publication, *Le Antichità di Ercolano esposti*, was issued by the Accademia Ercolanese, established by Charles III. Given previous restrictions on sketching as well as the severe physical constraints of Herculaneum's underground site, the *scavi* gave little idea of entire room schemes or their furnishings (apart from a few bronze and marble objects) and led to a series of particularly imaginative experiments by a succession of British designers during the 1760s and 1770s.

One of the earliest attempts to recreate an interior in the antique taste was James Stuart's Painted Room in Spencer House, London (from 1759), which involved a mixture of Grotesque ornament, painted panels after Herculaneum compositions and motifs drawn from a wide range of classical sources, including Greece. This room was originally enhanced by an exceptional suite of archaeologically-inspired furniture (partly removed later to Althorp House, Northamptonshire) including a pair of gilt-bronze tripod perfume burners on

wooden pedestals painted to accord with the wall decoration, and four gilt-wood sofas with winged-lion ends, partly derived from Roman marble benches. During the 1760s the Adam brothers, in conscious rivalry with Stuart, were quick to develop various types of painted interiors *al antica* at Kedleston Hall, Derbyshire (1760–68), Audley End, Essex (1763), and Syon House, Middlesex (1764).

In 1772 a fresh challenge was provided by James Wyatt, who produced a delicately executed system of painted decoration with furniture to match in the Cupola Room at Heaton Hall, Lancashire. During this period Wyatt also introduced the ingenious Etruscan Style, exploiting ornaments, figures and colours primarily derived from antique vase paintings, which was to be taken over by the Adams for a series of interiors during the 1770s, exemplified by the Etruscan Dressing Room, Osterley Park, Middlesex (c.1775–76). Here the painted wall areas were embellished with a system of fictive trellis constructions based on Pompeian sources and set off by vase motifs largely derived from Wedgwood. This setting was skilfully co-ordinated with chairs and other painted furniture, including a pole-screen, together with its ceiling and matching carpet (the latter no longer extant) to achieve an exceptional unity of contemporary design.

This aspect of the Pompeian Revival, which was continued into the 1780s by the Adams, Wyatt and their imitators, was introduced into the Louis XVI style by Charles-Louis Clérisseau in salons for two houses for Laurent Grimod de la Reynière in Paris (1773–74 and 1780–82 respectively). However, by then, new perspectives on Roman antiquity were being revealed, as the focus of excavations shifted from Herculaneum to Pompeii. The more accessible character of Pompeii, and the greater ease of removing volcanic ash, allowed considerable areas of houses to be explored *in situ* for the first time. These fresh developments promoted a new interest in documenting and publishing antique painted interiors as well as reconstructing complete schemes from the evidence now appearing.

By the later 1770s the Society of Antiquaries of London was receiving regular accounts from Sir William Hamilton, often accompanied by coloured sketches, of total painted schemes uncovered at Pompeii. The impact of this new material was to be demonstrated at Packington Hall, Warwickshire, where the 4th Earl of Aylesford between 1785 and 1788 produced the first fully-fledged Pompeian interior in Europe, anticipating by over half a century the more archaeological reconstructions in Germany and France. Assisted by the architect Joseph Bonomi and a team of craftsmen and decorators led by the painter J.F. Rigaud, Aylesford created an interior following the spirit rather than the letter of Third Style Pompeian wall compositions. In particular, historic methods of encaustic painting were used to devise a colour scheme involving strong reds, combined with black and gold. This was extended to the curtains as well as to the upholstery of a particularly early set of *klismos* chairs.

With the French occupation of Italy during the early 19th century, a fresh impetus was given to excavations at Pompeii as well as by the Empire taste for the sumptuous and richly ornate, reflected in the interior designs of Percier and Fontaine (see their *Recueil de décorations intérieures* of 1801). Some two decades previously, the Scottish architect Charles Cameron, working for Catherine II of Russia at Tsarskoe Selo

Pompeian Style: design for vestibule for Maison Pompéienne, Paris; gouache by Alfred Normand, 1856

in the 1780s, had already anticipated this heavy opulence, using agate, lapis and other semi-precious materials. British designers of the Regency era also valued the rich tonality of Pompeian schemes, as reflected in the London house (c.1800) of the arbiter and designer Thomas Hope, who used vivid colour schemes to set off furniture that he had based on antique prototypes.

However, it was in Germany, and later in France, that the most ambitious Pompeian interiors were created during the first half of the 19th century. Karl Friedrich Schinkel designed a Pompeian tea salon for the Crown Prince, later Friedrich William IV in Schloss Charlottenburg, Berlin (1825–26). A far greater degree of archaeological fidelity was to be shown in the elaborate Pompeianum at Aschaffenburg by Friedrich von Gärtner for Ludwig I (1841–46), imitating the House of Castor and Pollux at Pompeii.

In France, meanwhile, Alfred Normand created an exact but somewhat lifeless Pompeian interior for Prince Napoleon's Parisian house in 1854–59 (this lost work is recorded in a salon piece of 1861 by G. Boulanger). In Victorian England, on the other hand, the Pompeian Style proved of less appeal, despite the literary success of Edward Bulwer Lytton's novel *The Last Days of Pompeii* (1834). In 1838 Prince Albert commissioned a room in this taste from Agostino Aglio for a garden pavilion at Buckingham Palace (1843–45; destroyed in 1928). A particularly late flowering of the style can be seen in the Roman Room at Ickworth House, Suffolk, produced by

J.D. Crace in 1879, which closely followed the authentic decorations discovered at the Villa Negroni, Rome. By this time, however, the style had already lost momentum, apart from the sets of Hollywood epics and the celluloid fantasies of Fellini. The 1970s saw the totally unexpected phenomenon of the scholarly reconstruction in California of the Villa of the Papyri, Herculaneum (excavated by Karl Weber between 1750 and 1765), in John Paul Getty's lavish museum at Malibu, designed by the architectural firm Langdon and Wilson, and completed in 1974.

Ponti, Gio 1891-1979

Italian architect, interior and industrial designer

Gio Ponti was the grand master of Italian Modernism. A multi-talented figure, he transferred his skills across several media and continents, touching each with a life-affirming spirit which he happily associated with an Italian style of living. His architecture encompassed holiday houses, office buildings, cathedrals, ships and skyscrapers. His interiors included furniture, frescoes, lighting and ceramics and often incorporated the skills of talented Italian artists and craftsmen. He was an inspiring teacher, writer and editor, and founded *Domus*, the influential art and design magazine, which he edited (with a six-month break) until his death. In its first editorial (January 1928), he asserted that the Italian house was not simply a shelter from the elements or "a machine for living in", it was also "a setting for Italian life", and this humanistic approach to architecture and interiors was evident in all his work. Above all, it is Ponti's enthusiasm for the mingling of beauty, tradition and modernity which has been so inspirational to 20th-century designers and Italian designers in particular. He desired an architecture "glowing with imagination and full of human comprehension".

Ponti's career began in the decades immediately following the end of World War I. After serving as a captain in the Engineers Corps from 1916 to 1918, he graduated as an architect at Milan Polytechnic in 1921. But his earliest major success came as a designer and art director of the Richard Ginori porcelain factory where he transformed the company's production, decorating fine porcelain with 1920s Neo-Classical architecture and nudes, and winning the Grand Prix at the Paris Exposition of 1925. He combined fine art and

decoration with factory-production methods to create a "moderne" Italianate product.

Ponti's early buildings and interiors also have distinct Neo-Classical overtones; this style enjoyed considerable popularity among progressive Italian architects during the 1920s and 1930s. In addition, however, Ponti was a great admirer of contemporary French design and the applied arts of the Austrian Wiener Werkstätte. These influences are apparent in the house designed for Christoffe, outside Paris, in 1926, and in the Holiday House exhibited at the 4th Monza Biennale, in 1930. Appointed a director of the second Monza Biennale, an international design fair, Ponti was subsequently instrumental in moving it to Milan in 1933 where it became the influential Milan Triennale.

During the 1930s, Ponti was commissioned to design several private houses, and the building and fittings for the major chemicals business, the Montecatini company. He was also active as a designer of furnishings. In the spring of 1933, he was appointed art director of the glass and lighting manufacturer Fontane Arte and created numerous large and small pieces ranging from dressing-tables in curved and coloured crystal to Deco-style wall mirrors and paperweights. The walnut furniture for the Schejola apartment in Milan (1929), by contrast, displays a Neo-Classical lightness and fine profile. The country house for Tony H. Bouilhet at Garches, Paris (1926), with its Palladian detailing and painted ceiling over the hall, has a grand staircase of the sort that Ponti particularly liked. And his interiors of the Fürstenberg Palace, Vienna (1936), and the Office of the Chairman of the Ferrania Company, Rome (1936), reveal his enduring admiration for Viennese precedents. The Rome commission, in particular, features a unified, yet boldly striped interior reminiscent of the work of Josef Hoffmann.

Not surprisingly, many of Ponti's enthusiasms were highlighted in the pages of *Domus* magazine. He used his position as editor to introduce the work of the Wiener Werkstätte and current debates in architecture and design to his fellow countrymen and to promote Italian products and styles to the magazine's wide international audience. For much of his life he was also a great admirer of Italian artisan traditions. He drew on these traditions in the manufacture of his own furniture and saw them as the basis for Italian industrial production. And increasingly *Domus* became a vehicle for his belief in the importance of combining personal expression with native traditions and for expressing his admiration for recent developments in American and European art and design. These ranged from the furniture of Charles Eames to the paintings of Picasso and Jackson Pollock.

Several elements of Ponti's interior design style appear in his own house at Casa Laporte, Milan (1936). This house has a large, open-plan, two-storeyed, central living room that faces a winter-garden and enjoys the benefits of copious natural light, spaciousness and multiple views. The roof terrace, described as "a room with the sky for a ceiling", was for sunbathing and relaxation. Every room had built-in bookcases, and another interior for the Vansetti house, Milan (1938), features one of Ponti's "organised walls", consisting of a wooden, latticed structure covering the whole wall that includes bookshelves, a bar and recesses for glass and ceramic ornaments.

Ponti's love of the Mediterranean inspired one of his

Ponti: Villa Arreaza, Caracas, 1956

favourite themes – “the house by the sea” – and examples include the Villa Marchesano, Bordighera of 1938, and the Case a Capo Perla, Elba, of 1962. White walls, porthole views through to internal courtyards, and brightly coloured, custom-designed tiled floors and ceramic-tiled swimming pools were used to create joyous buildings in which to enjoy the *dolce vita* or good life. Several designs for these houses were featured in *Domus* where they were described as “theatres for human figures; the coloured tile flooring is the scenery”. At the Villa Donegani, Bordighera (1939), the two-storeyed central living room has another of his grand staircases, and throughout the villa he uses sliding doors. Circular “cut-out” windows alternate with rectangles; none have frames, but all have window boxes. The walls are painted sun-reflecting white, the awnings are bright blue and there is colourful maiolica tiling in the solarium. Ponti’s interest in creating private and communal spaces also surfaces in the hotels that he designed with Rudofsky at Capri and Antibes. Thus, the swimming pool at

the Hotel Royal, San Remo has shaped niches where each bather can enjoy some privacy within the pool.

The Villa Planchart, Caracas, Venezuela, built for Anala and Armando Planchart in 1955, is a masterpiece of privileged, private living where a sumptuous visual experience inspires daily life. Set on a hill and surrounded by a tropical garden, the house was conceived as a giant abstract sculpture and was designed to be seen from the inside. An open patio encircles the bedroom, a double-height living room, studio, library and kitchen. The walls appear to be detached and weightless, suspended like curtains. Surfaces, such as walls, doors, ceilings, and marble floors, are toned and patterned in neutral yellows, greys and silver blues. Ceramic sculpture and tiled decorations by Fausto Melotti decorate the patio and stair-walls. A “Florentine Villa” transposed to South America, its colourful, luminous and tranquil atmosphere evokes the “relaxing visions of peace needed for the recreation of our spirit”.

In 1956, at the pinnacle of his career, Ponti completed the

Pirelli Tower, an “emblem of modern Milan”. The 1950s also marked the beginnings of his collaboration with the decorator / designer, Piero Fornasetti, with whom he worked on several interior schemes. In Ponti’s Casino rooms at San Remo, for example, Fornasetti’s printed playing-cards are “scattered” across armchairs, curtains, ceilings and walls, while the furnishings in the Vembi-Burroughs offices in Genoa and Turin include coverings decorated with Fornasetti’s *trompe-l’oeil* stationery and computers. Ponti declared that “A degree of amusement should not be excluded from interior decoration it is an old tradition”. Fornasetti’s witty, almost Surreal designs were clearly well-suited to this view, and a phantasmogoria of his printed classical borrowings cascade over the partitions and painted mirror-doors in a Milan apartment of 1951. Ponti also collaborated with Luigi Grampa, the founder of the Jsa fabric factory for which Ponti designed textiles between 1950 and 1958.

Ponti is also renowned as a designer of modern chairs. Some of his most celebrated designs were produced by the furniture manufacturer Cassina, including the 1937 *Lotus* armchair and the stylish, upholstered *Distex* armchair with its elegant “Italian” line and spiky, angled legs of 1953. The *Superleggera* chair of 1955 (produced by Cassina since 1957) achieves a unique fusion of beauty and functionalism and this deceptively modest dining chair has remained an icon of modern Italian design. Ponti is indebted to the craft traditions of the fishing village of Chiavari, especially in the chair’s cane seat and its construction techniques. The frame is made of well-seasoned ashwood, ebonised or natural, the front legs are tapered and those at the rear are lightly bent. His aim was to produce a chair that would be light yet strong, modern yet classic, and traditional yet natural. The original version could be lifted with one finger and was comparatively inexpensive. A stronger, more exclusive version was made of white lacquered wood and had a silk seat decorated with a linear pattern featuring engraved butterflies.

As Ponti’s confidence as a designer grew he branched out into other areas including products such as the *La Pavoni* espresso coffee-machine (1949) and his much admired range of sanitary fittings designed for Ideal Standard, Milan, which combine organic elegance with modern lines. His ingenuity is also demonstrated in his bed-head dashboard of 1953, and his “furnished window” and one-room accommodation of 1954. His progressive approach to new materials and technologies is revealed in office interiors such as the Pirelli building, the Montecatini offices, and his own Via Dezza studios in Milan (1952). He designed all the furnishings for the first Montecatini building in 1936 with desks made of sheet steel, chairs of tubular steel, and aluminium alloy window-frames. His Milan studio had no partitions, and its open, shed-like interior with stylish overhead lighting prefigured the High-Tech workshops of the 1970s and 1980s.

Ponti promoted a rich synthesis of Italian traditions and a commitment to international Modernism with humour and grace. His achievements were closely linked to his Italian heritage and his own view of his talents was summarized in the phrase: “Being Italian is enough”.

Biography

Born in Milan, 18 November 1891. Studied architecture at the Politecnico di Milan, 1918–21. Served as a captain in the Italian army, 1916–18; awarded bronze medal and Military Cross. Married Giulia Vimercati, 1921: 4 children. Worked in the architectural studio of Mino Fiocchi and Emilio Lancia, Milan, 1921; designer and product renovator for the ceramics manufacturer Richard Ginori, Milan and Florence, 1923–30; partner, with Lancia, in Studio Ponti e Lancia architectural practice, Milan, 1927–33; in partnership with architects Antonio Fornaroli and Eugenio Soncini in Studio Ponti / Fornaroli / Soncini, Milan, 1952–76. Students included Piero Fornasetti (1923–88). Designed ceramics, furniture, interiors, textiles and lighting from the mid-1920s; supplied designs for numerous firms including La Visa, Argenteria Krupp, Gallieni, Nordiska Kompaniet, Christofle, Kima, Cassina, Ideal Standard, Arredoluce and Knoll. Founded *Domus* magazine, Milan, 1928: editor, 1928–41, 1948–79. Founded *Stile* magazine, Milan, 1941–47. Executive director, Monza Biennale, subsequently Milan Triennale, 1933–79; general supervisor Italia 61, Turin, 1961, and Eurodomus exhibitions, 1966–69. Professor of architecture, Politecnico di Milan, 1936–61. Received numerous awards including: Compasso d’Oro, Milan, 1956; Academia d’Architecture Gold Medal, Paris, 1968; Honorary Doctorate, Royal College of Art, London, 1958. Corresponding Member, Royal Institute of British Architects; honorary associate, American Institute of Architects; member, Accademia di San Luca. Died in Milan, 16 September 1979.

Selected Works

A collection of Ponti’s designs and drawings is in the Centro Studi e Archivio della Comunicazione, University of Padua, which also has the entire set of documents previously belonging to the Ponti Studio. Examples of Ponti’s furniture are in the Museo della Scala, Milan, the Brooklyn Museum and the Metropolitan Museum of Art, New York, and the Vitra Design Museum, Weil-am-Rhein. Examples of Ponti’s ceramics are in the Museo delle Porcellane di Doccia, Florence. For a full list of Ponti’s architectural and design commissions see Licitra Ponti 1990.

- 1963 Daniel Koo Villa, Hong Kong

Ponti designed numerous items of furniture, ceramics, textiles, flatware, lighting, silverware, glass, and sanitary fittings. His clients included: pottery and porcelain for Richard Ginori, Milan, 1923–30; cutlery and silverware for Christofle, Paris, from 1927; glassware for Venini, Murano, from 1927; crystal for Fontana, Milan, from 1930; silks for Vittorio Ferrari, Milan, from 1930; flatware for Krupp Italiana, Milan, from 1930; espresso coffee machines for La Pavoni, Milan, 1948; sanitary fixtures for Ideal Standard, Milan, 1953; textiles for Jsa, Varese, from 1954. His clients for furniture included Arflex, Cassina, Singer, La Rinascente, Knoll International, and the Nordiska Kompaniet. Furniture included *Leggera* chair (1952), *Distex* armchair (1953), *Superleggera* chair (1955) and *Armchair 1215* (1964).

Pop Art and Design

Pop Art was a term coined during 1962 to describe a new and vibrant style in painting and sculpture. The style flourished during the 1960s in Europe and America as a direct result of the explosion in the mass media and a revolution in cultural attitudes. Images from advertising, Hollywood and pop music were, for the first time, celebrated in fine art. The trashy, the kitsch, the expendable entered the world of high culture. Pop Design also flourished during the 1960s as a direct result of this new cultural ambience and embodied a crucial challenge to the dominance of Modern design and the Good Design Movement. Interiors were created specifically for the younger generation in the form of boutiques and coffee bars. Fun furniture was manufactured from paper and interiors decorated with fake leopard-skin or painted with psychedelic graphics. Pop Design furnished the post-war teenager with a distinct, visual identity.

The roots of Pop Art lay in the work of Modern Movement artists, particularly the Cubists, Dadaists and Surrealists who used mass media images in their collages during the inter-war years. In Surrealist art incongruous objects were juxtaposed in disturbing explorations of the human subconscious. The work of the Dada artist, Kurt Schwitters, influenced the Independent Group in London. The Group are frequently, if questionably, cited as the "Fathers of Pop". Their informal meetings at the Institute of Contemporary Arts (ICA) during 1952–55 dealt with issues of mass culture and fine art, but they dealt with much more beside, including a reworking of Modernism. Members included the architects Alison and Peter Smithson, Colin St. John Wilson and James Stirling. Artist members, who went on to produce many important Pop Art images during their careers, were Richard Hamilton and Eduardo Paolozzi. Art / design critics Lawrence Alloway, Reyner Banham and John McHale were also key participants in Independent Group activities. This consisted largely of frequent, informal meetings to discuss important themes in modern art, advertising, film, interior design and fashion. The Independent Group also organised two important exhibitions around the theme of mass culture and high art. *Parallel of Life and Art* (1953) and *Man, Machine and Motion* (1955), both held at the ICA, which consisted of total environments using enlarged photographic images taken from newspapers and magazines.

Although the Independent Group ceased to meet in 1955, the erstwhile members contributed extensively towards the exhibition, *This is Tomorrow*, held at the Whitechapel Art Gallery in 1956. This consisted of twelve environments, each created by a team of three consisting of architect, sculptor and painter. Richard Hamilton created the collage, *Just What Is It That Makes Today's Homes So Different, So Appealing?* as a poster for the exhibition and illustration in the catalogue. This provocative image details every aspect of living in mid-20th century Britain which Hamilton and the Independent Group found so exhilarating. The interior featured a television, cinema, reel-to-reel tape recorder, vacuum cleaner and telephone. The images were taken from American glossy magazine advertisements which Hamilton and the Independent Group collected avidly.

In terms of interior design, Alison and Peter Smithson created one of the earliest Pop environments in March 1956

Pop: paper chair by Peter Murdoch, 1968

with their House of the Future, designed for the *Daily Mail's* Ideal Home Exhibition. The plastic impregnated fibrous plaster shell contained organically-shaped rooms, arranged around a central patio which provided daylight. Based on car styling, the compact house was trimmed with a chromium strip around its exterior. Inside many new gadgets were incorporated into the design, including an "Electro-static dust collector" and provision was made in the kitchen only for the cooking of frozen, convenience foods. The house was designed to be expendable. It could be traded in when the family outgrew the dwelling or simply grew tired of the style. It was this notion of the expendable aesthetic that distinguished Pop Design from its immediate predecessor, Modernism. While Le Corbusier or Mies van der Rohe designed interiors to last indefinitely as functional, design classics, Pop Design prided itself on being fashionable and expendable.

The theoretical foundations of Pop Art and Design were therefore laid in Britain during the 1950s by the Independent Group. At the same time Pop Art developed in the United States as a painting style and reaction to Abstract Expressionism. Robert Rauschenberg's *Bed* (1955) and Jasper Johns's *Flag* series of the 1950s celebrated the mundane in paint. This fed into the creation of Pop Art in the early 1960s, when the work of Andy Warhol and Roy Lichtenstein revelled in images from packaging and comic books, executed using printmaking techniques. In London, the Young Contemporaries exhibition at the Whitechapel Art Gallery in 1961 made a huge impact. This emerging generation of Pop painters were all trained at the Royal College of Art and included David Hockney, Allen Jones, Derek Boshier, Peter Phillips and Patrick Caulfield. Pop Art from both America and Britain was bold, brash and witty. The colours were vivid and flat, the forms heavily outlined. Whether it was cars, cigarette packets or Coca-Cola bottles, the paintings heralded the new

cultural ambience of the 1960s. Hedonistic fashion, futuristic admiration for new materials and a general spirit of playfulness prevailed. Pop Design for the interior was also a key aspect of the decade. The concept of expendability, as first proposed by the Independent Group and the Smithsons, found resonance. Design became fun. It adopted the wit and levity of Pop Art.

The classic example of the expendability of Pop Design is the disposable, paper chair. The British designer Peter Murdoch introduced the paper chair in 1964. The chair was stamped out of laminated card, scored and printed with bright polka-dots in one piece. They were designed to last only three to six months, and this deliberate expendability was a major departure from average family expectations, whereby a traditional three-piece suite was bought upon marriage and lasted a lifetime. Such expendable items of Pop Design were created primarily for the new, youth market. A new type of consumer had emerged during the later 1950s: the teenager, who began in America and made an impact throughout Europe by means of advertising, consumer goods and film. A report commissioned by a London advertising agency in 1959 estimated the spending power of the teenage sector in Britain during 1958 to be £900 million. The result was a new market sector that craved a distinct identity, different from that of the older generation. Before the 1950s young people had unquestioningly adopted the style and fashion of their elders. Now young consumers wished to express their own identity through distinct clothing, music and interiors. Thus the Pop interior was born.

Interior design was affected, in that new types of public space had to be styled which had never existed before. In Britain the coffee bar of the 1950s was the meeting place for the new teenager. These were generally run by first-generation Italians, and their cramped interiors usually featured a coffee machine prominently displayed on the counter. The classic example of the espresso coffee machine was designed by Gio Ponti for Gaggia in 1949. Young British designer Douglas Fisher designed the interiors of *The Gondola* in Wigmore Street and the *Mocomba* and *El Cubano* in Brompton Road for the youth market. Lightweight tables were covered in garish plastic laminate with aluminium trim and had popular, Contemporary Style chairs. An Alpine motif was frequently added with walls faced in stone or hung with stone-effect wallpaper. The central focus was the jukebox, the all-American icon with the Wurlitzer model based on the chromium plating, wrap-around screen and tail-lights of the American car.

A key example of the Pop interior, designed specifically for the teenager, was the boutique. One of the first examples in London was *Bazaar*, opened by young fashion designer Mary Quant in collaboration with Archie McNair and Alexander Plunket Greene in King's Road, Chelsea in November 1955. In 1957 John Stephen opened the first menswear boutique in Carnaby Street, which was to flourish into a teenage shopper's paradise during the 1960s. Boutiques were decorated with visual devices borrowed from Pop Art, including blown-up advertising images, bright colours and undulating shapes. The influence of Op Art was also obvious in the design of boutiques as well as the television graphics and set designs for youth programmes such as *Ready, Steady, Go!* Op, as exemplified by British artist Bridget Riley, consisted of linear

Pop: *Hecuba* vinyl wallpaper, designed by David Bartle for Sanderson's *Palladio 8* collection, 1968

patterns created to provide optical illusions of movement or depth. Most frequently executed in black and white, the impact of this style was seen in the adoption of targets and bull's eyes for the decoration of interiors and as logos, as for example, the Biba clothes store. Biba was the most successful of the Pop interiors, exploiting Op and Revivalist idioms.

The first Biba boutique opened in Abingdon Road, Kensington in 1964 to provide the young consumer with cheap, fashionable clothing. Barbara Hulanicki was the designer of the merchandise and the interiors. At Abingdon Road she retained many of the original, Victorian features to create a mysterious and magical atmosphere with dim lighting, dark blue walls with matching Morris print curtains, potted palms and loud music, while the clothing was hung on Victorian, bentwood hatstands. This introduces another key aspect of Pop Design, the revival of Victorian and Edwardian style at a time when modern design only looked forward and antique collectors did not look beyond the 18th century. Hulanicki plundered the past in her romantic interiors. In 1966 Biba moved to larger premises in Kensington Church Street where the windows were painted black with an Art Nouveau-inspired Biba logo in gold. With the next move to larger premises in Kensington High Street in 1969, Hulanicki employed an Art Deco influence, spraying the Egyptian-inspired decoration at the tops of the pillars gold. Art Deco glamour provided the inspiration for the last of the Biba stores in 1973, at the Derry and Toms building on Kensington High Street, built in 1933. The interior was designed by Whitmore-

Thomas with the help of the John Grasemark Film design studio. Pop Art provided the inspiration for the basement, where groceries could be bought – tins of baked beans were housed in giant, mock bean tins. The ground floor housed the Casbah in one corner, selling exotic brass and other objects from the Near East. In the centre was the mirrored boot and shoe counter. An escalator carried customers to the women's clothing department on the first floor, decorated with the familiar hatstands and potted palms. Above this was the maternity and children's wear, the third floor was used for menswear and the fourth for household goods. Prints, wallpapers, furniture and even black and gold Art Deco bread bins could be bought to recreate the Biba atmosphere in your own home. On the top floor was the Rainbow Room, restored to its original elegance with peach mirrors and concealed lighting. The store was like a hotel rather than a shop, and only 90,000 of the available 200,000 square feet was utilised. It was a fantastic place to visit and be seen in but not commercially viable, closing in 1975.

The boutique interior influenced the decoration of bedrooms and teenage bedrooms throughout the 1960s. British interior designers David Hicks, Michael Inchbald and Jon Bannenberg created daring interiors for more upmarket clients by mixing modern and antique furniture and by contrasting strong colours and surface patterns. Leading British interior designer Max Clendinning created powerful room sets using strong, single colours. His design for a living area was published in the *Daily Telegraph* in 1968 and consisted of smooth, integrated solids for tables, seating and storage space inspired by recent space travel. In France the designer Olivier Mourgue created science-fiction sets for the film *2001: A Space Odyssey* with low seating, based on exaggerated organic forms. There was a marked reaction to Modernism in Italy during the later 1960s among young designers. For example, Gatti, Paolini and Teodoro designed the *Sacco* seat for Zanotta in 1970. This was simply a textile sack filled with polyurethane granules, adaptable and formless. Inflatable furniture was also manufactured by Zanotta including the *Blow* chair designed by Lomazzi, D'Urbino and De Pas in 1967.

The pluralist approach of Pop to the past and to the mixing of styles and colour laid the ground for the revisions of Postmodernism in the mid-1970s. The dominance of Modernism had successfully been questioned by the verve and wit of Pop Design.

Porcelain Rooms

The fashion for having rooms filled with, and dedicated solely to Chinese and Japanese porcelain was an aspect of the craze for all things oriental in 17th- and 18th-century Europe. Prior to this period, porcelain was not imported in sufficient quantities to make such displays viable, and pieces of porcelain were treated instead as treasured items worthy of individual display. With the establishment of the East India companies in Holland, England, and elsewhere, the situation changed. Porcelain entered the West in far greater amounts, most often as an ancillary cargo to imports of tea, raw silk and spices. Ownership of porcelain became steadily more fashionable among the European royalty to whom it was initially restricted due to cost; the Dutch, for example, made a gift of "two large basins of China earth" to Charles I of England in 1635.

During the early 17th century porcelain was displayed in small, glass-fronted cabinets or on lavishly carved wooden wall brackets specially made for the particular item. The later move towards distinct rooms or "closets" for the display of porcelain seems to have emerged first in northern Europe. Here, the porcelain room developed from decorative traditions which already existed in Holland, where the display of "objects of virtue" on wall brackets, over doors, on and around fireplaces, and on the top of cabinets was extended to the display of porcelain by the courts of the House of Orange. The transference of this heritage to England is seen in the building of the Dutch Banqueting Room at Tart Hall (c.1641), and on the

Continent in a number of pavilions decorated in a Chinoiserie style such as the Oranienburg Palace outside Berlin (c.1663) and the Oranienstein near Koblenz (1683).

The development of the porcelain room was assisted by the work of a new breed of interior designer who integrated displays of porcelain into decorative schemes, along with the complementary use of imported lacquerwork wall panels, printed silks, and wallpaper. The most notable of these designers was Daniel Marot (c.1663–1752) whose published prints of designs for porcelain rooms (such as *Nouveaux livres de Parterments* of c.1700) did much to make them popular.

Marot's career is a useful example of the significance of royal interest to the development of the porcelain room. By the time Mary II was crowned Queen of England in 1689, Marot was virtually court designer to the woman to whom Daniel Defoe somewhat acidly attributed "... the Custom or Humour, as I may call it, of furnishing Houses with *China*-ware, which increased to a strange degree afterwards ...". Mary had been collecting porcelain steadily for some years, and had commissioned Marot to design apartments at her country house of Honslaadjik, near the Hague. These were, according to a contemporary (1687) account "very richly furnished with Chinese work and pictures. The ceiling was covered with mirrors, which showed the room afresh, so that, with the most beautiful effect imaginable, the more one gazed into the reflections, the more endlessly extended the perspectives. The chimney-piece was full of precious porcelain, part standing half inside it, and so fitted together that one piece supported another".

After Mary's accession to the English throne, the remodeling of Hampton Court Palace and the new premises built her porcelain collection provided a model which was to be followed elsewhere in England. Mary's collections of porcelain at Hampton and at Kensington Palace found parallels in many stately homes, such as the famous collection formed by the Earl of Exeter at Burghley. An obviously smaller enterprise was the "china room" of Sir Andrew Fountaine at Narford which, according to Lord Oxford in 1732 was "... a most wretched place, set out upon shelves like a shop, no red china, a mere baby room".

The porcelain rooms to be found at this time in England were small by comparison with some of those in Europe. Especially influential was that built at Charlottenburg by Frederick III for Sophie Charlotte (c.1705). The importance of this room lies in its very complete approach to the display of porcelain. Large quantities of mirror glass, and the most ornate carved and gilded mounts, are dedicated solely to displaying the collection, carefully arranged according to colour and decoration.

The grandest collection of porcelain directly influenced by Charlottenburg was formed by Augustus the Strong, Elector of Saxony and King of Poland. This was acquired relatively quickly and quite late in Augustus's life. According to the historian Oliver Impey, Augustus started collecting in about 1715, but by 1717 had acquired the Dutch Palace in Dresden (later re-named the Japanese Palace) to house the collection, which by 1723 was so large that even the cellars were fitted to take porcelain (Ayers, Impey and Mallet, 1990).

Perhaps the most significant aspect of this activity was Augustus's attitude towards the porcelain. He acquired huge

Porcelain Room, Charlottenburg, c.1705

amounts (often by buying whole collections) rather than collecting with any discernment, and pieces were given only very loose attributions such as Old Indian, *Imari*, and *Kraak*, with Japanese and Chinese wares frequently confused. This suggests that despite the collection being an important design source for the Meissen porcelain factory (itself founded by Augustus) it was its decorative role that was considered most significant.

A second and rather different evolution of the porcelain room took place in the Mediterranean countries. An early example of this trend is at the Santos Palace in Lisbon, where a room probably dating from the middle of the 17th century has a ceiling containing Chinese (Ming Dynasty) blue and white plates held in place by a wooden framework. This can tentatively be seen as an extension of the South European and Islamic tradition of using ceramics (most obviously of course tiles) within the architectural context.

On a similar scale, but using a very different approach are the porcelain rooms at Portici, Naples (1757–59; later moved to Capodimonte) and at the Aranjuez Palace, Madrid. Both were made for Carlo III, King of the Two Sicilies and later (1759) of Spain, by workers from the porcelain factory at

Capodimonte. They create a rich Chinoiserie effect by clothing the walls and ceiling with interlocking pieces of richly decorated porcelain (approximately 3,000 in all). Modelled figure groups of chinamen in various poses are framed with festoons of flowers, musical instruments and other ornamentation. The two rooms have distinct stylistic similarities, and in some cases, such as in the chandeliers which light the rooms, elements seem to have been produced using the same moulds. However, the rather more sophisticated approach to the depiction of the figure groups at Aranjuez has led to the tentative attribution of the work to Gian Domenico Tiepolo, whose work is stylistically similar, and who was working locally at the time the room was being constructed (Honour, 1961).

The decorative effect of these rooms is exceedingly rich and lavish, but they have a very different role from the North European rooms which were intended to be vehicles for the display of original oriental porcelain. However, the wife of Carlo III was a granddaughter of Augustus the Strong, which suggests a possible link between the two traditions.

By the end of the 18th century attitudes towards porcelain were changing. The integration of pieces of Meissen porcelain into the collection of Augustus the Strong at Dresden was an

early indication of the technical and stylistic advances that were to make wares imported from the Far East increasingly less fashionable beside European productions. Moreover, the demise of the Rococo style in Europe and the development of aristocratic collectors who emphasised quality above quantity hastened the decline of the porcelain room.

Portières

The French word *portiere* describes a curtain hung across a door or door opening and is a term which has come into use in English (as *portière*) because no equivalent exists. Textiles rendered as soft furnishings have always been used in domestic interiors, partly for the sense of luxury they impart but also for comfort, privacy and warmth. Portières have generally fulfilled both functions, although early documentation in England suggests more of an emphasis on the latter. The Gage Inventory of 1556 noted a curtain of green kersey (a coarse woollen cloth) "wth. a curtyrn rod of iron wh. is to hand afore the door" and also "a great hooke to putt it up when it is not

drawn". The aged Bess of Hardwick's own bedroom chamber was furnished with a "coverlet to hang before a dore", as described in the 1601 inventory of Hardwick Hall. By contrast with the rich velvets and silks in other bedchambers, the textile hangings in this room imply her desire to exclude draughts and keep warmth in.

Portières were an important feature of many grand doorways in Italian Renaissance interiors and formed an intrinsic part of the apartment system in Italy where the prevailing standard of comfort and luxury reflected the wealth and power of the city states (Thornton, 1991). They also played an important role in the unity of interior schemes through soft furnishings, which was in evidence by the 1530s, where they could match wallhangings, or bedhangings in grand bedchambers. The term used to describe such curtains during much of this period in Italy was *usciale*, until the end of the 16th century when *portiera* was generally adopted. In the 1449 Pucci Inventory (Florence), reference was found to a "panno da uscio richamato (a door cloth, embroidered)", while one of sky-blue cloth in the Tura Inventory (Siena) of 1483, was described as being embroidered with the family coat of arms. Another, of gilt leather, in the Palazzo Correr in Venice in 1584 was decorated similarly. Others, including one of Arras tapestry, had figurative decoration. The inventory taken at the Villa Medici in 1598 describes a portière of silk damask with fringe and trimmings of gold and silk, matching the wall hangings.

Portières are also represented in contemporary paintings. One of verdure tapestry, stretched flat against a door and hung over a thick rod supported on large hooks, is seen in *The Birth of John the Baptist* by Domenico Ghirlandaio (S. Maria Novella, Florence). In a *lavoro di intarsio* portrait of the Duke of Urbino, created in the Palace at Urbino during the 1470s, divided portières are drawn up and held in place by passing the bunches of fabric through two rings. Many of these decorative forms and hanging techniques were to reappear in the historic revival styles of the later 19th century.

By the 1630s Italian taste and style had been adopted in France, and in turn French fashions were imitated by neighbouring countries. By 1660 interior schemes in Northern Europe were becoming more unified. It became usual to have hangings in front of the doors of grand rooms, which would be made of the same fabric and be trimmed in the same manner as wall hangings and furniture upholstery, although they occasionally contrasted. They were described in French royal inventories of the time, and the richest, like those noted in a 1653 inventory of Cardinal Mazarin, the powerful Minister of Louis XIV's minority, had their own protective curtains.

In England, the luxurious refurnishing of Ham House was strongly influenced by contemporary French styles. In the Duke of Lauderdale's richly appointed closet, the inventories of the 1670s note "one guilt rodd over ye door" which was hung with two curtains to match those draped over the canopy of a couch, and the wall hangings of "black and olive coloured Damask" trimmed with "silver & black edging". Two-colour damask was the most expensive and luxurious of fabrics and the gilt rod used would accordingly be in keeping for the portière, which was tied back with a silk cord over a gilt hook. By contrast, the Duchess of Lauderdale's functional dressing room was furnished with a simpler portière, being of "white scots stuffe" (probably a thick woollen material), and was

Portières: two designs from Oetzmann & Co.'s catalogue, mid-19th century

replaced by 1683 with a paragon hanging (a heavy camlet or ribbed worsted fabric). By the 1690s, the fashion for completely unified decorative schemes had become widespread in most parts of Northern Europe and the published designs of the architect Daniel Marot include many illustrations of portières en suite with lavish wallhangings and bedhangings with complex flounced valances and lavishly applied fringes.

According to the historians John Fowler and John Cornforth, although portières were still in use in some French and Italian houses, they had generally fallen out of favour in English houses by the end of the first quarter of the 18th century (Cornforth and Fowler, 1974). Where they were still used they were frequently part of a matching interior. For example, Celia Fiennes noted that the best drawing room at Chippenham Park had "a very rich hanging gold and silver and a little scarlet" with a border of green damask matching the curtains and portières. Thomas Roberts charged for making curtain rods for portières at Kensington Palace in 1691–92, where portières were listed in the State Bedroom in a 1697 inventory and at Erthig, they are recorded in the Gallery in 1726. In the Dyrham inventory of 1717, they were found hanging in the Tapestry Room and State Bedroom, where they

matched the bedhangings. At Dyrham the portières are described as having valances and at Cannons in 1725, they were said to be "without valance or cornice".

Examples of divided portière curtains appear in paintings of French interiors of the second quarter of the 18th century, a period that ushered in a new sense of comfort and informality in wealthy Parisian circles. Divided portières also seem to have been used in Italian interiors of this date, often in drawing rooms (Thornton, 1984). In England references found for portières seem to indicate that their use in the middle of the century was limited to more private areas. The 1770 inventory of Chiswick House describes a "Chintz Door curtain and Rod" in the Garden Room and Closet, which in 1760 was described by Horace Walpole as being "Lady Burlington's Dressing room". A 1766 specification by the Duchess of Norfolk for the Duke's room at Worksop requires that the en suite blue indian silk damask was to have "A Door of the same to slide on a rod fixed to the Door going into the Dressing Room & fastened to the Architrave on the south side next the Bed to keep out the wind on that side."

Although draw-up "festoons" had been the most fashionable form of window curtain since the end of the 17th century,

there is little information about their use as portières. Cornforth and Fowler knew portières of this type from the later 18th century in Italian palaces, while in England, the Saloon at Stowe had “crimson festoons with rich fringe” over its four doorways. But by 1800, divided window curtains were becoming popular again and generally replaced festoons. Giocondo Albertolli’s classical designs for the Royal Palace, Milan c.1780, include one for a divided portière with a pelmet, both trimmed with fringe, and drawn up “in drapery”.

Portière curtains were not usually a feature of the austere, archaeologically-cast Neo-Classicism of the late 18th century’s most fashionable interiors. The French Empire and English Grecian style of the early 19th century adopted an increasingly exuberant use of draped wallhangings and window curtains, creating interiors for which portières would have been extraneous items. But they enjoyed renewed popularity from the 1820s when interest in this kind of hanging was no doubt encouraged first by romantic antiquarianism and second by the exploration of the architectural and decorative traditions of the Middle Ages, and the 16th and 17th centuries. Examples from this period illustrated in the Samuel J. Dornsife Collection (Victorian Society of America at the Athenaeum of Philadelphia) include an extravagant French Portière with Lambrequin – a type of pelmet formed out of shaped lappets – and clearly reflects the influence of the “Renaissance” style which assimilated most expressions of the Classical tradition.

The mid-19th century was characterised by a search for novelty and eclecticism in interior decoration; this was mostly of a revivalist nature, with the richest stylistic effects being achieved through new tours de force of the upholsterer’s art. Different historical styles were thought suitable for different rooms, depending on their function, and the use and style of portières, which became increasingly popular features, followed accordingly. Unity of design was still important for all styles, at least until the 1880s, and thereafter continued in traditional French-style rooms. Portière curtains were used mostly in more formal and public rooms, drawing rooms, dining rooms and libraries, where they were hung at entrances to rooms without doors, over sliding doors and even across hinged doors, either within the doorjamb, at the spring of an arch or on a rod attached to an adjacent wall or the door itself, as still seen at Linley Sambourne House, London.

An 1825 watercolour of the 6th Duke of Devonshire’s billiard room in the Hall of the medieval Lismore Castle in Ireland, shows simple, long and trailing, draw curtains on rods. Similiar curtains, using a more conventional classical vocabulary were provided, between 1861 and 1863, for Charles Augustus Thelluson’s newly built Italianate house, Brodsworth Hall, near Doncaster, South Yorkshire, by Lapworth Brothers of Bond Street. The Entrance Hall of this house leads through to a sequence of halls and corridors, richly marbled and linked by *scagliola* columns which provide a backdrop for contemporary sculpture. It is a formal route, linking the separately compartmented Dining Room, Billiard Room, Drawing Room and Library and is punctuated by a set of five portières and three matching window curtains. Double sided, “Ingrain Crimson Cloth” was used, trimmed all round with “Satin Binder”, woven in a gold, blue and crimson guilloché pattern, the decoration and colour scheme being echoed in the border of the crimson ground Axminster-style carpets,

across which the portières trailed, and which in turn were bordered with Minton tiles of the same pattern and colour scheme. To hold back the portières, there were “10 Gimp Embraces with Double Tassels” and to hang them, “French polished & grooved Mahogany Cornice Poles Ends rings and all fixings”. These portières survive, with few alterations, at Brodsworth Hall.

The taste for lavish, co-ordinated schemes including long, trailing portières epitomised the “eclecticism” that was so despised by many of the design reformers in the second half of the 19th century. Charles Locke Eastlake, whose influential *Hints on Household Taste* (1868) helped to popularise the work of the younger generation of Gothic Revival and reformist architects such as William Morris, Bruce Talbert and E.W. Godwin, emphasised the practical function of portières and window curtains, and recalling the simplicity of much earlier examples, he called for hangings that should “touch but not ... sweep the ground”.

The influence of Eastlake and other reformers was popularly expressed by the so-called Aesthetic Movement of the 1870s which was fashionable throughout England and America. This movement was a confluence of many differing stylistic tributaries, one being the revived Gothic ideals first formulated by A.W.N. Pugin and the medievalising of Morris, Marshall, Faulkner & Co. Thick wool plushes and stamped patterned velvets, commonly known as Utrecht velvet, could be purchased in Morris & Co.’s familiar stylised floral patterns, as could their silk damasks based on 15th-century designs. Morris’s woollen double cloths, being double-sided, were particularly suitable for portières. And embroidered curtains, such as the *Vine* portière of 1878 and Henry Dearle’s series of large silk damask portières, were unique, one-off items that exemplified Morris and Eastlake’s injunction to have only objects of beauty in the home. A Morris-style portière in the collections of the Essex Institute, Massachusetts, is made of block printed gold velvet and consists of four horizontal bands of contrasting patterns, richly decorated with couched metallic threads and gilt spangles.

The simplicity and exoticism of Japanese design also found favour among artists and designers at the forefront of the Aesthetic Movement. The architect E.W. Godwin designed several light and sparsely furnished interiors for commercial manufacturers in the 1870s that included Japanese-inspired designs for furniture, and portières whose strong horizontal banding corresponded to the Aesthetic Movement’s layering of patterns and contrasting colours on wall surfaces and mouldings. Similar treatments were illustrated by Bruce Talbert and in many of the books published in England and America in the 1870s and 1880s that were aimed at a middle-class readership anxious to express its new-found artistic sensibilities in interior design. These portières were often sewn onto rings, without pleating, and hung over simple rods on which the rings were visible. Other fashionable “artistic” styles included the exotic styles of North Africa and India which encouraged a taste for portières made from fabrics such as India shawls and Turkish or ingrain carpets.

More mainstream interiors in France and America often featured wide openings between reception rooms, particularly in houses designed in the French-influenced Renaissance styles. These openings were usually hung with portière curtains

which, in contrast to Aesthetic taste, were frequently designed to co-ordinate with the other hangings and upholstery. About 1880, the Yorkshire mill owner Henry Isaac Butterfield furnished a suite of five reception rooms at Cliffe Castle, Keighley, in opulent French style. The wide openings between the rooms could be closed off by sliding mirrored doors and were furnished with naturalistically patterned silk brocatelle portières matching the seat upholstery, wall hangings and window curtains. The pelmets of "continued drapery" were drawn up in swagged festoons, alternated and terminating in tails hung with elaborate tassels and edged with a complex fringe, repeated on the edges of the curtains drawn back by thick, double corded tasselled tiebacks. Each side of the door openings was draped with a set of these *de luxe* portières but each was in a different colour, co-ordinated with the room into which they faced. Mrs. Haweis described interiors of this type as "like a magnified *bonbonniere* in which we are the bonbons."

Despite the best efforts of the reformers, interiors became increasingly opulent and densely furnished during the 1880s and their draperies became correspondingly more elaborate. This was especially the case after the onset of the new fashion, known as "French drapery", which involved swathing mantel shelves, mirrors and other architectural features with fabric. Portières were an important feature of this new style and their use was sometimes extended to replace interior doors. Extraordinarily complex arrangements, involving richly draped and swagged material trimmed with expensive fringes and cords, and often topped by equally sumptuous pelmets, were favoured in some wealthy, upper-middle class homes.

Portières of this kind were strongly criticised by health reformers like R.W. Edis who decried such excesses as "the receptacle for dust and dirt, or the hiding places of some pet's dinner". They were also deplored by fashionable arbiters of taste like Edith Wharton and Ogden Codman, whose influential book *The Decoration of Houses* (1897) singled out portières with "yards of plush or damask, with the addition of silk cord, tassels, gimp and fringe" for particular disdain. Yet despite criticisms of this kind, the popularity of traditional, heavily upholstered styles endured within more conventional circles well into the first decade of the 20th century. By the 1930s, however, the growing influence of more Modern styles, together with a shift to smaller, more practical forms of housing, had sounded the death-knell for portières. Thereafter, hangings and upholstery generally became plainer and, with the exception of the fashion for bamboo and bead door-curtains that flourished briefly in the late 1960s and early 1970s as part of the interest in exotic and retro styles, there have been few developments in the form or use of portières in the 20th century. Similarly, although the emergence of the English Country House Style and the more recent enthusiasm for "authentic decor" may have encouraged the incidental revival of portières as draught excluders, they have never attained the same importance or level of popularity that they enjoyed in earlier periods.

Postmodernism

The failure of Modernism underpinned many disciplines from 1970 onwards. In the study and practice of literature, culture, art, philosophy and the sciences the sense of a new beginning and the creation of a new conceptual base was common. The central ideas of Modernism were a faith in technology, the reduction of nature to simple, rational laws and the linear notion of progress. These fundamental concepts were expressed by the Modern Movement in interior design during the early 20th century. Le Corbusier, for example, designed houses which were "machines for living in" – the machine ruled supreme and town planning was reduced to simplistic zoning based on mass activities. Modern architects never revived past styles. The functional, even bare, interiors were regarded as the pinnacle of achievement. Decoration was stripped away and condemned as superfluous, colour was limited. The absolute standard of "good design" dominated.

Such certainties were challenged by Postmodern designers and critics. Modernism was called into question in the late 1960s with the impact of Pop Design and the counter-cultural movement. Pop Design emphasised bright colours, wit and expendability. An early challenge to Modernism in architecture came from the American architect and writer Robert Venturi. His seminal book, *Complexity and Contradiction in Architecture* (1966) highlighted the crisis of Modernism. He argued against the universal, machine-inspired aesthetic of Modernism and advocated pluralism which would allow for regional variations, the subjectivity of the designer, the importance of decoration and past styles. In *Learning from Las Vegas* (1972) he analysed the design of roadside cafes to arrive at the point that decoration is legitimate whether its source be past high architecture or contemporary popular culture. Venturi put theory into practice with his *Architectural Chairs*,

Postmodernism: Michelle Mabelle store, Milan, by Ron Arad, 1994

which were the same in profile but were decorated in different period styles when viewed from the front.

In Britain Charles Jencks challenged Modernist architectural theory in his book, *The Language of Postmodern Architecture* (1977). Jencks used the linguistic theories of Ferdinand de Saussure and Louis Althusser to analyse design. He did not judge by a timeless, universal aesthetic but by decoding surface appearance and related meaning. He put theory into practice with the design of domestic interiors on both sides of the Atlantic. His own Thematic House in Holland Park, London of 1979–84 was based on a mixture of past styles. Each room is based on a different historical theme, from Gothic to Biedermeier. This conscious manipulation of architectural language is typical of Postmodern design. By the 1970s modern housing schemes and anonymous office blocks had alienated most of the population. Postmodern design succeeded in communicating at a popular level by mixing historical styles with appealing, playful elements. For example, the Austrian architect, Hans Hollein designed the exciting interior of the Austrian Tourist Bureau in Vienna from 1976 to 1978. The metal palm trees, reminiscent of the kitchen at the Regency Brighton Pavilion (1818–21) with copper leaves, symbolise the theme of travel. This is reinforced by a decorative lifebuoy hanging from the railing and an Austrian flag, ostensibly blowing in the breeze. Postmodern design is witty,

and it does not take itself too seriously, but plays around with signs and symbols to the delight of the cognoscenti and general public alike. Postmodern design is popularist, its ironic playfulness means something to everybody. For instance, the London headquarters of the breakfast television company, TV-AM designed by Terry Farrell in 1983 has a skyline decorated with egg-cups. The interior is dominated by brightly contrasting colours, particularly yellow and blue to symbolise the morning sun against the sky.

Italian design also contributed extensively to the creation of Postmodernism. Two groups founded in Florence in 1966 to explore the failure of Modernism were Superstudio and Archizoom Associati. Superstudio publicised their iconoclastic visions of future environments in illustrated catalogues and exhibitions. Archizoom, which was founded by architects Andrea Branzi, Gilberto Corretti, Paolo Deganello and Massimo Morozzi was inspired by the mass media, particularly television, urbanism and popular taste. The group undertook various critical projects which subverted the principles of Modernism. The *Dream Beds* of 1967, a prototype scheme for exhibition purposes, consisted of ritualistic beds decorated with a deliberately provocative mix of imagery. This included images of Bob Dylan, Art Deco and kitsch elements such as fake leopardskin. Archizoom also poked fun at the Modern Movement by designing their own version of a “Mies Chair”

in 1969 which consisted of a rubber sheet fixed taut between two metal triangles. The seat was created only when sat upon, and the rubber stretched to support the sitter. Archizoom was included in the celebrated exhibition of Italian design held at the Museum of Modern Art, New York in 1972. Italy: The New Domestic Landscape, Achievements and Problems of Italian Design consisted of micro-environments designed by leading members of the Italian avant-garde and also acted as a useful stocktaking exercise for Italian design as a whole.

Ettore Sottsass, Jr. designed a cluster of grey, plastic modules which contained different functional apparatus; one was the toilet, one the kitchen, one the sleeping area and so on. Sottsass aimed to liberate consumers from what he termed the "tyranny of the object"; living in a series of modules would enable inhabitants to arrange the surroundings according to their own needs rather than having to adapt to the rigidity of a conventionally planned dwelling. Mario Bellini designed the mobile *Kar-a-Sutra* for the exhibition which combined cushions and a glass roof with a car chassis, while Joe Colombo created the *Total Furnishing Unit*. Based on space research, this consisted of four mobile units: Kitchen, Cupboard, Bed and Privacy and Bathroom. Each unit was adaptable; the Bed and Privacy block contained beds which could be pulled out or a television with dining table and chairs. The unit was produced in white and yellow, and its smooth, rounded corners and high-tech appearance locate it in the 1970s. In 1976 Sottsass, Alessandro Mendini and Michele De Lucchi founded Studio Alchymia which continued with the Postmodern project. Through exhibition projects the group antagonised the Italian design establishment by questioning Modernism and trying to blur distinctions between high and popular culture. The Group's two collections of 1979 and 1980, *Bau Haus* and *Bau Haus Side 2* drew on the banal influences of 1950s kitsch. In 1981 Mendini exhibited the *Infinite Furniture* collection for Studio Alchymia which consisted of avant-garde furniture with movable motifs that users could arrange to satisfy their own personal taste. This typical Studio Alchymia project was intended to subvert the dominance of the individual designer over the consumer. Mendini continued to work out the problems posed for design by mass consumption throughout the 1980s, concentrating more on polemic than production.

Sottsass, by contrast, was concerned that his designs be put into production, and so he founded Memphis in 1981 with a circle of young, Italian designers like De Lucchi and British-born George Sowden. The American Postmodern architect Michael Graves and the Austrian Hans Hollein also contributed to the project. Memphis galvanised the international design scene with their display of ceramics, furniture, lighting and clocks which coincided with the 1981 Milan Furniture Fair. 1950s kitsch and plastic laminates were mixed with Aztec decoration and elements of "good" design. At the second Memphis exhibition of 1982 Sowden showed the *Luxor* wardrobe with its screen printed door in a bold pink and powder blue design. Surface patterns such as these inspired design worldwide, as can be seen with the corporate identity of the British chain of record shops, HMV which used a leopard-skin print for the interiors of its shops during the 1980s.

The designs of Memphis initially shocked the design establishment, but it wasn't long before manufacturers were producing Memphis designs commercially, and the radical and the

mainstream merged during the later 1980s. Zanotta, Driade and Artemide commissioned Memphis to produce designs, and Alessi commissioned an exciting range of metalware from avant-garde designers such as Aldo Rossi and Michael Graves. This work represents the classical strand of Postmodern design. While the work of Archizoom and Memphis was inspired to a significant degree by mass culture, there was a contemporary strand in the critique of Modernism that centred around a reactionary revival of 18th-century classicism. This was particularly the case in Britain, where a collection of "Young Fogies" tried to forget that Modernism had ever happened. Architects Quinlan Terry and Robert Adam have created Georgian-style buildings for use as offices and homes. For architects of this school of thought, Modernism was a brief and unfortunate interlude in the traditional narrative of classicism.

The classical tradition underwent a revival in France during the 1980s. Andrée Putman's designs for the offices of the Minister of Culture in Paris incorporate traditional *boiseries*, lighting and window treatment with Postmodern furniture. Postmodern design in France received official encouragement during President François Mitterrand's term of office. Jean-Michel Wilmotte, Philippe Starck and Ronald Cécil Sportes were commissioned to decorate the private apartments of the Elysée Palace in 1983. A plurality of styles is in evidence, from Art Deco to High-Tech. With such official support, French Postmodern interior design flourished during the 1980s and 1990s. Starck's design of the Hotel Paramount, New York (1990) uses an adventurous mixture of materials. Artificial roses sprout from the marble-faced entrance hall and in the conference room matt aluminium is used to face the walls. In America this concentration on materials has been dubbed "High Touch" by the editor of *Interiors* magazine, Robert Janjigian. He identified the work of American designers Kevin Walz and Rex Designs who manipulate unusual materials in interior design to surprising effects. Concrete furniture, formica-covered cupboards and hand-sanded, steel chairs combine to introduce a craft presence in the domestic interior in stark contrast to the tendency of new technology to be packaged in Modernist black boxes. This new materialism has also found resonance with British designers, particularly Nigel Coates. He encapsulated the splendid decay of Europe by combining metal girders, columns, brickwork and the wing of an aircraft in his design for the interior of Caffé Bongo, Tokyo in 1986. Like members of the "High Touch" school, Coates uses the inspiration of literature, drawing and fine art in his work.

Such diverse influences also inspired the Deconstructivist revolt against the hegemony of Modernism in architecture and interior design. At the Deconstructivist Architecture exhibition at the Museum of Modern Art, New York in 1988 and the Deconstructivist seminar at the Tate Gallery, London in the same year the radical approach of French philosopher, Jacques Derrida was applied to design. This resulted in architects designing buildings that looked as if they were literally falling apart. At the Parc de la Villette in Paris Bernard Tschumi designed a series of pavilions which aimed to dismantle fixed meaning and to present buildings which have multi-layered significance. The exhibition halls, devoted to the public display of science and technology, are flexible with no fixed routes

through, and multi-media displays to distract the spectator at every turn. Following directly on from the Deconstructivist tendency, Charles Jencks has now incorporated recent scientific theories around chaos and complexity to explain and inspire future architecture and design. In *The Architecture of the Jumping Universe* (1995) he argues that a new world view has emerged which recognises that nature is creative and that previous divisions between nature and culture no longer exist. Designers should draw inspiration from the dynamic and surprising aspects of the universe and not impose a narrow, Modernist understanding of form, drawn from a machine aesthetic. Jencks cites the work of Peter Eisenman, the SITE group and Frank Gehry as exemplifying this more organic and complex aesthetic. This latest development in the overthrow of Modernism is a further refinement of Postmodernism. Designers are now more self-conscious of the multiplicity of styles at their fingertips. There is more respect for a broad range of materials and for the environmental impact of design today. There is also more respect for the consumer, the user of the building, rather than the Modernist vision of a universal language that everybody was impelled to learn.

Print Rooms

The term Print Room is the name given to interiors decorated with arrangements of black and white prints, cut out and framed with engraved paper borders, and pasted directly onto a plain coloured wall. Such schemes were fashionable mainly in England and Ireland from the 1750s to the early 1800s and were predominantly a feature of wealthy and aristocratic homes. They were most often employed in secondary areas such as bedrooms, closets, small dining rooms and dressing rooms where the highly idiosyncratic nature of their appearance complemented the informal nature of these settings and formed a marked contrast to the richness and formality of the decorations used in state and public rooms. The background colours of the walls were generally quite light – buffs, straws and creams were popular in the 18th century as were yellows and shades of pale blue and blue-grey. Other than this, however, print rooms obeyed few rules and the arrangements themselves could vary from the rigidly symmetrical and complex to the fairly random and simple. Indeed, their principal attraction was their novelty and individuality, and they afforded welcome opportunities for their owners to exercise ingenuity and personal taste both in the selection of prints that were used and in the manner in which they were combined. More than forty examples have been documented, suggesting that such schemes were quite popular, and a recent revival has resulted in the fashion for interiors that aim to reproduce the effects of 18th-century originals.

Precedents for the Print Room can be traced back to the 16th century when Italian cognoscenti and noblemen decorated the upper parts of their studioli with friezes of etchings and engravings. But it was not until the 1720s that the practice of arranging prints all over the wall emerged, when it was first taken up in France. It began as more of a hobby than a serious artistic pursuit, and according to contemporary observers fashionable Parisian gentlewomen spent many of their leisure hours cutting up coloured prints to paste down onto boards and make into wallhangings and screens. Several examples of whole rooms decorated with prints are documented, although most, such as the Moulin (mill-house), built in 1783 for the Hameau of Mesdames Adélaïde and Victoire at Bellevue, where 95 Chinese prints and an assortment of engraved paper decorations imitating mouldings and cameos were stuck down on English green ground wallpaper, date from the last quarter of the century.

In Britain, the fashion for Print Rooms emerged some twenty years later than in France and was confined almost exclusively to the use of black and white prints. Engravings of the most admired Old Masters, classical sculpture, and the most celebrated monuments of antiquity had long been collected by country-house owners on the Grand Tour. But by the mid-18th century developments in copper-plate engraving greatly increased the supply of cheap, good quality, reproductive prints and the passion for print collecting among the nation's cognoscenti increased. One of the earliest enthusiasts was the antiquarian Horace Walpole who described two of the bedrooms at Strawberry Hill as decorated with black and white engravings stuck down on yellow and red paper grounds in 1753. Until quite recently this description was thought to represent the earliest mention of print rooms in Britain, but

Print Room at Castletown, Co. Kildare, c.1773

Walpole was neither the first, nor the only collector to employ such schemes. Additional examples have been documented at Cassiobury, Hertfordshire, where the Duchess of Northumberland recalled "a hall fitted up with Prints on a Straw coloured Ground" in 1752, and at Russell Farm, near Watford, where the same writer described a "Very good Dining Room ... fitted up with prints on yellow paper" later in the same year.

By the final quarter of the century the fashion was in full swing and the relatively simple appearance of the earlier schemes had given way to more complex arrangements involv-

ing additional decorative elements such as paper swags, festoons and brackets, as well as various kinds of cut-out paper borders, ribbons and bows which were interspersed among the prints. Many of these accessories were available from a number of specialist print-sellers and a flourishing trade grew up that catered specifically for this market. The work of the London-based engravers J. Mayor and François Vivares, for instance, was apparently in high demand and a Vivares catalogue of 1753 advertised "all Sorts of the best Borders, Festoons and Trophies, Etc. Likewise all Sorts of Prints for Hanging Rooms". Examples of his frames and floral decora-

tions are preserved in the Print Rooms at Rokeby Park, Yorkshire (c.1775) and at Woodhall Park, Hertfordshire (1782).

The Print Room at Woodhall Park, created for Sir Thomas Rumbold, is among the most elaborate of any of the surviving schemes. It was fitted out with more than 300 engravings, including a set of Piranesi's *Views of Rome*, engravings of the pilasters from Raphael's Vatican Loggia, a large number of Swiss landscapes, copies of famous paintings, and small oval portraits of English and foreign notables. These are interspersed with innumerable prints of busts, plinths, vases and floral swags and the whole ensemble is arranged symmetrically to complement the proportions and architectural features of the room on a pale blue ground.

The complexity and sheer scale of this scheme clearly required the skills of a professional designer – in this case R. Parker – and several upholsterers were quick to take advantage of the extra business that this style of decoration might afford. No less a person than Thomas Chippendale was involved at the Print Room in Mersham Le Hatch, Kent, where he charged £14 for “Cutting out the Prints, Borders and Ornaments and hanging them in the Room Complete” in 1768. But more frequently this work was done by amateurs, and references in several letters and diaries mention the cutting up of frames and ornaments for prints as an especially enjoyable means of whiling away the hours spent indoors during long, rainy afternoons. Moreover, many of these amateur schemes were quite sophisticated, and the decorations created by Lady Louisa Conolly in her dining room at Castletown, Co. Kildare (c.1773) combined groupings of oval, octagonal and rectangle-shaped prints with arrangements of floral swags and festoons in a manner that was both elegant and skillful.

By contrast, the chaotic positioning and somewhat crude assembly of the engravings in the caricature room at Calke Abbey, Derbyshire, betray the efforts of a less talented hand. This room was decorated with a selection of satirical prints after Thomas Gilray and his contemporaries. Such thematic consistency was comparatively rare. Most print rooms used an extremely varied assortment of work and, with the exception of one or two examples, like the room at Bretton Park where all the prints came from Piranesi's *Views of Rome*, and another at Stratfield Saye, Berkshire, which was entirely filled with Russian scenes, there was little standardization in the choice of themes. Similarly, as mentioned previously, there was also little uniformity in terms of the style in which the prints were displayed. But, as the lightness and delicacy of Rococo styles gave way to the formality associated with Neo-Classical taste, arrangements became on the whole more simple and the simplest treatments can be seen in the severely plain effects created in the early 19th century rooms at The Vyne, Hampshire (c.1815) and Heveningham Hall, Suffolk, (c.1810) where no additional ornaments were employed. Similarly, economical effects also proved quite popular in Sweden where English-style print rooms became highly fashionable in the 1790s after Gustav III used the technique to decorate one of the rooms in the Royal Palace, Stockholm, with engravings by Piranesi.

After 1820 few print rooms were devised and it was not until the middle of the 20th century that this form of decoration began to be revived. Pioneers within this field include the

Mexican aesthete and millionaire, Carlos de Beisteguy, who commissioned a print room in his château at Groussaye, near Versailles, in the 1950s, and Desmond Guinness, President of the Irish Georgian Society, who recreated an 18th-century print room in Leixlip Castle, Co. Kildare, during the 1970s. Since then, heritage organizations like the National Trust have played an important role in stimulating an interest in such schemes. The Trust has restored print rooms at Blickling, Norfolk, Calke Abbey, and The Vyne, and their most recent project has been the restoration of the print room at Uppark, Sussex. Increased exposure has also led to a growing demand within the commercial sections of the market. During the 1980s Laura Ashley featured a print room in their decorators' catalogue and several firms of interior decorators on both sides of the Atlantic now specialize in creating customized print rooms.

JOANNA BANHAM

Selected Works

Documentation exists for more than 40 print rooms in Britain, Ireland and North America; important examples survive at Ston Easton Park, Somerset; Castletown, Co. Kildare; Rokeby Park, Yorkshire; Uppark, Sussex; Woodhall Park, Hertfordshire; Calke Abbey, Derbyshire; The Vyne, Hampshire; and Stratfield Saye, Berkshire.

Printed Designs

The spread of styles and tastes through Europe during the 16th and 17th centuries was a haphazard process but often an effective one. The dispersal of designs through commercial ventures, wandering craftsmen, exchanges of ambassadors and courtly gifts were all important mediums, while the transmission of ideas could also take the form of objects, models or casts, verbal descriptions and printed designs. The role of printed designs either in sheet or book form was to become the primary method of dissemination from the middle of the 15th century.

The earliest printed designs on paper were woodcuts, which

first appeared around the end of the 14th century. The woodcut process was a relief printing method whereby a block of wood might have a design cut into it so that when it was inked and applied to paper, only the raised portions would register as colour, leaving the remaining part of the design white. This process meant that multiple copies of a design might be produced, as the blocks could be used many hundreds of times. Although initially used to reproduce pictorial fine art images, woodcuts were also used as a medium for designers.

More successful was the notion of producing printed designs on paper through the adaptation of goldsmiths' techniques, resulting in what are known as engravings. First recorded in 1446, line engravings are produced by using a graving tool pushed into a copper plate to cut the design. Once completed the plate is inked, but the surface is then wiped over only leaving ink in the cut lines (*intagliate*). Damp paper is then laid onto the plate and both are rolled through a heavy press. This method transfers the ink from the grooves to the damp paper that is forced into them.

Whether produced as relief woodcuts or *intaglio* metal plates, the prints would have been quickly adopted by a variety of trades as a ready source of ornament that could be transferred to their particular needs. In addition, the decorative title pages of un-illustrated books would have been another source for designs and patterns ready for adaptation by craftsmen.

Although the earliest engravings are considered to have been produced by goldsmiths for their own use, designs of an architectural nature were soon followed by interior details as well as decorative forms that could be adapted to many interior arts. As prints were soon considered common currency, it is difficult to be specific about the reasons for individual productions, however it is clear that demand was very high and many engravings were re-worked many times, some being re-used over a period of 200 years or more. It is also clear that there was no demarcation between usage. The same printed designs might be used for architectural detailing, furniture, silverware, ceramics, stained glass or other ornamental use. Sources of patterns in the oriental style for example, were widely adapted to architecture, furniture, textiles and wallpaper in the 18th century.

Among the earliest engraved designs were those from Italy. Italian engravers were quick to capitalise on the decorative finds associated with excavations of their own Roman remains. Interpretations of sources derived from these classical remains were soon produced in widely published engravings and helped to establish a canon of designs that were to be influential across Europe. Two main decorative themes were soon apparent, which were to remain important for many years. The first, entitled *la candelabra* was based on a central pillar with an arrangement of scrolls on each side, either naturally or in a complex arrangement built up with other motifs. It is clear that this format of design was easily adapted to pillars, panels, and window surrounds as well as furniture. The second was the *grotesque* which was a highly adaptable arrangement, often symmetrical, containing figures, connected to other parts of the design by a scaffolding itself linked with monsters, vases, trophies, putti, scrolls, and various architectural elements.

Grotesque designs were disseminated by Italians such as the engraver Enea Vico (1523–67) as well as painters like Raphael

and Giovanni da Udine. In the mid 16th century, grotesque designs were used at Fontainebleau, while the combination of strapwork and grotesques was developed and engraved by Antwerp designers like Cornelis Floris (1514–75) and Cornelis Bos (d. 1556). Vredeman de Vries (1526–1604) was also responsible for the engravings of such work and encouraged its popularity in Northern Europe. The versatility of the grotesque meant that it was suitable for regular or irregular wall spaces, or for flat surfaces such as textiles or bookbindings, indeed it could be adapted by the designer for almost any decorative surface.

The role of Italian designers who reproduced grotesque ornament in engraved designs was important for much of the 16th century. The grotesque designs of Agostino Veneziano, working in Rome in the 1520s and 1530s, became very influential among designers in Northern Europe including Lucas van der Leyden and J. A. DuCerceau, while the work of Enea Vico was also highly influential on DuCerceau and others. His decorative framed portraits based on his numismatic experience were responsible for many variations of profile head designs combined with decorative borders.

The works of Sebastiano Serlio (1475–1554) represent a milestone in the progress of engraved design. An Italian painter, born in Bologna, who later moved to Venice, he was the first to bring out a widely illustrated book on architecture. The work entitled *L'Architettura* was published in six non-consecutive parts between 1537 and 1551. The influence of these volumes was soon apparent. The engraved work, which represented the architectural Orders as well as examples of the grotesque, was reprinted with translations into Flemish in 1539, German in 1542, French in 1545, Spanish in 1563, and English in 1611. This clearly demonstrates the spread of Italianate Renaissance and Mannerist styles in Northern Europe. Serlio's illustrations were used widely by furniture carvers and for panelling work, and his ceiling designs were particularly recommended for transfer to furniture. Serlio's Books IV and VII include designs for chimneypieces which can be found in Burghley House and Hardwick Hall.

The efforts of entrepreneurs such as Pieter Coeck (1502–50) were also important in this process. Coeck was himself a designer but was also responsible for Flemish, German and French translations of various of the books of Serlio.

There appears to be little parallel in Italy for the books of engraved ornamental design found in Northern Europe. In the Low Countries craftsmen were influenced by Lucas van der Leyden who published engraved designs in the 1520s derived from Veneziano. These decorative designs of Renaissance grotesques and other detail were ideal for woodcarvers and goldsmiths, but were also influential as sources for enamels and stained-glass windows. The Low Countries also benefited from a translation of Serlio's *Fourth Book of Architecture* in 1539. This was supplemented by Hans Vredeman de Vries (1526–1604), whose work *Variae Architecturae Formae*, published in Antwerp during 1560, was soon followed by his works on ornament. Vredeman's influence spread far beyond his native country as his designs were usually practical rather than inventive, making them accessible to a whole range of craftsmen.

The complex relationships between the various designers can be exemplified in Vredeman's borrowings from DuCerceau

Printed Designs: engraving of grotesque ornament by Cornelis Bos, mid-16th century

and Crispin de Passe's borrowings from Vredeman. Perhaps these interconnections helped in the construction or development of a codified style.

In Germany developments in engraved design followed the same pattern, starting with textbooks on perspective such as Lorenz Stör's *Geometrica et Perspectiva* (1567) and then developing into books on architecture, which were then combined into architectural primers. These would include the Orders as well as designs for decoration and furniture, for example, Wendel Dietterlin's (1551–99) *Architectura und Ausztheilung der V Seülen* (1594) which showed designs for windows, chimneypieces, doors and so on, arranged in the five orders in combination with the strapwork grotesque style.

German skills in engraving included the work of Peter Flötner (1493–1546) of Nuremberg who used woodcuts to illustrate designs that incorporated classical motifs, grotesques, arabesques etc. He is remembered for his *Kunstbuch* published three years after his death which has Moresque designs which were to be very influential throughout Germany. The Master HS also produced woodcuts for furniture and wall panels around 1530–40 which, although derived from Flötner, have a "crude" artisanal quality. His importance therefore lies in the

demonstration of a craftsman producing his own interpretation of high-style models. On the other hand, the influence of Crispin de Passe's *Oficina Arcularia* (1621), with its depictions of the orders followed by furniture designs, was to set the tone for many subsequent publications up to the end of the 18th century.

In France, engravings relating to interior decoration were produced by Jacques Androuet DuCerceau and his publishing house which specialised in architectural and ornamental designs. From his *Grotesques* (1550) to *Les plus excellents batiments de France* (1576 and 1579), with a number of influential works in between, DuCerceau's role as a disseminator of Mannerist and grotesque ornament cannot be overestimated. The influence of the French engraved designs took on an even greater importance by the middle of the 17th century.

The works of Jean Barbet (1591–1654?), Jean I Berain (1640–1711) and in particular Jean Le Pautre (1618–82) were to be widely influential through their engraved designs. In all cases designs were adapted or redrawn and reissued in other capital cities of Europe. Barbet influenced Inigo Jones and his designs were partly reproduced in London in 1674; Berain's designs eased the advance from Baroque to Rococo; while Le Pautre's engravings of Roman Baroque ornament based on the work of Le Brun were published in London, Amsterdam, Augsburg, and Nuremberg. Indeed his designs were reissued in Paris in 1751. All this activity increased the output of French designers and engravers and made French superiority in interior design a self-fulfilling process.

The importance of France was neatly explained by Christopher Wren when he told how the engravings he had purchased in Paris would "give our Country-men Examples of ornament and Grotesks, in which the Italians themselves confess the French excel" (Thornton, 1978).

The 18th century was also witness to a wide range of designers whose work was reproduced in engraved form, often as bound books, and was to have a widespread influence of decorative arts and interior decorations. J.F. Blondel (1705–74), an architect who initially designed engraved plates for others' architectural works, published *De la Distribution des Maisons de Plaisance* in 1737 which was influential in defining Rococo designs for interiors and ornament. Blondel inspired François Cuvilliers (1695–1768), who mainly worked in Germany and was responsible for much of the Munich Rococo style. His designs were published as engravings in Munich, Augsburg and Paris, the first appearing in 1738, with a second series in 1745, and a third in 1756.

Important engraved designs in a range of styles from Neo-Classical to the Baroque and even Rococo were published by Jean Delafosse (1734–91) in his *Nouvelle Iconologie Historique* produced in 1768 with a second edition in 1771. An edition for the Dutch market was produced in Amsterdam.

The work of many other important designers is also known through their surviving engravings. Masters such as Daniel Marot (c.1663–1752) published their works in various editions as an *Oeuvre*. The same method was used by Juste-Aurèle Meissonnier (1695–1750) whose collected designs were published in 1734.

It seems clear that printed patterns were an important source for craftsmen both for direct borrowing as well as a springboard toward their own inventions. The publication of a

growing number of pattern books did not interfere with the engraved print market which seems to have been complementary to the books. In some cases the prints were perhaps seen as expendable; they were cut up and put into scrapbooks, in comparison to pattern books which were often prized library possessions.

The history of printed ornament is therefore the history of changing taste in design. However, in many cases published designs have acted over many years as the basis for a model which has then been adapted by exaggeration or diminution. It is for this reason that 18th-century furniture designs, 17th-century candelabra, or 16th-century maiolica might have their origins in engraved designs produced anything up to 250 years before.

Printed Textiles

Printed fabrics have been used in home furnishing since ancient times, but early production was limited to small quantities because of the time-consuming hand methods required to print cloth. Block printing of dyes with hand carved hardwood blocks was practised in many countries, and continues to the present in Asia. Several types of resist printing using wax, starch, or mud were devised, and are now used mainly in tropical countries. Discharge printing, in which the cloth is first dyed and then the design bleached out, also continues as a hand production method.

Early block printed textiles often had patterns that derived from those found in Byzantine and Italian woven textiles, and for much of the 16th and 17th centuries they appear to have been used as a cheap alternative to woven silks and velvets. With the establishment of the Dutch (1597), English (1600) and French (1664) East India Companies, however, large numbers of painted and dyed Indian cloths began to be imported into Europe. These lightweight fabrics were far superior both in appearance and quality to their European counterparts. They were brightly coloured and had exotic floral (chintz) designs and were soon in demand for fashionable furnishings and hangings.

The popularity of Indian cloths prompted European manufacturers to produce imitations and to improve their methods of printing. The first of the technical innovations was intaglio printing from a flat engraved copperplate. Such printing was begun in Drumcondra, Ireland in 1752 by Francis Nixon and Theophilus Thompson, and Nixon is credited with setting up the first English copperplate printing works in Merton, Surrey, in c.1756. The size of the plate made pattern repeats up to a metre in length possible, but only in one color. Purple, red, sepia, and blue were favored. Additional colors were sometimes added by hand with blocks or a technique called “pencil-ing”, but the monochrome prints themselves were very fashionable as hangings and upholstery.

For much of the third quarter of the 18th century, London printers enjoyed a virtual monopoly of copperplate printing, but in 1760 the technique was taken up by C.P. Oberkampf who opened a printing works at Jouy-en-Josas in France. Although Oberkampf’s factory also produced block prints, or indiennes, it became famous for its *toiles de Jouy*. *Toiles* were monochrome prints – usually red, black and blue – depicting realistic landscapes, architectural features, and historical scenes, many of which were designed by Jean-Baptiste Huet. They quickly became popular as furnishings and in grand houses they were often used in the summer months as a replacement for the heavier silk or wool textiles used for winter wallhangings, upholstery and loose covers. Copperplate printing, which was introduced at Jouy in 1770, was eventually

Printed Textiles: block-printed indienne, Jouy, late 18th century

rendered obsolete by engraved copper rollers adopted by the factory in the 1790s.

During the first decades of the 19th century the centre of printed textiles moved back to England where the new technique of rotary printing from engraved metal rollers was increasingly used after 1815. The initial patent was taken out by Thomas Bell in 1785, and roller printing was already being done in parts of Lancashire by 1790. At first its usefulness was limited to the printing of small dress patterns, but it soon adapted to accommodate the larger patterns required for furnishing fabrics. Rotary printing allowed for much faster production because cloth could be printed continuously and rolled on bolts during the printing process. However, the size of pattern repeat was limited by the diameter of the roller (rarely more than 30cm.), and pattern motifs became smaller.

Another advantage of roller printing was that it could be done in multiple colours, making it possible to copy the colourful block prints. And advances in dye chemistry, which developed alongside improvements in machinery, had a dramatic effect upon the palette of furnishings and upholstery generally. Whereas previously most printing was done with vegetable dyes which produced a limited number of soft, rich hues, by 1830 a whole new range of colours was being produced from mineral sources, including manganese bronze, chrome yellow, single green, and antimony orange. The effect of these new dyestuffs was to produce colours that were much brighter and harsher and, despite their fine drawing and engraving, most mid 19th century printed textiles were extremely garish.

The designs themselves were fairly eclectic and changed every two to three years. During the early 19th century Indian and Chinese chintz-style patterns were popular as they had been for much of the preceding century, but Neo-Classical patterns also became fashionable as did *trompe-l'oeil* designs

imitating architectural details, swagged drapery, woven silks and needlework. Revivals of past styles were a recurrent feature after 1820 with neo-Gothic, neo-Renaissance, and French styles taking the lead, and the perennial floral patterns, drawn in increasingly naturalistic styles, remained popular, especially for bedrooms and sitting rooms, throughout much of the 19th century. Mass production meant that printed textiles were available on an unprecedented scale at prices that most people could afford. So, whereas previously they had been limited to the houses of the upper classes, by the mid 19th century even quite modest houses might contain decorative fabrics used on beds, furnishings, and at windows.

Modern textile printing has been greatly enhanced by the introduction of screen printing. Screen printing is very versatile in that almost any design can be reproduced with great fidelity. The technique of printing fabrics with a stencil held in place by silk threads or human hair was first used in Japan in the second half of the 17th century. Later a silk screen was used with a squeegee to force ink through the screen. In the 19th century silk screening was used to print a small group of expensive silks at Lyon. Although commercial patents for screening processes were taken out in America in the early 20th century, the first commercial printing in quantity is believed to have been in France in 1926. Hand screen printing was used for furnishing fabrics in Europe and America from the 1930s until the 1950s when the process was mechanized. Mechanization, computerization, and the use of nylon and polyester screens has made screening the most economical type of textile printing in use today.

The influence of individual artists and movements in the art world on textile design has been evident throughout the late 19th and 20th century. William Morris not only encouraged a return to the softer, subtle colouring characteristic of vegetable dyes, he also did much to reform the state of late Victorian design, producing stylized representations of natural forms that were inspired both by botany and historical examples. Abstract patterns were introduced following the New York Armory Show of 1913. The Wiener Werkstätte (Vienna), the German Bauhaus, and French Art Deco influenced textile design in the 1910s and 1920s. The taste for Scandinavian "modern" in the 1950s extended to fabrics with bold, colorful geometric designs. Finnish companies such as Marimekko specialized in high-quality prints for cushions and wallhangings. In the 1960s large-scale floral designs were popular.

Japan has recently taken over innovation in design and process. The Miyake Design Studio in 1977 developed laser-beam printing of geometric prints in graduated colors. Hiroshi Awatsuji has been well known as a textile designer since he founded his own design studio in 1958. Although the emphasis in Japan has traditionally been on clothing fabrics, the eclectic tastes of modern consumers make it certain that new fabrics will find their way into furnishings, regardless of the original intent.

Another recent printing innovation is the heat-transfer process in which designs on waxed paper are applied to fabric that is passed through heated rollers. This is often used for pictorial designs on bedsheets and other piece goods. The print is very long-lasting, although it has a rather stiff finish until the piece has been laundered several times.

Furnishing fabrics are generally distinguished from dress-

making fabrics by larger designs and heavier weight. However, lighter weight fabrics have been used for bed quilts since the introduction of the first chintz fabrics from India. Some were used whole as coverlets, but often individual motifs were cut out and appliquéd to a background cloth to make a larger piece with a new design. *Toiles de Jouy* were cut up and pieced, as were printed squares intended as handkerchiefs. Makers of patchwork quilts from the late 18th century to the present have utilized dressmaking fabrics with smaller prints to form geometric designs in which the printed patterns have no relation to the final form except as part of the color scheme. These printed cotton pieces come from any source that the quilt-maker has at hand, particularly remnants of fabric used for other purposes. An unusual source of fabric in rural America of the 1930s and 1940s was the printed cotton sack in which flour or animal feed was sold. These feed sacks were printed in colored designs similar to popular commercial goods, and were widely used for quilts, curtains, and other household purposes.

Recently there has been a revival of many print patterns from the past such as floral calicoes and "document", or historical styles made specifically for use in quilting and "country" furnishings. Tropical fabrics including batik, African prints, and Hawaiian prints have also become popular as quilt materials.

Protective Coverings

As interiors in Europe became increasingly sophisticated at the end of the Middle Ages, the desire to protect the furnishings, which often represented considerable financial investment, prompted the use of various protective covers. Dirt, sunlight and wear were recognised as the major enemies of interior furnishings, particularly upholstery and fragile furniture finishes, which unlike modern products, were expected to last beyond a single generation. In an introduction to *The Housekeeping Book of Susanna Whatman* (1987) Christina Hardymont describes how "great houses spent most of the time shrouded in a perpetual twilight against the twin enemies of light and dust. When Mr Sponge set off on his Sporting Tour, 'he had the house put away in Brown Holland, the carpets rolled up, the pictures covered, the statues shrouded in muslin.'"

While "case covers" for beds and seat furniture in particular had a protective function, they have also operated at certain periods as the primary cover and as an intrinsic part of a decoratively co-ordinated interior. Protective covers were made for bed hangings, curtains, carpets and rugs, furniture, wallhangings and tapestries, books, pictures and watercolours, and were generally made of less expensive, more utilitarian materials, such as leather, cottons, linens or woollen fabrics such as baize (or bays), broadcloth or flannel. Oilcloth, usually employed as cheap floorcovering, and paper were also used. Some protective covers were incorporated into the everyday operations of a household and removed exclusively for special occasions, whereas others might only be brought out when the residence was not in use. Protective covers of leather, serge or paper were also made for fragile furniture and other items for transportation.

Protective covers, along with sun curtains and blinds, were an important aspect of "housekeeping". Surviving manuscripts of house-owners in the 18th century and the rigorous instruction manuals published in increasing numbers in the 19th century show a strong awareness of the destructive effects of time, the elements and over-zealous cleaning, clumsy handling or vigorous use. Certain practices became household rituals, aimed towards the preservation of "the best", those costly symbols of wealth, status and taste used in principal rooms, that were expected to last for several generations, "so as to become part of a family's dignity and evidence of its antiquity." (Cornforth 1974). These measures included the removal and storage of the most precious and expensive textiles – notably bed and wall hangings – when not in use. In the mid 17th century, Cardinal Mazarin's most sumptuous wall hangings had specially made bags in which they could be stored, called "housses". The Parisian practice of changing hangings according to the season was taken up at Ham House in the latter part of the 17th century, where plain silk in the summer replaced the winter's rich damasks and patterned silk velvets. This practice is also documented in French royal households in the 18th century. The simplest of protective measures could be wrought from lengths of fabric such as the "several large Pcells of Flannell for covering ye. Furniture" recorded at Dyrham in 1710. This practice of "loose covering" has continued into the present century.

Early use of more strategic protective covers for tables

concurrent with the mid- to late 17th century fashion for inlay and marquetry, japanning and the use of imported oriental lacquer. Normally these covers would be removed on special occasions although some, like the use of rare Turkey carpets as "table carpets" (*tapis de table* in France) or examples like the fringed "green sarsnet case" (a thin silk used also for sun curtains) for the ebony table with silver mounts described at Ham House in 1679, were ornamental in their own right. Leather, often decoratively stamped and lined, was generally used for protective purposes. In *The Italian Renaissance Interior, 1400–1600* (1991) Peter Thornton describes "a *sopra panno* of red leather lying over a *panno* of red taffeta with furbelows and fringes" that was recorded at the Villa Medici in Rome in 1598. In France, in the mid 17th century, Cardinal Mazarin's tables in his famous Gallery had leather covers of "maroquin du Levant rouge cramoisi" trimmed with gold fringe. By contrast, the 1684 Inventory of the contents of Kilkenny had "cases" of black leather to cover a table and candlestands, while others had "printed leather carpets" and a long table had a cover of "damask leather". The 1710 Inventory of Dyrham Park, near Bristol, describes the contents of interiors furnished in the 1690s and at the turn of the century. Like the billiard table at Ham House, that at Dyrham had a cover of this material, as did a number of the fashionable "triads" of candlestands and pier tables (en suite with a looking glass), and writing tables which were described as being "India" or "Japan" (lacquer or japanning), or "wallnut Tree inlaid". Leather covers of the late 17th century originating from Ham House survive in the collections of Colonial Williamsburg, Virginia, and include a rectangular furniture arm cover with linen ties, a chair seat cover and two table covers, one bound with silk tape, the other with leather strips.

In the mid 18th century, the fashionable Rococo style, followed by the Neo-Classical and romantic Gothick style, initiated the use of carving and delicate finishes for furniture such as paint and gilding, and a revival of lacquer and marquetry, often enriched by the use of expensive gilt brass (ormolu) mounts. Leather covers continued to provide a protective function. In 1746 Ann Pascall supplied leather covers with "a Rich pair of Carved Stands Gilt" to Temple Newsam House, Leeds, whereas a less fragile firescreen of mahogany was supplied with a cover of green serge. For Neo-Classical interiors designed by Robert Adam at Audley End House, Essex, a pair of naturalistically coloured floral marquetry table tops (to place under looking glasses in the Great Drawing Room) were provided in 1773 with damask leather covers by the cabinet-makers and upholsterers Gordon and Taitt, as was a small circular table with painted and gilt ornament for the even more elaborate Etruscan-style Little Drawing Room. Thomas Chippendale provided Ninian Home at Paxton with half-round end sections for a dining table which also functioned as pier tables, supplied with "2 Damask leather Covers lind and Bound with Gilt leather", a similar arrangement being found at Audley End in 1797. Sleeves or socks of leather were sometimes provided to protect fragile carved and gilt bedposts or chair legs. For the most lavish schemes, such as the seat furniture made for Sir Lawrence Dundas, "leather cases lin'd with Flannel" were supplied in addition to the more usual cotton case covers. These are similar to the "covers for pier tables, made of stamped leather and glazed, lined with

flannel to save the varnish" which are recommended by Sheraton in his *Cabinet Dictionary* of 1803. Sir Rowland Winn of Nostell Priory also ordered gilt leather "spots" from Chippendale on which to stand candlesticks and protect furniture from abrasion and hot wax.

Woollen fabrics, notably serge, baize (or bays), broadcloth and flannel were also used for protective purposes; in 1603, the Great Chamber at Hengrave had "one large bord clothe, or grene clothe, to laye over ye carpetts of ye longe borde" as well as two other green covers for the cupboards and a square table top ("borde"). During the 18th century, Chippendale supplied green serge covers for the carpet, bed and pier glass in the State Bedroom at Harewood House. In addition to the more usual case covers co-ordinated with decorative schemes, the intricately carved and gilt seat furniture in "the Antique style" in the Little Drawing Room at Audley End also had "a Set of white Flannel Cases" supplied by Gordon and Taitt in 1773. Simple "green Cloth" covers, such as that specified for table-carpets at the Capitol by the Williamsburg House of Burgesses in 1703 and the "green broadcloth covers" used to protect mahogany dining tables for New York Governor William Tryon's council chamber were probably similar to those used to protect a table at Audley End in 1797.

Cheaper woollen fabrics were also in more general use for the protection of floors and carpets. In 1710, the two best staircases at Dyrham Park, one of Virginia walnut and the "Best Stair Case" in William Talman's wing of 1702 in cedar, had protective covers of "coarse Cloath". The rare and costly imported carpets of the 17th century, often used as table covers, became more commonly used as floor coverings in the early 18th century, and although floor carpets made by native factories in England and France became more available, they were still comparatively expensive. Subsequently, wool covers, normally baize or serge in the 18th century, were often provided for protection, either for hand-knotted carpets or the less expensive fitted carpets which more commonly serviced less important interiors. These covers were referred to as "capes" by Ninian Home of Paxton in a letter to Chippendale of 1789. (The 1710 Inventory of Dyrham Park mentions silk "caps" for stools.) In 1778 Sir Gilbert Heathcote was charged two guineas by Chippendale for "Thread and piecing out the Serge Carpet in Breakfast Room to fit the floor, making eyelet holes in do and laying down with studs Compleat". Chippendale also supplied both the "large Carpet, [and] A green baize cover to do" for Sir Lawrence Dundas's London townhouse. At Audley End, the 1797 Inventory describes a piece of baize for the rare and valuable carpet of Moore's tapestry, the only carpet protected in this manner in the house. In America, Aaron Burr's New York residence had an "Elegant Turkey carpet" protected by "a Carpet of Blue Bays". At Harewood, Reid the upholsterer laid carpet on the great staircase, with a protective covering of oilcloth and serge. The same fabrics were also be used for so-called crumb carpets, laid beneath a dining table to protect the carpets beneath from food and drink. At Audley End oilcloth was used for "Side Boards" and may have been used as a protective crumb carpet for the Turkey patterned Axminster carpet in the Dining Parlour.

Cheaper and lighter grades of linens, notably brown Holland, were used for protective covers for delicate upholstery. The 1827 Sale Catalogue for Attingham Park, Shropshire

reveals that the lavish continued drapery curtains of the Dining Room, which had been supplied by Gillow & Co. in 1805, were being sold (at an estimate of £89.5s) with a brown Holland covering for one guinea. The everyday chintz case covers supplied to much seat furniture in the 19th century, as a matter of course, could also be supplied with a top cover. A “swagger” portrait of 1870 by Tissot (National Portrait Gallery, London) includes one sofa with decorative chintz cover, harmonising with the wallpaper, and another with its looser fitting white dust-cover, on which the subject, Frederick Gustavus Burnaby, is casually seated.

During the 1850s, John and Josephine Bowes used the Parisian firm of Monbro fils aîné to fit out the Château de Louveciennes, from the grandest to humblest service areas. A corresponding “housse” or protective cover for almost every piece of furniture was supplied in a white cotton called “bazin” (with a satin-weave stripe). These were dust-covers, and were provided for “wall-hangings, seat furniture, chandeliers, candelabra, clocks, hearth furniture, tables, even cloak pins and hat pegs.” The firm was retained to put the house under wraps when the Boweses moved on: to take down and store the curtains, clean and make repairs, and in turn to prepare it for their visits when the dust-covers were removed and packed away in parcels.

Lapworths Brothers of Bond Street furnished Brodsworth Hall, near Doncaster similarly, where in addition to the chintz case covers made for much of the seat furniture, “Brown Holland Bags for Curtains / Loose Cases for Furniture and Chandeliers” were supplied, using 461 yards of brown Holland. The 1885 Inventory also describes 47 pieces of Holland wall coverings, two large crumb cloths and various large gauze covers which may have been intended to keep flies away from lustres on cut-glass chandeliers or dusters away from gilt mirror frames.

Protective paper cases were the most ephemeral. They were often used for objects in transit, as dust jackets for bed and window cornices, and there are references to paper covers for chairs and being used to cover curtains. Celia Fiennes saw paper sheets pinned to beds and hangings at Ashstead Park in the late 17th century, and linen was used in this way at Felbrigg Park almost a century later. In the Audley End inventory of 1797, the Drawing Rooms had their “Sattin Hangings” protected by “paper covering to do. / on Canvas”. Mrs. Parkes in *Domestic Duties* (1825) suggested cartridge paper, and the American publication *The Workwoman's Guide* (1838) recommended that “large sheets of coarse brown paper pasted together in lengths should be laid over the beds to catch the dust”.

Although housekeeping practices using such a wide range of protective covers have declined during the 20th century, many country houses open to the public during the summer months have over the past decade been put to bed for a much needed rest over the winter months. Protective paper covers envelop small decorative objects, light fittings, mirrors and picture frames made of conservators' acid-free paper, linen and glazed cambric dust covers have been individually made up for larger pieces of furniture and precious textiles and carpets and floors are drugged. These protective measures, based on traditional

practices, have been revived to assist the long-term preservation of the artistic heritage.

Prouvé, Jean 1901–1984

French metalworker, engineer and furniture designer

Jean Prouvé was trained as a metalworker, not as a designer. He was always modest about his design skills and was content to work for other designers. His great contribution was to bring to the world of architecture and interiors his skill and belief in industrialisation in general and in pressed metal in particular. Because of the limitations of this material, Prouvé was at his best on relatively small-scale projects or in situations where other designers would set out a framework leaving him to design and make the cladding and the finishes.

Always one to practise what he preached, Prouvé was, for most of his life, head of a metal fabricating shop. Separation of design and manufacture was, for him, the source of many of our problems. Prouvé was himself a craftsman and he never referred to himself as an architect or as a designer; he saw himself as a maker and he enjoyed the construction of prototypes of products or details as part of the design process. Prouvé was very interested in the nature of materials, and he created some innovative buildings in plywood and in plastics; but pressed steel was his great love and he explained how it needs to be folded to give it strength and how it requires

rounded corners as right-angled ones are a source of weakness. The use of the folded sheet, often with the edges exposed to show its nature, and the curving of corners are the hallmarks by which his designs can be recognised.

Chairs were the right size for experimentation in the metal-work shop and, until he lost his workshops at Maxéville in 1953, he produced a steady stream of chairs, a few of which went into production. The first chair, made in 1924, is a simple affair with hollow steel structural members and a seat cantilevering forward off chunky back legs. Interest in moving parts followed, with seats that had great semi-circular arms of steel, hollow sections and a hinged back which can rotate along the arm from upright to reclining positions. His most elegant chair was made in 1937; it has a sheet of Plexiglas curving to form seat and back in the manner of Alvar Aalto chairs of the time, and the framing is of tapering aluminium sections with holes drilled in them like the high-tech designs of forty years later. Stools, office tables and school desks followed, and the school desks were used throughout a school he designed in 1947 at Vantoux in Moselle. Prouvé's furniture is always sensible, often very clever, but only the 1937 Plexiglass chair has real magic.

For his small buildings Prouvé naturally liked to make as much as possible out of pressed steel. This material, in a gauge thin enough to be easily pressed, is suitable only for very short spans, so the interiors of Prouvé-designed houses often have internal supports in the living rooms. He usually celebrated this support and enabled it to take horizontal loads by making it an inverted V; its placing is a key part of the planning as well as the structure.

Prouvé was keen to use his chosen material to make the key elements of his buildings complete, arguing that factory production was quicker than site work and that, given reasonable production runs, it was also cheaper. As is so often the case, the requisite large orders were not forthcoming, and so his best ideas remained hand-made prototypes. They were nevertheless very influential. The 1956 prototype house, built as an exhibit on the banks of the Seine in central Paris, has a circular core which is load bearing and contains kitchen, wash-room, heating, and all the plumbing in the house. It was also factory-made, to the extent that photographs show it being craned into place with all the saucepans swinging on their hooks. Other building elements to emerge complete from the Prouvé workshops are the pressed steel staircase, a beautiful example of which was included in the Pavillon de l'Union des Artistes at the 1937 Paris International Exposition, and the lobby, elegantly seen as the entrance to the Pump Room, Evian, built in 1956.

One building sums up all Prouvé's beliefs, and that is the Maison du Peuple at Clichy, designed together with the architects Beaudouin & Lods and the engineer Vladimir Bodiansky. Completed in 1939 just as the war began, this building has rarely been accorded the importance it deserves in books on modern design. At Clichy the modern dream of the absolutely flexible / infinitely changeable building came nearer to realisation than anywhere else. The ground floor is typically a market which can be open to the streets around or closed as one wishes. Above is an auditorium for 2000 persons, or up to eight smaller rooms. The floor of the auditorium can be removed to turn the upper floor into a gallery to the ground

floor below. The roof of the building can open to give an open air auditorium or, with the first floor removed, an open air market. Neither the building of the Centre Pompidou nor the imagery of Archigram have developed the idea of change to such an extent. The building occupies an entire city block, and, apart from the primary steel frame and a concrete floor around the perimeter of the first floor, everything was made in the Prouvé workshops. The roof moves with its own motors on board, like a gantry crane. The floor panels are coupled like railway tracks and slide onto a rack to be lifted into position. Vertical partitions ran out in tracks from their storage positions, and are also electrically driven. This was in 1939, yet such a proposal would be considered outlandish today.

JOHN WINTER

Biography

Born in Paris, 8 April 1901, the son of the painter, Victor Prouvé. Educated in Nancy until 1916; self-taught in architecture; apprenticed as a metalworker in Paris under Emile Robert, 1916–19, and under the blacksmith Adalbert-Georges Szabó, 1919–23. Married Madeleine Schott, 1924: 5 children. Military service, 1921–23; active member of the French Resistance in Nancy, 1940–44; Mayor of Nancy after the Liberation, 1945. Established his own furniture and metal fittings workshop, Nancy, 1923–40; factory at Maxéville, 1947–53; opened design studio, Paris, 1954. Founded Les Constructions Jean Prouvé with Michel Bataille, 1954–56 (taken over by Compagnie Industrielle de Matériel de Transport, CNIT, 1957); director, CNIT, 1954–66; in private practice as consultant engineer, Paris and Nancy, 1966–84. Consultant engineer to CNIT and UNESCO, 1957–70. Designed furniture from 1923; developed movable curtain wall systems c.1930; developed pre-fabricated structures from late 1940s. Instructor, Conservatoire National des Arts et Métiers, Paris, 1957–71. Founder-member, Union des Artistes Modernes, Paris, 1930; vice-president, Cercle d'Etudes Architecturales, 1960, and president, 1971. Awarded many honours and prizes including Chevalier, 1950, and Officier, 1957, Légion d'Honneur; Grand Prix d'Architecture de la Ville de Paris, 1982. Died in Nancy, 23 March 1984.

Selected Works

Examples of Prouvé's furniture and metal fittings are in the Centre de Création Industrielle, Centre Georges Pompidou, Paris. Additional furnishings and the Jean Prouvé archive, including drawings, designs, catalogues and photographs, are in the Burg Beverungen Chair Museum, Berlin. A full list of his engineering commissions appears in Emanuel 1994.

Interiors

- 1923–25 Numerous furnishings and interiors, Nancy
- 1933 Cité Universitaire, Nancy (interiors and furniture)
- 1935 Compagnie Parisienne d'Electricité, Paris (façade panels and office interiors)
- 1936–37 Roland Garros Aero-Club, Buc (building and interiors)
- 1937 UAM Pavilion, World's Fair, Paris (staircase)
- 1938–39 Maison du Peuple, Clichy (building and interiors; with the architects Beaudouin & Lods and the engineer Vladimir Bodiansky)
- 1940 Portable pre-fabricated cabins (with Charlotte Perriand and Pierre Jeanneret)
- 1946 Swiss Consulate, Nancy (interiors and furniture)
- 1947 Experimental School, Vantoux (building, interiors and furniture)
- 1950 Cité Radieuse, Marseilles (architect: Le Corbusier; staircases, kitchens and furnishings)
- 1954 Jean Prouvé House, Nancy (building, interiors and furniture)

- 1956 Source Cachat Pump Room, Evian (building and interiors with the architect Novarina)
- 1958 Maison Sahara, Exposition Arts Ménagers, Paris (pre-fabricated housing; with Charlotte Perriand and Claude Prouvé)
- 1962 Museum and Cultural Centre, Le Havre (interiors and fittings; building by architects Lagneau and Weill)
- 1965–70 Prototype petrol stations for Total France

Prouvé's Maxéville workshops also produced furniture for Jacques Ruhlmann and Charlotte Perriand. His own furniture was sold exclusively by Steph Simon in Paris.

Pugin, A. W. N. 1812–1852

British architect, designer, antiquary and theorist

Architect, designer, and polemicist, A. W. N. Pugin was the first and most vigorous apologist of the Gothic Revival and played a central role in the development of mid 19th century British architecture and design. During the course of his brief career he almost single-handedly stimulated a radical reassessment of

medieval architecture and demonstrated the applicability of the Gothic style for contemporary buildings and furnishings. He also argued for a new understanding of the role of ornament, particularly flat pattern, in both architecture and the design of objects. And perhaps most significantly, his writings suggested a direct relationship between plastic form – the material shape and construction of objects – and Christian ethics, proposing the notion of "honesty" or "propriety" in ornament and design. This idea, albeit secularised and extensively modified, was to become one of the central tenets of Modernist design theory.

Pugin's early work as a designer was strongly influenced by his father. Augustus Charles Pugin was one of many craftsmen who fled France during the Revolution and on arriving in England he had become a draughtsman for John Nash, producing ornamental designs in the fashionable romantic Gothick style. Augustus Pugin's own precocious talent for drawing was evident in a number of significant, though isolated commissions executed in a similar style while he was still an adolescent. These included designs for Gothic furniture for Windsor Castle made by Morel & Seddon (1827), and silver for Rundell & Bridge (1826–27). This work encouraged him to establish his own decorating firm in Hart Street, London, where he produced furniture and metalwork in the Gothic, Elizabethan and Jacobean styles between 1829 and 1831. From 1829 to 1832 he was also successfully employed as a stage carpenter at Covent Garden, devising Gothic scenery for the opera *King Henry VIII* and the ballet *Kenilworth*. This experience, although somewhat short-lived, was to inform the theatricality characteristic of his later work in interior design.

Shortly afterwards Pugin developed a strong interest in Roman Catholicism. A series of bound manuscript volumes of sketches dating from 1832–33 contains drawings which explored the material culture of medieval Catholicism in considerable detail and records his close observation of surviving 15th- and 16th- century buildings, monuments, furniture and metalwork. These drawings also show him beginning to present Gothic art as an exclusively Catholic phenomenon, a viewpoint that shaped his understanding of medieval art for the remainder of his life, and in 1835 he converted to Catholicism.

The year 1835 was in many ways a turning point in Pugin's life: as well as becoming a Catholic, he met Charles Barry and worked on the spartan interiors for King Edward VI Grammar School in Birmingham, and he published his first book, *Gothic Furniture in the Style of the 15th Century*. By the end of the year he was again working as a draughtsman for both Barry and Gillespie Graham on their respective entries for the competition to build the New Palace of Westminster.

From this time on his activities were very varied and he was tirelessly engaged in architectural and design projects and writing. His works as an interior designer fell into three broad categories: aristocratic commissions, his collaboration with Barry on the New Palace of Westminster, and domestic and institutional interiors in the "reformed" Gothic style. All these works were underpinned by theories which were expressed in a prodigious quantity of letters, pamphlets and books on architecture, design and religion, the most important of which were *Contrasts* (1836), *The True Principles of Pointed or Christian Architecture* (1841), and *Floriated Ornament* (1849).

In *Contrasts* Pugin compared the beauty of 15th-century Catholic-Gothic architecture with the ugliness of contemporary Grecian and Gothic styles. The book was also, however, a radical polemic against the social and moral ills of the 19th century and presented a vision of pre-Reformation England as stable, harmonious and pious that contrasted sharply with the poverty, divisiveness and inhumanity of the modern industrial world. It was a key text in the development of an anti-industrial culture that subsequently bore fruit in the work of William Morris and the Arts and Crafts movement. Yet unlike later writers and designers, Pugin never rejected the hierarchical nature of medieval society. Rather, he viewed the Middle Ages as an ideal period when society was dominated by the church and ruled under a system of benign feudalism and where standards of material comfort were dictated by social station. The insistence on social differentiation also formed an integral part of his attitude to design and coloured many of his better known statements on function and decoration.

The True Principles of Pointed or Christian Architecture represents another important landmark in Pugin's campaign to demonstrate the supremacy of medieval art, and shows him attempting to communicate his understanding of the Gothic style to a professional audience. The principles of Gothic architecture were still only very vaguely understood by the majority of architects in the mid 19th century, and a major criticism levelled against the style was its lack of a theoretical framework comparable to the discipline of the Classical Orders. Pugin was determined that the style should never be merely a pastiche of genuine medieval work and he therefore attempted to abstract basic principles of design from ancient examples. The results of this project were summarised in a number of magisterial rules, the most celebrated of which were that "no features were introduced in the ancient pointed edifices which were not essential either for convenience or propriety" and that "all ornaments of true pointed edifices were merely introduced as decoration to the essential construction of the building". These two ideas, "honest" construction and the correct application of ornament, represented a radical rejection of the superficial historicism and use of meretricious ornament that characterised much early and mid-Victorian decoration and design, and they formed the basis for progressive thinking on design until the end of the 19th century.

Although Pugin's writings influenced many architects, he himself received comparatively few commissions for complete buildings. The first project over which he had complete control was the design and decoration of his house, St. Marie's Grange, near Salisbury (1835). This compact three-storey villa was furnished with a mixture of his own designs and medieval antiquities that he had purchased on the Continent. A water-colour of the library and chapel shows a multitude of details derived from late Gothic interiors: the joists of the roof were exposed and painted, a narrow frieze in the library carried a sacred text in uncial script. The doorway connecting the two rooms had a shallow Perpendicular arch with carved and painted spandrels. The bulk of Pugin's output during the following years, however, consisted of designs for furniture and interior decoration, and it was in these spheres that he scored his first success. An early commission was the decoration of Taymouth Castle, Perthshire (1838–42) where Pugin was employed by Gillespie Graham to provide all the interior

detail. Richly carved panelling, enlivened by painting and gilding, plays a significant role in shaping the interior spaces and the Banner (Great) Hall features late Gothic-inspired screens as a major component of the design. The use of this type of carved woodwork to establish a high-status interior would become a recurrent feature of Pugin's work. Typically, this practice was based on his observation of surviving medieval examples, but it was also encouraged by patrons whose tastes had been shaped by the romantic atmosphere of antiquarian houses such as Sir Walter Scott's Abbotsford (1812).

Pugin's first major independent architectural commission was for the remodelling of Scarisbrick Hall, Lancashire (1837), for the wealthy Catholic, Charles Scarisbrick. Much of this work concerned the structure of the building, but the interiors, conceived to complement the owner's collection of medieval and Tudor antiquities, included elaborate Gothic settings and furniture developed from the designs in *Gothic Furniture* and for St. Marie's Grange. The Great Hall was remodelled c.1840 with an imposing and archaeologically-correct timber roof. Flemish carved panels, Gothic in character but mostly dating from the 16th and 17th centuries, were incorporated into a dark, ornate screen that had a traceried gallery at first floor level. While the forms of the room and the decoration were medieval, the overall effect of the hall was far less bleakly architectural than that of the late 14th century spaces – for example, Westminster Hall, London, or Penshurst Place, Kent – on which Pugin's arrangements were based. Colour was used extensively, especially to decorate coffered timber ceilings, and on the mosaic floor in the Great Hall. The result was a rich, antiquarian interior that seems somewhat at odds with the bold simplicity advocated in *True Principles*. Much of Pugin's work remained unfinished at his death and many of his planned additions, including the greater part of the furniture, were never executed.

By far the most extensive of Pugin's secular design schemes was the huge commission for the furnishings of Charles Barry's New Palace of Westminster. Pugin personally designed all the furniture, textiles, wallpapers, lighting and metalwork, as well as much of the exterior architectural decoration for this vast building. The manufacture of these items was entrusted to a small team of carefully selected collaborators whom Pugin also used on many of his other projects and who understood how to interpret his often very generalised designs. Metalwork was produced by the Birmingham firm of John Hardman & Co., ceramics (mainly encaustic tiles) were made by Herbert Minton, and the furniture was made in London by two firms, John Webb and J.G. Crace and Son. Crace and Son also executed the painted decorations which were a key element in Pugin's handling of the ceremonial chambers and supervised the production of his wallpapers.

The first spaces to be completed, and where Pugin's style can be seen at its most dramatic, were the suite of ceremonial chambers leading from the North Porch to the House of Lords. These rooms (the Norman Porch, the Royal Gallery, the Prince's Chamber, and the House of Lords itself) were linked decoratively by the use of carved panelling, surmounted by areas of painted decoration, and deeply coffered ceilings with painted and gilded ornament. The climax to the scheme, both symbolically and visually, was the debating Chamber of the

Lords. Here the richness of the decoration and an emphatic distribution of primary colours produced a uniquely splendid and unified effect, suggestive of both ecclesiastical sanctity and secular authority. Pugin also designed a standardised range of furniture, textiles and wallpapers for other rooms in the House of Lords.

A strong element of differentiation distinguishes Pugin's designs for the Lords and the Commons. This was intended to reflect the differing status and functions of the two "Houses" and is exemplified in the small but significant differences in the colouring and decoration of items such as the standard chairs designed for either House in 1850. Many of Pugin's wallpapers also reflect the hierarchy of different rooms. He designed over a hundred patterns for the Palace, all of which demonstrate his commitment to medieval sources and the use of conventionalised ornament and flat areas of colour. The larger, richly coloured, heraldic designs, derived from 15th-century textiles, were hung in the more important public areas, while smaller, lighter patterns containing simple floral motifs were intended for the private apartments and service rooms. After his death, Pugin's designs were re-used throughout the Palace, although Crace produced their own scheme for the decoration of the Lower Chapel of St. Stephen in 1860.

Crace also worked with Pugin on the decoration of Pugin's second house, The Grange, built at Ramsgate in 1843–44. The Grange represents an early example of the mid-Victorian taste for raising the elevations of a house from a functional plan to produce a picturesque arrangement of volumes. It contained several idiosyncratic features, such as a lookout tower from which Pugin could view shipping in the Channel, and a private Catholic chapel, but overall its most distinctive feature was the boldness of the colour of the decorations used in every room. Several of the wallpapers were also used in the Palace of Westminster and it seems that Pugin favoured patterns printed in red, blue and gold on a white ground. In general, the opulence of the walls and ceilings was offset by oak furniture of simple construction with little decoration. The interiors exemplified the Reformed Gothic style that Pugin thought most suitable for middle-class homes, and writing to Crace in 1849 he argued for the commercial production of Gothic wallpapers and furniture on the grounds that "the great sale will be in articles within the reach of the middling classes, clergymen furnishing parsonages etc. ...".

By 1850 Pugin was tirelessly engaged on several large domestic commissions – Chirk Castle (from 1846), Eastnor Castle (from 1849) and Lismore Castle (from 1850) – and the continuing demands of his work at Westminster still occupied a great proportion of his time. But the following year he took on another major project, the organisation of the Medieval Court at the International Exhibition of 1851, which brought some measure of long-awaited success. He assembled a variety of objects made to his design by Hardman's, Minton's, Crace, and Myer's and other favoured manufacturers, and the display was generally regarded as representing one of the high points of the Exhibition. Throughout his career, however, popular acceptance of his work was hindered both by the stridency with which he expressed his views and his determined defence of Catholicism. And increasingly wearied by overwork and critical attacks on his beliefs, he suffered a mental breakdown from which he never fully recovered in 1851 and died prema-

Pugin: Drawing Room, Eastnor Castle, Herefordshire, 1849–50

turely in 1852. He died believing that he had failed in his ambition to re-establish the True Style, as he called Gothic, but in fact his work had a profound impact on British architecture and design. His emphasis upon honesty in construction and function, and the synthesis of structure and ornament set a new agenda for British design and defined the parameters within which the majority of influential architects and designers worked during the second half of the 19th century.

NICHOLAS SHADDICK

Biography

Augustus Welby Northmore Pugin. Born in London, 1 March 1812, the son of the architectural draughtsman, Augustus Charles Pugin (c.1769–1832). Trained as a draughtsman and designer under his father and made several study trips to France in the mid-1820s. Designed furniture for Windsor Castle in 1827; employed by the royal goldsmiths Rundell and Bridge; stage carpenter and designer, Covent Garden 1829–32. Married 1) Anne Garnet, 1831; 2) Louisa Burton, 1833; 3) Jane Knill, 1834; sons included the architects Edward Welby Pugin (1834–75) and Peter Paul Pugin (1851–1904). Established his own business, designing and making furniture and decorations in 1829; business failed 1831. Studied architecture from 1832; by 1835 he was designing interiors for Charles Barry including drawings for work at the Palace of Westminster; c. 1837 began collaborating with the Birmingham glass and metalwork manufacturer, John Hardman, and established his career as an independent architect. Converted to Catholicism in 1835 and began designing Roman Catholic churches from 1837. Started to build his own house, The Grange, at Ramsgate in 1843; began long professional association with the interior decorator J.G. Crace (1809–89) and renewed work on the Palace of Westminster in 1844. A prolific writer on architecture and the decorative arts, he published innumerable pamphlets and articles and several highly influential books, including *Contrasts* (1836) and *True Principles* (1841), from the mid-1830s.

House of Lords opened in 1847. Appointed Commissioner of Fine Arts and supervised the design and planning of the Medieval Court at the 1851 Great Exhibition. House of Commons opened 1852. Died, after periods of increasing mental instability, in Ramsgate, Kent, 14 September 1852.

Selected Works

Extensive collections of Pugin's designs and architectural drawings are in the Royal Institute of British Architects Drawings Collection and the Victoria and Albert Museum, London. Manuscript material including correspondence between Pugin and J.G. Crace is kept in the manuscript collection, Royal Institute of British Architects Library. The Hardman Archive is in the Birmingham Public Reference Library; material relating to Pugin's work for the Palace of Westminster is in the House of Lords Record Office; drawings for registered designs are held in the Public Records Office, London. Numerous examples of Pugin's furniture, metalwork, textiles, stained glass, ceramics and wallpapers are held in the Victoria and Albert Museum, London.

Interiors

- 1837–45 Scarisbrick Hall, Lancashire (additions and interiors including the Great Hall, Oak Room, King's Room and Library): Charles Scarisbrick
- 1837–52 Alton Towers, Staffordshire (alterations and interiors; with J.G. Crace from 1844): 16th Earl of Shrewsbury
- c.1841–51 Bilton Grange, Warwickshire (renovations, additions and interiors; with J.G. Crace from 1846): Captain H. W. Hibbert
- 1843–44 The Grange, Ramsgate, Kent (building, interiors and furniture): A. W. N. Pugin
- 1844–52 House of Lords, Palace of Westminster, London (interiors including fitments, furnishings and decorations; with J.G. Crace)
- 1846–52 House of Commons, Palace of Westminster, London (interiors including fitments, furnishings and decorations; with J.G. Crace)
- 1846–48 Chirk Castle, Clwydd (internal alterations to the East Wing including fitments and decorations; interiors of the Long Gallery, Entrance Hall and principal Reception Rooms including decorations, fittings and furniture; with J.G. Crace): Colonel Myddleton Biddulph
- 1847–48 Burton Closes, Derbyshire (additions and interior decoration; with J.G. Crace): John Allcard
- 1849–50 Eastnor Castle, Herefordshire (interior decoration, fitments and furniture; with J.G. Crace): Earl Somers
- 1850 Lismore Castle, Co. Waterford, Ireland (interior decoration; with J.G. Crace): Duke of Devonshire
- 1850 Leighton Hall, Montgomeryshire (interior decoration): John Naylor
- 1851 Medieval Court, Great Exhibition, London (design and interior decoration)

Pugin's first designs for furniture appeared in Rudolph Ackermann's *The Repository of Arts* in 1825; his own firm began manufacturing his designs from 1829. By the 1840s his designs were being made by several cabinet-makers including John Webb, Crace & Sons, Myers, Gillows, and Holland and Sons. Designs for encaustic floor and wall tiles, tableware, stoves and other ceramics were manufactured by Minton & Co. from the mid-1840s. Designs for metalwork were executed by Rundell & Bridge, c.1827; George Frederick Pinnell 1837–38; John Hardman & Co. from c.1838. Designs for painted decoration and wallpapers were supplied to Crace & Sons from 1844; wallpapers printed by Scott, Cuthbertson & Co. Designs for woven and printed fabrics, carpets and embroidered hangings were supplied to Crace & Sons from 1844 and were executed by J. W. Ward of Halifax, Daniel Keith & Co., and Bannister Hall Printworks near Preston, Lancashire. Designs for stained glass were produced by William Warrington (1838–41), Thomas Willement (1841), William Wailes (1841–45), and John Hardman & Co. (1845–52).

Putman, Andrée 1925–

French interior and furniture designer and entrepreneur

Andrée Putman's body of work in the contemporary design world is noted for its sophistication, timeless elegance, and quality, all of which results in what critics have called a "quiet dialogue between elements in her overall design." What started with a personal fascination with Modernist furniture designs of the 1920s and 1930s has elevated Putman into one of today's most sought-after designers. Putman's style, much like that of the Modern Movement, includes monochromatic color schemes of grays and black, simple lines, and the use of new and unique combinations of textures and materials such as etched glass, polished nickel plating, birdseye maple, and gauze netting. Putman says of her work, "... my strength is my personal sensitivity blended with a lot of eclecticism; the ability to reconcile things that are apparent contradictions."

Her project list is long and impressive, with commissions spanning the spectrum of interior categories around the globe within a relatively short amount of time. She has designed apartments, shops, and showrooms for top fashion designers Yves Saint Laurent, Karl Lagerfeld, Thierry Mugler, and Azzedine Alaïa. Her work also includes hotels, galleries, museums and museum exhibits, restaurants, offices for French officials, conference centers, and a hair salon.

Putman is strongly influenced by Eileen Gray, a designer and architect from the early 20th century. So impressed was Putman with Gray's designs that she has acquired the rights to selected furniture pieces – rugs, the *Transat* chair, mirrors – and is reissuing them through her company, Écart International. The Écart collection also includes works by other Modernist designers such as Robert Mallet-Stevens, Mariano Fortuny, Jean-Michel Frank and Pierre Chareau, and her own work and the work of young, talented contemporary designers.

Putman's intended career was music, but she gave it up after winning the highest award at the Paris Conservatoire at the age of twenty. She was told that in order to create a musical composition, she would have to lock herself away for at least ten years, and her thirst for discovery and sense of adventure would not allow her to become a prisoner to music. Nevertheless, Putman's training in musical composition expresses itself in her designs in a clear sense of balance, harmony, and rhythm. She has also been guided by her instincts and by a strong sense of style; "For me", she wrote, "when something works, it always comes from deep inside."

The fact that Putman's training in interior design has been "on the job," makes her achievements all the more remarkable. Lacking any formal design education, she gained valuable work experience as a stylist for the French department store Prisunic, where she commissioned well-known artists to design lithographs, tableware, fabrics and other household wares, and championed the use of inexpensive, well-designed domestic furnishings. She also worked as a writer on home interiors for the French magazines *Elle* and *L'Oeil* and as a style consultant for product marketing, both jobs that helped to develop her sensitivity for design.

Among her early commissions, Putman's design for Morgan's Hotel (1984) on Madison Avenue in New York, was

especially important in revolutionizing the way in which hotels were designed. She challenged every aspect of the traditional luxury hotel experience – from the use of materials to the large, lavish lobbies. This was her first project in the United States and the attention she received brought her instant recognition and many more commissions. The black and white checked tile bathrooms (used because of the tight budget) became one of her trademarks, along with the simple, elegant detailing.

Most of Putman's subsequent projects have also challenged traditional notions of interior design, whether these be for the Museum for Contemporary Art in Bordeaux (1984) or the Écart International showroom and office (1985). Many of her projects have been within the context of historical buildings. She is expert at creating interiors that are respectful of the existing structure, being careful not to overpower its essence or spirit. The Wasserturm Hotel (1990), a luxury hotel in Cologne, is a good example of what Putman calls her "... ability to reconcile things that are apparent contradictions." Very few physical alterations could be made to this historic landmark water tower designed in 1868 by Englishman John Moore. Putman departed from her trademark black and white check for softer forms and colors that reinforced the circular water tower form.

Putman's design company, Écart, was established in 1978. The word *écart* – which means "off the beaten track" or "marginal" – was indicative of the way in which she viewed her work in relation to the rest of the design world. The company's first interior design assignment was for the Yves Saint Laurent Rive Gauche boutiques in the United States. Its 1984 layout for the office of the French Minister of Culture, Jack Lang, which used classic Modernist furnishings by designers such as Pierre Chareau and Eileen Gray was greatly admired and widely publicized. Écart has also designed boutique interiors for other clients including the couturiers Karl Lagerfeld, Thierry Mugler and Balenciaga, and it has grown into three separate companies: Écart International which sells re-editions of furniture, lighting and rugs by Gray, Chareau, Mallet-Stevens, Fortuny and Putman's own work; Andrée Putman Écart which works on interiors; and Andrée Putman Licensing which licenses rugs, textiles, tableware, home accessories and luggage.

Like the more classic designs of the Modern Movement, Andrée Putman's work has stood the test of time. She is now generally accepted as one of France's foremost interior and product designers, and her influence on design will be felt well into the 21st century.

ANN L. BLACK

Biography

Born Andrée Christine Aynard in Paris, 23 December 1925. Educated at the Collège d'Hulst, Paris; studied piano at the Conservatoire, Paris; mainly self-taught in design from 1960. Married Jacques Putman (divorced): 2 children. Journalist, *Femina* magazine, Paris, 1950–52; design columnist, *Elle* magazine, Paris, 1952–58; interiors editor, *L'Oeil* magazine, Paris, 1960–64. Employed as a stylist for the Prisunic stores, Paris, 1958–67; designer with Maimé Arnodin and Denise Fayolle's MAFIA publicity agency, Paris, 1968–71; founder-member, with Didier Grumbach, of Créateurs et Industriels fashion and furniture designers group, and Director, Créateurs shop, Paris, 1971–76; founder-manager, Écart S.A. furniture and interior design company, Paris, from 1978 and Écart International, Paris, from

Putman: Jack Lang's office, Ministry of Culture, Paris, 1984

1983. Designed interiors and furniture from the late 1970s. Received Interior Design Hall of Fame Award, New York, 1987. Officier des Arts et des Lettres, France. Lives and works in Paris.

Q

Quarenghi, Giacomo 1744–1817

Italian architect

Giacomo Quarenghi's architectural and artistic legacy belongs in equal measure to two countries – Italy and Russia. In Italy, the influence of the architect Andrea Palladio and a love of ancient classical architecture combined to form Quarenghi's artistic credo; it was here that he gained his experience and achieved his first professional successes. However, Quarenghi spent most of his life in Russia, and it was in Russia that he achieved greatest fame, becoming one of the leading exponents of Neo-Classicism and designing some magnificent palaces and public buildings.

Quarenghi's work in interiors was equally extensive and included unique designs for state rooms and living quarters, picture galleries, libraries, studies, museums and theatres. He combined a compositional simplicity and clarity, together with the dignity of monumental architectural forms, with diverse methods of artistic synthesis. He was himself an excellent artist with impeccable taste and he called on the expertise of numerous decorators and specialist painters. By harnessing their unique skills, he was able to unite all the elements of interior design.

Having completed a number of projects in Italy, including the reconstruction and decoration of the Church of St. Scholastica in Subiaco near Rome (1769–73), Quarenghi accepted an invitation from the Empress Catherine II and travelled to Russia in 1779, where he found himself at the centre of extensive construction work. He undertook numerous projects in Moscow, as well as in various provincial centres and country estates, but his most significant contributions to architecture were associated with the Russian capital St. Petersburg and its neighbouring imperial residences (Tsarskoe Selo, Peterhof). The 1780s and 1790s marked the golden age of Palladianism in Russian architecture and Quarenghi was instrumental in its development. As far as Quarenghi himself was concerned, these years marked a period of considerable creativity in which he undertook his most significant work.

Quarenghi began his career in Russia by designing the English Palace for the Empress Catherine II at Peterhof (1781–94); here he showed himself to be a master of the ceremonial and dignified interior. The severe and laconic decoration of the palace's halls was typical of Quarenghi's decorative

style. The state rooms were already huge, and the rectangular designs, which Quarenghi clearly preferred, lent an additional clarity and balance to the internal space. And, most importantly, Quarenghi determined the artistic effect of his interiors by linking the strong plastic qualities of the ordered elements (colonnades and half-colonnades) with the sculptured and painted decor which matched the architecture, both rhythmically and in terms of its architectonics.

In the 1780s and 1790s, Quarenghi undertook considerable work in the Imperial Winter Palace in St. Petersburg and its adjoining complex of buildings. He built and decorated the interiors of the Hermitage Theatre (1783–87) and the *Loggie* of Raphael (1783–92), which was intended to house a copy of the Vatican's Raphael Gallery. Quarenghi was the first architect in Russia to use the amphitheatre model, which he chose for the semi-circular auditorium in the Hermitage Theatre, built along the lines of the Teatro Olimpico in Vicenza. He was well acquainted with Palladio's masterpiece, both in the original and in its interpretation by C.-N. Ledoux, copying the latter's sketches for the dancer Guimard's theatre in Paris in the 1770s. Quarenghi reproduced Palladio's popular composition of an ancient amphitheatre once again in 1780, in his designs for a public theatre for the town of Bassano, and he returned to it later for the theatres in Catherine's palace at Pella (1785) and in Count Sheremetev's palace at Ostankino near Moscow (mid 1790s). For his large theatres, Quarenghi used a multi-tiered design with stalls (the Petrovsky Theatre in Moscow, 1780s; the Bolshoi Theatre in St. Petersburg, 1802).

The hall of the Hermitage Theatre (reconstructed in 1797–98 by the architect Vincenzo Brenna) is surrounded by a classical arcade containing statues of Apollo and the nine Muses set in niches between the columns. Departing from the heroic austerity which characterized the majority of his interiors, Quarenghi created an elegant and noble decor which was in keeping with the lofty and spiritual image of the theatre as a temple to the arts. The exquisite proportions harmonize perfectly with the majestic grace of the sculptures by K. Albani and the discreet colouring of the marble facing, restricted to tranquil grey and pink tones.

Quarenghi also changed a number of interiors in the Winter Palace. At the beginning of the 1790s, he altered the large Nevsky suite, designed by Bartolomeo Rastrelli, replacing it with a new Vestibule, a Large Gallery (now known as the Nicholas Hall) and a Concert Hall, all decorated in the spirit

of a formal classicism (the rooms were all destroyed in the catastrophic fire of 1837 and restored by V. Stasov in 1838–39). The refined nature of the ensemble enabled Quarenghi to give each room a unique decor by varying similar compositions and details and gradually intensifying the decorative effect from the initial restrained decor of the Vestibule, decorated with painted panels, to the ceremonial and luxuriant Concert Hall, dominated by columns and opulent sculpture.

In conjunction with the destruction of the old, Rastrellian, Throne Room, a new extension was added onto the main building from 1786 to 1795, as part of which Quarenghi designed the Georgian Hall. In designing this magnificent and ceremonial interior, Quarenghi was guided, first and foremost, by a desire to make it the main state room in the palace. The huge peristyle (about 800 square metres), with its two tiers of windows and paired Corinthian columns is striking in its wealth of colour and delicate mixture of decorative materials – different coloured marble, stucco moulding, sculpture and painting. A *plafond* which F. Dwain and G.B. Pittoni painted from Quarenghi's sketches, and a marquetry floor containing many different types of wood, were skilfully incorporated into the compositional structure of the interior. The eminent Russian sculptors M. Kozlovsky and F. Shubin made bas-relief medallions to decorate the upper piers and statues for the corner niches. Gilt bronze girandoles and lavishly decorated stoves added to the overall effect.

From 1792 to 1796, when he was at the height of his fame, Quarenghi built the Alexandrovsky Palace at Tsarskoe Selo (now Pushkin) for Catherine II's grandson and future emperor, the Grand Duke Alexander. Although the interiors of the building underwent repeated changes and suffered damage during World War II (they were restored, 1947–49), the main suite of five halls which runs along the façade overlooking the gardens has survived. These interiors, which are drawn entirely from Palladio's orders and recommendations, are truly noble in their proportions. Quarenghi mastered to perfection the art of proportion and it became a major artistic device in all of his work. Columns and pilasters, artificial marble facing and decorative paintings by his compatriots A. della Giacomo and G. Ferrari, were all used extensively to decorate the main state rooms. The Central Hall is particularly effective, divided into three sections by broad arches and free-standing columns. The inclusion of a half rotunda set along the building's axis increases the sense of space in the room. For the palace's living quarters, Quarenghi departed from his ordered arrangements in favour of smaller architectural forms and classical mouldings around the doors and windows.

Quarenghi's most fruitful period came to an end in 1796 with the death of his main client and patroness, the Empress Catherine II. However, his high professional standing meant that he was able to continue working for the Empress's successors. Quarenghi's work for Paul I was especially important. In 1798, after Napoleon had captured Malta, the Emperor was elected to the Grand Mastership of the Maltese Order of St. John of Jerusalem (the Knights of Malta) and ordered the construction of a chapel dedicated to the Order in St. Petersburg. Quarenghi was assigned this task; he became a member of the Masonic Lodge and acted as its architect. The Maltese Catholic Chapel (1798–1800) was built in the courtyard of Rastrelli's Vorontsov Palace which was occupied by the

Corps des Pages at the time. Quarenghi created a purely Palladian interior similar to that in his earlier Church of St. Scholastica, but one which differed fundamentally in its details. The main nave of the chapel was separated from the narrow side aisles and the balcony by colonnades which led to a plain wall surrounding a semi-circular apse. The purity of the central nave, which was accentuated by a unified entablature, reflects Quarenghi's desire for his interiors to exhibit both clarity and equilibrium, while maintaining a degree of isolation. The simple, clear correlations of proportions were always highly significant in all of Quarenghi's projects.

One of Quarenghi's last great undertakings was the Smolny Institute for Women in St. Petersburg (1806–08) – a long building based on a simple plan and with plain interiors largely determined by the building's function as an educational institution. The main rooms – the classrooms and dormitories – were arranged along long corridors which stretched the length of all three storeys. On the south wing, Quarenghi built the magnificent Assembly Hall, which now ranks among the best examples of Russian classicism. Quarenghi used the compositional method of the Columned Hall in the Senate building in Moscow (1780s, architect M. Kazakov), making the classical order the central theme of his interior. The room's rectangular space sets off the immaculate and brilliant whiteness of the Corinthian colonnade. The sheer perfection of its classical proportions and the austerity of its monochrome decoration give this room a special restrained beauty that is quite unique.

Quarenghi was a man of great talent whose work in architecture was diverse and in whose interiors the decorative effects were worked out right down to the minutest detail. These included frescoes and painted wall panels, as well as friezes and vaults. The inclusion of paintings on the theme of antiquity in his interior designs was a typical device that Quarenghi turned to repeatedly for a number of rooms in the Winter Palace, the private residence of A. A. Bezborodko in St. Petersburg (1783), the palaces at Pavlovsk and Alexandrovsk, and the Zubov building at Tsarskoe Selo (1795).

Quarenghi sought an artistic unity of all the elements in his interiors and designed his own stoves, fireplaces, decorative vases and cabinets, bracket clocks, light fittings and furniture. His sketches are characterized by a fine draughtsmanship, clear forms and austere decoration. The chandeliers hanging from gilt chains, which decorate the Assembly Hall of the Smolny Institute, are unique and remain one of the few examples of Quarenghi's work in the decorative arts to have survived. When designing his furniture, Quarenghi preferred to use the traditional forms of the Renaissance, combining them with late-Roman motifs. The suite of furniture which he designed for the Maltese Chapel (a Grand Master's and episcopal chairs, plus stools, now in the State Hermitage Museum), where he used the figures of eagles with outstretched wings as supports and arm rests, is typical of his work.

MARIA L. MAKOGONOVA
translated by Charlotte Combes

Biography

Giacomo Antonio Quarenghi. Born in Valle Imagna, near Bergamo, Italy, 20 September 1744. Studied painting in Rome under the artist Anton Raphael Mengs, 1763; practised as an architect and designer of interiors during the 1760s in the studios of Antoine Derizet

(1697–1768), Paolo Posi (1708–76) and Nicola Gian Simoni; active as an independent architect, Rome, until 1779. Married 1772. Toured Italy, 1772 and 1775. Invited to St. Petersburg by Catherine II (the Great), 1779; continued to work in St. Petersburg on numerous royal commissions for Paul I and Alexander I. Returned to Italy c.1810. Died in St. Petersburg, 18 February 1817.

Selected Works

An important collection of Quarenghi's architectural drawings and designs for interiors is in the Hermitage, St. Petersburg.

Quarti, Eugenio 1867–1929

Italian furniture maker and designer

Eugenio Quarti was one of the most important cabinet-makers associated with the early phase of Italian Modernism. During the course of his career he moved away from the prevailing *florense* style, adopting aspects of the more revolutionary new trends in European design occurring around the end of the 19th century.

Quarti's knowledge of Belgian Art Nouveau is evident in the dining room he exhibited at the Turin exhibition of 1898, particularly in the sinuous volutes of the flower motif of the gilt-bronze handles, which are repeated on the lower doors of the cabinet, and on the stamped leather chairs. The walnut bedroom furniture shown at the same time displays similar details, for instance in the two small shelved cabinets which are integral with the bed. They are decorated with inlays following the grain of the wood and with elegant carving. Quarti's furniture at Turin was the only example to display a knowledge of Paul Hankar and Gustave Serrurier-Bovy's work, although it still tended towards a luxurious refinement of execution and decoration closely linked to Italian traditions of craftsmanship. In his love of rich inlay, which Quarti himself described as "incastonature" [gem-setting], there is a hint of the exoticism acquired during his apprenticeship in Carlo Bugatti's workshop, where he worked in 1888 after his return from Paris.

Around 1895 functional and practical furniture associated with the Modern Style began to be seen in Italy, and it was sometimes referred to as the "English style". The most important event in this development was the Paris exhibition of 1900 which was attended by many Italian designers eager to study the new style. Italian designers also won prizes there, including Quarti, who was awarded the Grand Prix for his piece of furniture. Its structure consisted of open shelves and closed compartments, with refined decorative techniques in lacquer and natural wood-grain, as well as carving, engraving, and metal and mother-of-pearl inlays.

While his furniture for the 1898 exhibition had recalled Victor Horta's or Henry van de Velde's styles, the bedroom he produced for the Turin exhibition in 1902 stressed simpler aspects, closer to the Jugendstil of the [Neue] Sachlichkeit. The pieces were intended to be of good quality, but affordable even for a less wealthy public. The suite was made in walnut decorated with a subtly carved frieze and gilt-bronze mounts. The faintly undulating patterns of the grain optically match the elegant mouldings loosely framing the simple shapes of the furniture. The same quality is found in the drawing room cabinet, whose elongated shape, with its acute-angled silhouette, is close to other European designs, such as those by Charles Rennie Mackintosh. Pale mother-of-pearl inlay contrasts strikingly with the dark colour of the highly polished wood. Because of the apparently ephemeral popularity of the

Stile Liberty as it was known, very few complete interiors survive in Italy, and this bedroom is one of the few remaining examples. It was used to furnish Palazzo Castiglioni in Milan.

In the first part of his career, from 1900 to 1905, Quarti used dark exotic woods such as rosewood and mahogany, encrusting them with precious materials like mother-of-pearl, silver, ivory and tortoiseshell and softening the severity of their lines with curved feet. Some of his cabinets which might otherwise have been overpoweringly massive are given an elegance through the introduction of an asymmetrical open shelf, and by the use of slender supports. It is therefore impossible to characterise these as examples of functionalism, since this was an uncommon and unpopular style in Italy; even the most open-minded of patrons preferred a number of decorative individual pieces to a complete interior.

Quarti's clients included Queen Margherita, and, among other commissions, he made her a mahogany paper-rack decorated with mother-of-pearl flowers in 1902. The rectangular open box has a curved top, on both sides of which two compartments can be opened or inserted into it.

After 1905 Quarti began to use light-coloured woods such as citron, which he inlaid along the grain of the wood in his usual manner. Often using citron with dark walnut, he achieved highly decorative effects, by contrasting their colours, such as in the bedroom furniture executed for Count Castiglioni in which the dark walnut carved borders set off the golden hues of the citron.

Quarti exhibited several interiors at the Milan Exhibition of 1906. While not abandoning simple and functional shapes, he nevertheless continued to use inlays, carving and traceries. Two details are notable in the Milan suite: the perfect line of the arm-rests and the clever device of the table top which bends to form its own support.

In addition to designing the furniture, Quarti was also concerned with other aspects of the interiors, including lamps, upholstery, doors, friezes, *boiseries*, carpets and picture frames. Working together with the architect Giuseppe Sommaruga, and with Alessandro Mazzucotelli, a specialist in wrought-iron work, in 1907 Quarti designed the Kursaal at San Pellegrino Terme. This represents a complete surviving example of his creative powers, and the chandeliers he designed there are forerunners of Art Deco.

Quarti not only used preparatory cartoons for his interiors, but also stucco models for some details of his furniture. He was a skilled draughtsman and his drawings are executed with a certain delicacy, without strong contrasts, but with the use of *sfumato* and a strong thin line.

From an early sombre Art Nouveau style, Quarti's furniture was increasingly designed in lighter coloured woods decorated with spare inlay in a style closer to Art Deco, while always preserving the solidity and tactile values of the materials.

MARIELLA PALAZZOLO

Biography

Born in Villa d'Alme, Bergamo in 1867, into a family of carpenters. Apprenticed to a cabinet-maker in Paris, 1881; returned to Italy late 1880s. Spent a short time in the studio of Carlo Bugatti (1856–1949) in Milan. Established workshop on via Donizetti, Milan. Taught at the Umanitaria Institute. Exhibited at Turin International Exhibition, 1898; at Paris Exhibition, receiving Grand Prix, 1900; Turin

Exhibition, 1902; Milan International Exhibition, winning Premio Reale and gold medal, 1906. Commissions from Milanese patrons, 1901–03, and at Pellegrino Terme, together with Giuseppe Sommaruga (1867–1917) and Alessandro Mazzucotelli (1865–1938), 1904–07, and for the Galleria, Milan, 1920. Son Mario (1901–74) continued father's business. Died 4 February 1929.

Selected Works

Quarti's archives are preserved at the Raccolta delle Stampe A. Bertarelli, Milan.

- 1901–03 Palazzo Castiglioni, Milan (bedroom furniture): Count Castiglioni
- 1902 Paper-rack: Queen Margherita of Savoy
- 1904–07 Grand Hotel, Pellegrino Terme (Kursaal interiors, together with Giuseppe Sommaruga and Alessandro Mazzucotelli, now Casino)
- 1920 Camparino bar, Galleria Vittore Emanuele II, Milan

Queen Anne Revival

Writing in 1887, the designer J. Moyr Smith declared, "the name of Queen Anne has been tacked on to things of very opposite styles, periods, and countries, with which the style of the real Queen Anne had no connection". The 19th-century revival of the Queen Anne Style was thus a highly eclectic style that was inspired not so much by a desire to revive the original architecture and furnishings of Queen Anne's reign (1702–14) as a reaction against both the philistinism of mid-century taste and the moral and aesthetic weight of the Gothic Revival. In its early stages it was predominantly an architectural movement and was proffered by the younger generation of architects in the 1870s and 1880s who perceived the secular, picturesque and aesthetically appealing qualities of the Queen Anne style as especially appropriate for the building of urban domestic dwellings. Philip Webb, Richard Norman Shaw and W.E. Nesfield led the way in developing the style in the 1860s with their interest in simple vernacular buildings, particularly those

from the late 17th and early 18th centuries. As the style evolved, however, it became closely bound up with a new artistic attitude fostered by the Aesthetic Movement that valued art and beauty for their own sakes rather than for their religious or moral sentiments, and it increasingly influenced the decoration and furnishing of interiors. Figures in the wider movement of reform in architecture and design included the well known D.G. Rossetti, William Morris, E.W. Godwin and Walter Crane, as well as many lesser known artists, architects and thinkers, such as Basil Champneys, J.J. Stevenson, E.R. Robson, Warrington Taylor, J.D. Sedding and Rhoda and Agnes Garrett. Queen Anne furnishings and decorations were also adopted by commercial "Art" manufacturers, and the style enjoyed considerable popularity among the more fashion-conscious sections of the professional classes during the last quarter of the 19th century.

In the 1860s Philip Webb began borrowing vernacular elements from the 17th and 18th centuries such as sash windows, window aprons and cut or moulded brick which he combined with Gothic pointed arches in his own individualistic way. These aspects of Webb's work can be seen in the studio house he built for Val Prinsep, now 14 Holland Park Road, Kensington of 1864-65 or at 1 Palace Green, Kensington.

Concurrently, Richard Norman Shaw and W.E. Nesfield had begun to seek out a new, more vernacular language for domestic architecture, which they first developed into the "Old English" style. This incorporated the techniques of half-timbering and tile hanging, examples of which they had sketched on their travels through Kent and Sussex. Increasingly however, their work began to adopt characteristics from the late 17th and early 18th centuries, with the use of simple red brick with white sash windows, large gables, either curved or straight, certain classical elements such as pilasters and capitals used informally, and decorative details made with cut brick or pargeting. Proponents of the style sometimes called it the "Free Classic" because of its easy interpretation of classicism in combination with a picturesque and varied skyline.

Shaw was one of the first to employ the full-blown architectural style in his New Zealand Chambers of 1871 (demolished) which created an uproar with its unorthodox use of traditional architectural elements. The building was dominated by graceful oriels of small paned glass and decorative pargeting panels between floors. Pargeting was a technique of exterior plastering in moulded designs that was found in half-timbered, vernacular architecture. While certain aspects in Shaw's work were borrowed from a classical vocabulary, such as the pediments and engaged piers, the profusion of details which covered most wall surfaces was too fanciful and delicate to be called either classical or Gothic. J.J. Stevenson's Red House, also of 1871, was equally unrelated to either style in particular. While he adopted an asymmetry from the Gothic, and certain motifs from the classical such as volutes and pediments, his treatment of them as well as his use of Dutch gables, and the sunflower motif in the ironwork, all combined into fresh and novel design.

Stevenson was one of the most vocal proponents of the Queen Anne style of building, and he defended it in several articles, as well as in his book *House Architecture* (1880). In this he argued that the Queen Anne style was a fitting and flexible style for the domestic house and more appropriate than the

Queen Anne Revival: frontispiece by Walter Crane to *The House Beautiful* by Clarence Cook, 1878

Gothic. He praised the vernacular houses of the 17th and 18th centuries as they conjured up associations of the "happy English home", suggesting an idyllic domestic retreat. Stevenson praised the Queen Anne as the stylistic solution for the modern domestic house. Neither laden with the religious associations of Gothic nor derived from the foreign tradition of the Greek temple, it was a modest and English vernacular style. As such it proved immensely popular with the urban professional classes and was used extensively in the development of several new London suburbs, notably Bedford Park.

Bedford Park was developed by a little known entrepreneur named Jonathan T. Carr. Through his marriage to Agnes Fulton he obtained the land around Bedford House, an 18th-century house set in 24 acres near the Turnham Green station. Carr took advantage of the proximity to the centre of London, and began developing the estate in the 1870s. His first architects were E.W. Godwin and the firm Coe and Robinson. Through Godwin, Carr met Maurice B. Adams, editor of the *Building News*, who was to be an important publicist for Bedford Park. Godwin designed one house for Carr, but was soon replaced by the more commercial Richard Norman Shaw in 1877. Shaw designed five houses as prototypes which were simple red-brick semi-detached or detached villas with prominent gables, cosy dormers, white-trimmed windows, balustrades and decorative details in cut or moulded brick. He

also designed Carr's own house, called Tower House, and the local church and inn. The church, St. Michael's and All Angels, of 1879, blends in well with the growing suburban development around it, by combining vernacular Gothic and Renaissance elements. Across the street, Shaw's Tabard Inn is part of a larger building which includes a small shop, and a house. It was in the same Queen Anne style with red brick, bay and oriel windows and a tall range of gables along the façade. The interior was decorated with William Morris wallpapers and tiles designed by William De Morgan and Walter Crane, and the frequency with which Morris's patterns appeared in other Bedford Park houses prompted one contemporary commentator to suggest that the firm would be well-advised to open a showroom in the area.

A more bohemian Queen Anne community grew up in Chelsea, along Tite Street. During the 1870s and 1880s the residents of Tite Street included J.M. Whistler, Oscar Wilde, John Singer Sargent and W.S. Sickert as well as their lesser known followers. The most important architect involved in the development of the street was E.W. Godwin. His designs for Whistler's house, which came to be called the White House, at 35 Tite Street (demolished), and a house designed for the artist Frank Miles at 44 Tite Street, were extremely controversial.

In the first design for Whistler's house of 1877, Godwin exploited the front of the huge roof of green slate (which concealed a large studio within), by leaving the whole an untreated blank area interrupted only by a simple dormer. The mouldings around the windows and doors were kept simple, the most elaborate decoration being reserved for the entrance door. The composition is irregular and comparatively stark and proved unacceptable to the Board of Works, which made Whistler promise to add more decorative detailing and reduce the blank space of the roof. Although some alterations were made, the carved relief panels ordered to appease the Committee were never added.

Even more shocking for the Committee of the Board of Works were Godwin's designs for 44 Tite Street. Here the gracious curves of the Queen Anne style were entirely omitted and the façade was reduced to a series of rectangles arranged with a free but balanced irregularity. This modern design with very little ornament was unacceptable to the Committee until Godwin added a curving Flemish gable over the double windows in the dormer, filled in the blank window spaces with delicate panes of glass and embellished the entrance.

In both of the designs Godwin was experimenting with colours and shapes independent of historical styles in a way that closely paralleled Whistler's ideas about painting. The houses mark a step away from the Queen Anne style in architecture, which was based on an eclectic blending of styles but which did not abandon accepted architectural language and ornament. Most Queen Anne architects continued to look backwards in time for inspiration, while Godwin was looking forward.

Other houses built in Tite Street faced much less criticism as they were designed in a more orthodox and acceptable version of the Queen Anne style. Areas of Chelsea such as the Cadogan estate, were developed in the style with blocks of large red-brick town houses, enlivened by white sash windows, balconies and curving window aprons. The Borough of Hampstead in North London also became predominantly

Queen Anne with houses by Shaw, Basil Champneys, Webb and Stevenson. Shaw's own house in Ellerdale Road was a particularly fine example whose interior details demonstrated a historical eclecticism that was typical of the style. The drawing room, for example, contained a late 18th century-style chimneypiece but fitted with a low overmantel for china and lined with brightly coloured De Morgan tiles, an Elizabethan-style plasterwork frieze, and predominantly 18th-century furnishings and numerous oriental rugs. The large dining room had a more Renaissance flavour. It had an "Old English" inglenook, exposed ceiling beams and bolection-moulded panelling, and was decorated with an embossed leather paper. The artistic community in Holland Park, overseen by Lady Holland, her son Val Prinsep and the artist Sir Frederic Leighton, included a number of red-brick studio houses for Luke Fildes, Marcus Stone and Colin Hunter, designed by Shaw and Stevenson, with large windows trimmed in white and decorative curving gables. Other notable examples of Queen Anne style architecture were J.J. Stevenson and E.R. Robson's London Board Schools designed from the 1870s and Champneys's Newnham College, Cambridge, which developed through the 1870s, 1880s and 1890s.

Queen Anne interiors were rarely as stylistically consistent as their exterior counterparts and included decorations and furnishings drawn from many different periods and styles. Inspiration might be drawn from the English decorative tradition from the 15th to the early 19th century, from Greece and Japan, from the Italian Renaissance and from contemporary aesthetic fashion, and the mixture of influences was often extremely eclectic. Exotic features such as Japanese prints, screens and fans, oriental and Dutch blue and white china, Hispano-Moresque plates, Turkish tiles and Persian carpets were especially popular, as were Chelsea and Worcester porcelain, 18th century-style furnishings and various antique *objets d'art*. Walls and ceilings were decorated with "Art" wallpapers containing stylized floral or foliate designs and complex pelmets and stiffly arranged draperies were replaced with embroidered or woven textiles hung from poles in loose folds. Novel features included windows with small panes on either side of a central arch, doors with broken pediments, window seats, wooden overmantels incorporating circular mirrors, and a plethora of shelves and brackets for the display of artistic bric-à-brac, pots, feathers and fans.

If the density of objects in these rooms might ultimately lead to a somewhat cluttered effect, the aim was to control and unify the contents through subtly co-ordinated color-schemes. The bright primary colors of the mid-century were increasingly abandoned in favor of tertiary shades, in particular greys, greyish-blues, bluish-greens, yellows, soft pinks and browns, with accents of dull gold. Such shades can be seen in many of the wallpapers manufactured by companies such as Jeffrey & Co. and William Woollams & Co. from the late 1870s and they also appear in contemporary decorators' handbooks, like T. Knight & Sons' *Suggestions for House Decoration* (1880) which contains illustrations of wall treatments and complete rooms designed by J.D. Sedding.

Many of the contents of Queen Anne interiors were made by the new breed of "Art" decorators and manufacturers that emerged in the 1870s and 1880s in response to the more widespread public interest in artistic effects. The first of these firms

was Morris, Marshall, Faulkner & Co., founded in 1862, but by the last quarter of the century many other older established firms were also describing themselves in this way. Much of their work was designed by architects: Shaw designed furniture for Aldam Heaton, T.E. Colclutt designed furniture for Collinson and Lock, E.W. Godwin designed wallpapers for Jeffrey's and furniture for Gillow's and William Watt and Co., R.W. Edis designed furniture for Jackson and Graham, and Thomas Jeckyll designed metalwork for Barnard, Bishop and Barnard.

Queen Anne furniture generally derived from 17th- and 18th-century precedents, the latter often vaguely classified as "Chippendale" and "Sheraton". Early examples were sometimes ebonized or painted green, but lighter woods, such as rosewood, were increasingly favoured from the late 1870s. Many pieces were quite architectural in character and incorporated details that echoed the forms of Queen Anne buildings. Display cabinets and corner cupboards, for example, frequently featured broken pediments, curved gable ends, dentil ornamentation and urns, bow fronts and doors with Chinoiserie glazing or fretwork. Legs were often delicate and light, giving the furniture a somewhat spindly appearance, and the emphasis was upon tall, vertically-designed pieces that rose high up the wall. While many of these items appear contrived and exaggerated, the Queen Anne style also encouraged the use of simpler and more practical features such as built-in furniture and Morris and Co.'s *Sussex* chair. Based on a vernacular late 18th century example, the *Sussex* chair was versatile and lightweight and its sturdy yet delicate design meant that it blended in well with the eclectic furnishings and decorations favoured in Queen Anne houses.

Described by the *Cabinet Maker* in August 1880 as "the prevailing style of the day", the Queen Anne style represented a less extreme alternative to the more radical Aesthetic and Arts and Crafts styles, and proved extremely popular among those sections of the middle classes with artistic leanings. Architecturally it was charming and picturesque, internally it allowed for great variety, and it could be used for town houses, semi-detached houses and independent villas. Without the historical associations of religion and morality, the style was appreciated by those who rejected the values of their parents and the Gothic Revivalists. It filled a niche in domestic housing and decoration, providing for the aesthetic wants of the inhabitants while advertising the merits and values of the "happy English home".

Quilts and Quilting

A quilt is a textile sandwich usually made of three fabric layers held together by stitching. It consists of a top which is decorative, a wadding (batting) in the middle, and a backing which can also be decorative. A flat quilt has both aesthetic and utilitarian values: it can be used as a bedcover, a "throw" or a wallhanging. "Quilting" is the stitching, usually a small, even, running stitch which can be used both to create a design, and to enhance it. Because it binds layers together, quilting creates a thick and less penetrable fabric and is therefore used to retain warmth and offer protection.

There is evidence to suggest that quilting has been used on armour, ceremonial robes and furnishings for more than 3,000 years, but its precise origins are obscure. The earliest surviving example of quilting was found on a carpet discovered on the floor of a tomb in northern Mongolia and is thought to have been made between the 1st century BC and the 2nd century AD. Other early examples of quilting derive from the Middle and Far East and appear in armour, clothing and flat pieces that could be used as cloaks, wall-hangings, bed-covers or mattresses.

The craft of quilting seems to have been introduced to Britain by returning Crusaders during the late Middle Ages when quilting appeared on armour rather than upon covers or furnishings. Documentary evidence for quilted bedcovers appears in inventories dating from the 17th century. During this period quilting became increasingly popular and was also used as decoration on a wide variety of clothes, particularly women's petticoats, men's waistcoats, and children's caps and baby-clothes. Elaborately quilted bedcovers became more common during the 18th century and early examples often had grounds flat-quilted in cream or yellow silk. Other single-colour, silk and linen furnishings were also worked with yellow silk in both padded and flat quilting. The majority of these items were professionally made and were used in aristocratic interiors as were a growing number of Indian chintz quilts. But as the popularity of these items grew, home-made wadded quilts were increasingly used as decorative covers in working-class homes.

Another technique frequently associated with quilting that grew in importance during this period was patchwork. Patchwork was first used in the late 17th century and the early-

est set of patchwork hangings in England are those at Levens Hall, Westmorland, which date from 1708. It flourished within wealthy homes in Britain in the late 18th and early 19th century, then fell into disrepute as a rustic craft until it emerged in the second half of the 20th century as an art form. Late 18th century patchwork was generally applied; the design was made up of pieces of different shapes and sizes that were sewn onto a ground fabric. During the 19th century this technique was replaced by pieced patchwork which consists of regularly shaped pieces sewn together so that they make up the fabric; the hexagonal pattern frequently found in Victorian bed-covers is a typical example of this style of work. Another variation fashionable in the second half of the 19th century was "crazy" patchwork where scraps of unrelated fabrics, silks and ribbons were sewn onto a backing – usually silk or velvet – each shape being outlined with feather stitching in thick silk. Crazy patchwork was frequently used for quilts, table-covers, and small decorative items such as cushions.

Styles of quilting were quite varied during the 19th century. Two-colour block patchwork, strip quilts and multi-coloured medallion quilts were common and were made up from Victorian sprigged prints and large-scale chintz designs. The mechanisation of cotton-printing meant that from the early 19th century small calico and larger floral prints could be purchased cheaply and no longer needed to be salvaged from existing dress or furnishing fabrics. "Wholecloth" quilts with quilting designs applied to them by specialist designers, "strippy" quilts made of two colours, and Medallion quilts were also very popular in Britain, as were hexagonal and crazy patchwork designs.

Quilting was also used for bedding and clothing in other parts of Europe. Light-weight, all-white quilts featuring *trapunto* cordwork and padding became particularly popular in the late 18th century as they were well-suited to Greek Revival and Empire furnishings styles. The oldest known surviving bed quilt is Sicilian and dates from c.1400; it was made of linen and padded with wool. It is probable that these decorative but thin covers were favoured and produced in warm areas such as Italy and Spain.

Today the tradition of quilting is most often associated with the United States. But although Americans have clearly developed quilt-making and have created a distinctive indigenous style, the original quilt-makers were immigrants and it is the diverse styles, shapes and use of colour that they brought with them from all over the world that has contributed to this modern American idiom.

The major difference between the early American quilts and others has been in the formation of the quilt top. The Americans started to create quilt tops by making a number of identical fabric blocks and piecing them together to create a design, usually geometric. Some historians consider that the American block method developed through the pioneer women who had limited space and time, and little money or opportunity to purchase fabrics, but were in need of both warmth and protection. Their quilts were used not only as bedcovers but also to line their wagons and create a barrier against Indian arrows. The method of making blocks from scraps and only assembling the covers when all the blocks were completed was possibly more suited to the cramped living circumstances of these women. The varied materials used in

these quilts, such as pieces of sugar- and flour-sacks, as well as remnants from bridal gowns and baby clothes have helped identify the origins of the makers. Quilts made by pioneer women have been used to help track some of the patterns of migration to California and represent women of all classes, ethnic groups and time periods. Well known pattern names associated with these block quilts include *Road to California*, *Shoo Fly* and *Bear's Paw*.

Other strongly identifiable American styles include the quilts made by the Amish people, and Baltimore Album quilts.

Traditional Amish quilts are immediately recognizable through their unusual and striking use of solid colour. They also boast some of the most superb examples of quilting and, when hung, can resemble abstract paintings. The quilts reflect the strong values of members of the Amish communities. They suggest a strong work-ethic, the high regard for good quality work, and art with useful purpose. Contemporary Amish quilts are less distinctive. Often made for commercial purposes, they may feature printed fabrics and less dense quilting. An applied use of colour aimed to please the "market" has removed the naive quality of colour that is part of the older quilts. An increased interest in quilting has also meant that these designs are copied. Well known designs associated with the Amish are *Diamond-in-a-Square*, *Bow-Tie* and *Nine-Patch*.

An "album" quilt generally suggests that each block has a different maker. The makers are often members of a family or a particular group such as a church or club. Most album quilts were made to commemorate special events, such as the Civil War, the erection of some monument or building, or more personal events like the marriage of a group member. Historic Baltimore Album Quilts are among the most flamboyant examples of this style and offer the viewer information on national history and the personal lives of the makers. They are always made of appliquéd blocks, often extremely complex and colourful in design and expensive in construction. Fine chintzes are used for *broderie perse* work which is characteristic of this style which was influenced by German immigrants. A typical "Baltimore" will have 25 different album blocks, each probably 16 inches square, and a deep border adorned with either some form of vine or elaborate pattern of swags and bows. The most famous known designer of this kind of quilt is Mary Evans (1829–1916) who is considered to have made some of the most ornate blocks, including those depicting abundantly filled baskets of flowers and cornucopias.

The ongoing international quilt revival can be directly traced to the exhibit *Abstract Design in American Quilts* held at the Whitney Museum of American Art in New York in 1971. The result of the exhibit was the transfer of the quilt from the bed to the wall, thereby altering its utilitarian character and transforming the quilt from a quaint item of "folk art" to a design object. A new "Quilt Fever" hit America. Artists as well as needlewomen became caught up in the production of this "new" media. Yet this revival does not reflect other quilt revivals. Although old designs are still being made, and continue to offer inspiration, new techniques, materials and ideas have developed far beyond the dreams of the pioneer women. Contemporary quilts are continuing to convey powerful messages of emotion and political concerns. Most importantly, a major new industry has emerged, employing textile and quilt designers, artists and teachers.

Contemporary quilt artists all over the world are producing work that bears little resemblance to classical and folk-art examples. Their materials are varied and encompass modern technology as well as paint, photographs, text and metals. In turn, these modern artists are influencing the growing numbers of quilt-makers in countries such as Australia, Finland, France, Germany, Japan, South Africa, Switzerland, the United Kingdom and the United States. In America contemporary quilts are considered an art form and old quilts in good condition have become desirable collectors' pieces. Quilt artists such as Pauline Burbridge (UK), Nancy Crow, Michael James and Lia Cook (US) are now represented in many major international public art collections. In the United States quilt artists are also commissioned to create large pieces as hangings for public and commercial settings such as city halls, hospitals, banks and corporate collections. This development is not yet fully reflected elsewhere.

MARLENE COHEN

Selected Collections

Many American museums have large collections of quilts. Major holdings can be found in the Maryland Historical Society, Baltimore, the Los Angeles County Museum of Art, the Winterthur Museum, Delaware, the Metropolitan Museum of Art, New York, the Shelburne Museum, Shelburne, Vermont, and the Smithsonian Institution, Washington, DC. Important British collections include those at the American Museum, Bath, the Bowes Museum, Barnard Castle, Co. Durham, and the Victoria and Albert Museum, London.

Raphael 1483–1520

Italian painter and architect

“How beautiful and benign Heaven sometimes shows itself in showering upon one single person the infinite riches of its treasures”, wrote Vasari of Raffaello da Urbino (Raphael), who was revered as the prince of painters and who lived like a prince at the height of his success in Rome. Born in 1483 in Urbino where his father, Giovanni Santi, was court painter to the Dukes of Urbino, the young Raphael was apprenticed in Perugia to the painter Perugino who, around 1500, was engaged on a programme of frescoed decorations for the Audience Hall of the Cambio. The walls and ceiling are painted with Christian and Classical subjects, among which Raphael is credited with some of the figures; one, of Daniel, is traditionally a self-portrait. By 1504 he was in Florence, and possibly in Siena where Pinturicchio was working on the frescoes in the Piccolomini Library. While in Florence he came under the influence of Leonardo and Michelangelo, both of whom were employed on decorations in the Palazzo Vecchio.

In 1508 Raphael arrived in Rome where Julius II had begun to build a new St. Peter's with Bramante as the first of many architects. It was the latter who recommended Raphael to the Pope as the painter of a suite of apartments or *stanze* in the Vatican, and his appointment seems to have given him carte blanche to cover over work already done by other artists, even though his only previous experience of fresco-painting had been on a minor scale compared with the new commission. The architectural perspectives which are an important element in several scenes, notably *The Expulsion of Heliodorus*, *The Mass of Bolsena* and, above all, *The School of Athens*, may have been a collaboration with Bramante, who probably advised on the design of the centrally-planned, domed temple in Raphael's painting, *The Marriage of the Virgin*, in the Brera Gallery, Milan. The coffered arches of *The School of Athens* and the central domed space are close references to Bramante's intended, but not executed, design for St. Peter's. Work on the *stanze* and other parts of the Vatican was to continue for the rest of Raphael's short life, but there were other important decorative commissions.

One came from Agostino Chigi, the papal banker, for whom Baldassare Peruzzi had designed a riverside villa (later known

as the Farnesina) in the Trastevere district of Rome, in which he himself painted a number of the rooms. Peruzzi and Sebastiano del Piombo decorated the garden loggia with references to the signs of the zodiac and to air; then in 1513–14 Chigi engaged Raphael to paint a panel, in what Vasari calls “his softest manner ... a Galatea in a car on the sea drawn by two dolphins, and surrounded by Tritons and many sea-gods”. The arches of the loggia remained open until the middle of the 17th century when they were closed in and the remaining undecorated parts were painted by Giovanni Paolo Marescotti and Gaspar Dughet. Peruzzi and Sodoma carried out more, increasingly illusionist, decoration in other rooms; and then, around 1518, Raphael was brought back to decorate the vault of the entrance loggia. According to Vasari, he “made all the cartoons, and he coloured many of the frescoes with his own hand”, but probably most of the work was executed by Giulio Romano and Giovanni Francesco Penni. The illusionistic design of the then-open loggia was intended as a transition from the garden to the villa, with painted Nature, birds, greenery and garlands. Psyche's reception by the gods on Olympus is the main theme, but Vasari notes the “many scenes from the poets” in the spandrels, and “many most beautiful little boys in foreshortening, hovering in the air and carrying all the instruments of the gods”. Festoons of flowers and fruit were painted by Giovanni da Udine as frames to the scenes. Some of the intended effect has been lost, partly by closing in the loggia, and partly by overpainting added in the 17th century, as well as by the absence of the intended wall tapestries.

According to Pirro Ligorio, ancient Roman frescoes then visible in the Esquiline were Raphael's source for many of the ideas in Chigi's garden loggia. The discovery of these and other decorations in what had become underground rooms resembling *grotte* inspired Raphael and his contemporaries and introduced a new freedom of expression in painted and stucco decoration. The use of *grotteschi* became a characteristic of their work, as may be seen in the rooms Raphael was decorating for Cardinal Bibbiena in 1516, including a bathroom in which Venus was the presiding deity. By this time Bramante had died and Raphael had been appointed *magister operis* of St. Peter's, sharing the duties with Fra Giocondo and with Giuliano da Sangallo who was *operis administer et coadiutor*. In addition to his painting and decorative commissions, he had been carrying out a number of architectural works. In the Vatican, according to Vasari, “besides embellishing the Palace

greatly with grotesques and varied pavements, he also gave the designs for the Papal staircases, as well as for the *loggia* begun by the architect Bramante, but left unfinished on account of his death, and afterwards carried out with the new design and architecture of Raffaello, who made for this a model of wood with better proportion and adornment than had been accomplished by Bramante”.

Raphael was also commissioned to design the stucco ornaments, the painted panels and the grotesque decoration for which the loggias are renowned. Giovanni da Udine was in charge of the execution of this work, placed at the head of a team of painters; of the result, Vasari wrote that “with regard to the paintings, the stucco-ornaments, the arrangement, or any of the beautiful inventions, no one would be able to execute or even to imagine a more marvellous work”. But although the overall conception and design were Raphael’s, there were considerable contributions by his assistants who had become used to working in his manner; ironically, engravings of the loggia decoration, which were published from Raphael’s time onwards into the 19th century, continued to be the source of versions of what proved to be among the most influential decorative schemes of all time. Of these, possibly the finest was the suite published in Rome by Marc Pagliarini c.1769–77 with engravings by Giovanni Volpato and Giovanni Ottaviani after drawings by Pietro Camporesi and Ludovico Tesco.

Raphael’s final architectural and decorative commission was the Villa Madama, a suburban Roman residence for Leo X and Cardinal Giulio de’Medici (later to be Pope Clement VII). Construction began in 1518, but only a part was ever built. Raphael’s death in 1520, followed within a year by that of the Pope, halted the work, and although Clement VII renewed activities in 1524 the Sack of Rome three years later brought damage to the unfinished building. It was left as a fragment only of what would have been a major work. The finest decoration is in the vaulted, domed loggia where Giovanni da Udine did the stuccowork and Giulio Romano the painting, with Peruzzi’s assistance. This is the apogee of the grotesque. The relationship between the spatial and decorative elements has been created in masterly fashion; it also seems to have set the iconographic fashion for incorporating the four Elements and the four Seasons in Roman villa decoration.

Raphael was buried in the Roman Pantheon. More than any other artist of the Renaissance he had reinterpreted Antique art, not only in architecture but in decoration. His influence has been profound on later generations, especially on Neo-Classical architects and artists whose decorative styles owed much to his vision of the past.

Biography

Raffaello Santi or Sanzio. Born in Urbino, 6 April 1483. Trained under his father, the painter Giovanni Santi. Worked in Perugia and Città di Castello as partner to the painter Perugino (c.1450–1524), 1500–04. Working in Florence, c.1504; moved to Rome in 1508. Dominated artistic life in Rome until his death in 1520, working in

all fields of painting, architecture, interior decoration and tapestry design. Succeeded Bramante as architect for the new St. Peter’s, 1514. Died in Rome, 6 April 1520.

Selected Works

The most important cycles of Raphael’s interior decorations are at the Vatican Palace, the Villa Farnesina, and the Villa Madama, all Rome. The Sistine Chapel tapestry Cartoons are in the Victoria and Albert Museum, London.

- 1508–20 Stanze, Vatican Palace, Rome (frescoed decoration): Popes Julius II and Leo X
- 1510–20 Villa Farnesina, Rome (*Galatea*; Loggia of Psyche; stables): Agostino Chigi
- 1515–16 Cartoons for tapestries for Sistine Chapel: Pope Leo X
- 1516– Palazzo Pandolfini, Florence (building and interior frescoes after Raphael’s designs executed by Giovan Francesco and Aristotle Sangallo)
- 1517–18 Vatican loggias and loggetta, Rome (grotesque decoration completed by pupils): Pope Leo X
- 1518–20 Villa Madama, Rome (grotesque decoration completed by pupils): Cardinal Giulio de’ Medici

Rastrelli, Bartolomeo c.1700–1771

Russian architect

Francesco Bartolomeo Rastrelli is renowned in the history of Russian architecture as the founder in the mid 18th century of the mature Baroque style. As court architect to two successive empresses, Anna and Elizabeth, he established himself as the leader of the movement during the 1740s and 1750s. His clients ranged from Tsars and nobles to lesser dignitaries, for whom he designed, built and lavishly decorated magnificent palaces and splendid temples.

Rastrelli's style developed under the influence of Italian Baroque, French Classicism and Rococo. He was greatly indebted to his father, the architect and sculptor Bartolomeo Carlo Rastrelli (1675–1744) from whom he acquired a grounding in his craft. The first tentative steps which the young Rastrelli took in the field of art and design were linked with works of a decorative nature. Among these were alterations to the interiors of Shafirov's house in St. Petersburg (1722–23, destroyed), the interiors of the palace of the Moldavian D. Kantemir in St. Petersburg (1721–27, rebuilt) originally built by B.C. Rastrelli, and the Winter (1730) and Summer (1732) palaces in Moscow (destroyed).

The third Winter Palace, built by Rastrelli for the Empress Anna in St. Petersburg (1732–35, demolished) and the palaces built for her favourite Duke, Ernst Johann Biron of Courland, in Mitau (now Yelgava, Latvia, 1735–40, rebuilt) and Ruentale (now Rundale, Latvia, 1735–40) are important for establishing Rastrelli's decorative style. Of all these works, only the palace in Ruentale survives in its original form. The influence of early French Rococo is clearly evident in its internal decoration and the decor is very restrained. Rastrelli's skill in designing formal state interiors is already apparent in these palaces, which demonstrate those spatial and artistic solutions to problems of form which he was to develop so brilliantly in the future. Large main halls, which take up the whole width of the building, with huge windows on both sides and narrow piers, were typical of his work, as were large friezes that helped to smooth the transition from wall to ceiling, and the clear construction of planes and the symmetrical arrangement of square rooms. The organisation of the internal space was subjected to a strict rectilinear treatment of the state rooms and living quarters, which were designed to hold magnificent receptions and state ceremonies.

In the second half of the 1740s, Rastrelli entered a period of creative maturity and was very successful, receiving commissions from the Empress Elizabeth and leading magnates. The palace of Baron S.G. Stroganov (1752–54) in St. Petersburg is one of the best examples of the Rastrellian style in a private palace. Only the White Ballroom remains as evidence of the splendid decoration of the rooms that once made up the suite on the first floor. Here, as earlier in the Throne Room of the Winter palace, a dais for the orchestra was introduced into the composition of the interior.

Rastrelli's greatest achievements were the Imperial residences at Peterhof and Tsarskoe Selo outside St. Petersburg, which he rebuilt completely for Elizabeth. The splendid and lavish decoration of these magnificent palaces demonstrates clearly Rastrelli's powers of artistic expression and the extent

Rastrelli: staircase, Summer Palace, Peterhof, St. Petersburg, 1745–52

of his creative skills. A seemingly unending array of magnificent state rooms unfolded behind their gigantic façades (the palace at Tsarskoe Selo is more than 325 metres long), extending from the main entrance in one of the side pavilions to the palace chapel which formed the last component in the composition. Although similar methods were used in planning and designing the interiors of the two palaces, they differ considerably in their details.

The comparatively free planning and the light and playful decor were in keeping with the pleasurable nature of the Summer Palace at Peterhof (1745–52), which was used primarily for court entertaining and holidays. Although repeated changes have altered the appearance of many of the interiors, their general composition and the design of the main rooms – the staircase, chapel, ballroom and the audience chamber – have been preserved (the original interiors were destroyed during World War II and renovated from the 1950s to the 1980s). Baroque and Rococo characteristics determined the style of the internal decoration. A passion for a strong, sculptured decor, which is especially evident in Rastrelli's later works, combines here with the illusion of a light and transparent interior.

The majority of the main rooms at Peterhof, the most important of which take up the whole width of the building, had two tiers of windows. The walls were decorated with elegant pairs of pilasters and tall mirrors, above which hung oval murals. False doors and fake plate-glass windows helped to maintain the symmetry, and gleaming mirrors filled the interior of the palace with a sense of light and air so that it seemed palpably larger. The decorated *plafonds* with their allegorical compositions, rising colonnades and vaults, their flying figures and soaring clouds, had the effect of visibly extending the ceilings, creating an illusion of endless space.

The impression of gradual movement is intensified through

the asymmetry of the gilded wooden carvings and mouldings which form the main decorative elements within Rastrelli's interiors. The ornamental surrounds of the panels, mirrors and murals, and the door cases shine against the white background of the walls and doors, making the decor seem integral and complete. Rastrelli's rich imagination shows through in his masterly treatment of the Rococo decoration – there is not one garland in Peterhof that is a replica of another.

Unlike the masters of French Rococo, Rastrelli readily introduced order into his interiors, and this helped to define the stately architectonic nature of the decoration in the Great Palace at Tsarskoe Selo, the official summer residence of the Empress Elizabeth (1752–62, partially rebuilt). Creating a Russian Versailles, Rastrelli subordinated the organisation of the internal space to the court ritual of the Empress's "grand entrance". A hall with two tiers of windows and the main staircase marked the beginning of the palace's state rooms. From there a staggering array of luxurious halls and studies opened out. The immense scale and saturated decoration of the five main halls – the anterooms – which together formed a structural entity and culminated in the dazzling White Hall, marked the pinnacle of Rastrelli's achievements in interior design. The state rooms then divided into the drawing rooms and the Empress's private quarters.

Although the interiors at Tsarskoe Selo are at times decorated to excess, Rastrelli's style actually takes on a more solemn and tectonic character here. The grandiose nature and power of the almost sculptural forms is very impressive, the picture frames are arranged in strict symmetry to break up the walls, and the sense of order created by the colonnades and pilasters has a most regenerating effect. All of this makes the interiors resound with echoes of the Baroque. The copious carvings, with their skilful changes from the low relief of Rococo decoration to the high relief of the allegorical figures, are subordinated completely to a precise compositional structure of the surface plane, and the rich decoration in turn is subordinate to the monumental character of the whole ensemble.

At the same time, the palace contains interiors that are much more intimate in character. One of these is the Chinese Hall, where Chinese lacquered panels, silks and fantastic stylized fretwork all served as a backdrop to a collection of Meissen china. The famous Amber Room deserves special mention. Amber panels from the study (1709, A. Shluter), which were given to the Russian Emperor Peter I at the beginning of the 18th century by the King of Prussia, Friedrich I, were used to decorate it.

Rastrelli also completed three pavilions in the park at Tsarskoe Selo – the Grotto (1749–61), the Hermitage (1743–54) and Monbez (‘‘Mon Bijou’’) (1750–52, demolished). These are distinguished by a greater sense of freedom and lightness than were exhibited in the decoration of the palace itself. This did not mean, however, that they were any less magnificent. The large hall in the Hermitage, equipped with a special mechanical device so that the dining tables could be changed, is typical of architecture of the time.

The principles of planning and the artistic methods previously developed by Rastrelli and employed at Peterhof and Tsarskoe Selo came together in the project that marked the culmination of all his creative endeavours – the emperor's

Winter Palace in St. Petersburg (1754–62). The four corners of the building – a square with a large inner courtyard – housed the main staircase, the Throne Room, chapel and theatre. They were joined by a suite of rooms whose original decoration was destroyed during a catastrophic fire in 1837. Restoration work on the chapel and staircase, unquestionably a masterpiece of Rastrelli's art, was originally begun by the architect V.P. Stasov in 1838–39 and continues to this day.

Like most of his contemporaries, Rastrelli drew up designs for furniture, and these formed part of the overall design of his palace interiors. Stylistically akin to French Rococo forms, the carved consoles and armchairs arranged along the walls were a unifying factor in all the halls. Rastrelli sought to perfect his own designs right down to the smallest decorative detail. Even the floor designs were drawn up by him and he chose the different types of wood to be used. The work was then carried out by numerous painters and artists using Rastrelli's sketches and drafts. Among others, the artists I. Vishnyakov, I. and A. Belsky, B. Tarsia, A. Triskorny, D. Valerian, A. Perezinotti, P. and F. Graditski, P. Ballariny and L. Bemer worked with Rastrelli.

Church decoration occupied a special place in Rastrelli's work. The originality of his designs stems from the combination of a solemn sense of ceremony and secular decoration, characteristic of the palace interiors, with the traditional forms of Russian cult architecture and decoration. Apart from the court chapels, situated at the end of a long line of magnificent rooms at Peterhof, Tsarskoe Selo and in the Winter Palace, Rastrelli designed two cathedrals – the Cathedral of St. Andrew in Kiev (originally designed in 1747 and built by the architect I.F. Michurin from 1747–52) and the Smolny Convent in St. Petersburg (1749–62). The internal decoration was completed by the architect V. P. Stasov in 1833–35, but the magnificent result preserved Rastrelli's ideas. The decoration of the chapel at Peterhof is characterized by a sense of restraint, which is particularly noticeable when compared with the splendid chapel at Tsarskoe Selo, where the flat ceiling with a *plafond* painted by D. Valerian makes it resemble even more closely the main rooms in the palace.

In all his church designs, Rastrelli used a form based on a central five-domed structure with cupolas arranged in the shape of a cross, which he then interpreted in his own original way. In the Cathedral of St. Andrew and the Smolny Convent, only the central dome lets light in, while the domes on the side are blind and ornamental. The huge domed vault on a high and light drum is supported by massive pillars surrounded by half-columns. All the decorative features are subordinated to a system which articulates the architectural elements.

Rastrelli's art cannot be confined within the bounds of the Baroque, but neither does it belong entirely to the Rococo period. He demonstrated great skill in employing a wide variety of artistic means and compositional methods, and developed his own unique and brilliant creative programme, exerting a powerful influence on the development of Russian interior design in the mid 18th century.

The death of the Empress in 1761 marked the end of the Baroque era and the beginning of the enforced establishment of classicism. Following his dismissal a year later, Rastrelli went to work at Courland for Biron, where he decorated a number of rooms in the palace at Ruentale. The small number of

Rastrellian interiors from this period are decorated to excess and are evidence of a decline in the creative work of a master who had outlived his own style.

MARIA L. MAKOGONOVA
translated by Charlotte Combes

Biography

Francesco Bartolomeo Rastrelli. Born in Paris, c.1700, the son of the architect and sculptor Bartolomeo Carlo Rastrelli (1675–1744). Studied with his father and accompanied him as his assistant to St. Petersburg, 1716; possibly also studied in Paris under Robert de Cotte (1656–1735), 1725–30. Active in Russia by 1730; appointed court architect 1738; demoted after the fall of Biron, 1740; reinstated by the Empress Elizabeth I and active in court circles, 1741–61. Visited Italy c.1763 and 1769. Member, Academy of Arts, St. Petersburg, 1771. Died in St. Petersburg, 1771.

Selected Works

A large collection of drawings relating to Rastrelli's work at Tsarskoe Selo and the palaces of St. Petersburg is in the National Library, Warsaw. Additional drawings are in the Hermitage, St. Petersburg.

Interiors

- 1732–35 Third Winter Palace, St. Petersburg (building and interiors)
- 1735–40 Biron Palace, Mitau (building and interiors)
- 1735–40 Biron Palace, Ruentale (building and interiors)
- 1741–44 Summer Palace, St. Petersburg (building and interiors)
- 1743–57 Vorontsov Palace, St. Petersburg (building and interiors)
- 1743–54 Hermitage, Tsarskoe Selo (building and interiors)
- 1744–50 Razumovsky (now Anichkov) Palace, St. Petersburg (completed Zemtsov's building and interiors)
- 1745–52 Summer Palace, Peterhof, St. Petersburg (renovation and enlargement of the building, and interiors including the Great Hall, Ballroom and State Apartments)
- 1750–52 Mon Bijou Pavilion, Tsarskoe Selo (building and interiors)
- 1752–56 Grand Palace, Tsarskoe Selo (renovation and interiors including the grand salon, chapel, dining room, picture gallery and Visitors' Room in White)
- 1752–54 Stroganov Palace, St. Petersburg (building and interiors)
- 1754–62 Fourth Winter Palace, St. Petersburg (building and interiors)
- 1755–61 Grotto, Tsarskoe Selo (building and interiors; completed by Antonio Rinaldi)

Rateau, Armand-Albert 1882–1938

French architect and designer of furniture and interiors

Armand-Albert Rateau was one of the most innovative and idiosyncratic French designers of the 1920s and 1930s, but he remains one of the least known, since he did not show work at any of the Paris Salons and thus forfeited the public exposure gained from annual exhibitions and press coverage. He worked for a small group of prominent and exceedingly wealthy private clients and latterly secured several prestigious French government commissions to decorate and refurbish Ministry offices and foreign embassies. His style is difficult to define; Alastair Duncan (1990) describes him as a "Neo-Classical Modernist" owing to his interest in Greek and Roman antiquity, to distinguish him from the "traditional-Modernists", Leleu and Ruhlmann, who drew inspiration from the *ébénistes*, or Court cabinet-makers of the 18th century. Olivier-Vial (1992) subtitles the monograph he wrote with the designer's son, François, *Un Baroque chez les Modernes*, alluding to the richly patterned surfaces, fashioned from rare and expensive materials using laborious techniques, which characterized his entire production from mural decoration to the construction of individual pieces of furniture and accessories.

In 1905 Rateau was appointed artistic director of the decorating company, Alavoine & Cie. where he designed boutiques for the jewellery companies, Tiffany and Boucheron, and made some important contacts, notably with members of the English aristocracy and influential Americans, in particular the Vanderbilts and the Blumenthals. In 1914 he travelled to Italy, visiting Naples, Pompeii and Herculaneum. The bronze furni-

Rateau: bathroom for Jeanne Lanvin, 1902-22

ture in the Naples Museum and the sophisticated delicacy of the wall paintings in the excavated cities had a lasting influence. The range of stylistic and iconographic reference in his work extended from the ancient Mediterranean civilizations to Flamboyant Gothic and the 18th century of Watteau and Fragonard, and from Moorish Spain to Persia, Mughal India and Indonesia.

Having served during World War I from 1915-19, Rateau resigned from Alavoine to found his own company. In November 1919 he sailed for New York and encountered the Blumenthals, who became his first clients. He created his first pieces of bronze furniture inspired by antiquity for the patio area of the indoor swimming pool of their Manhattan house and decorated the walls of their ballroom with painted panelling in full-blown Rococo style, demonstrating his versatility. He was to continue to work on their French residences throughout his career. That early group of furniture included a pair of X-frame chairs in patinated bronze with open-work backs and seats composed of interlocking grids of flat fish and

top rails and slung arms formed of skeins of cockle shells. Each chair frame was cast with a surface pattern of fine netting and the arms terminated in snail scrolls. The removable seat cushions were covered in ocelot fur, an early instance of the Art Deco use of exotic animal pelts in furnishing. The description gives some idea of the minute detail and opulence of their construction, which, despite being executed in such a dense material, appears light, elegant and timeless. Identical copies of these chairs, and indeed of most of his bronze furniture designs, were to be made for many of Rateau's future clients; an exclusive limited edition issued for a privileged elite.

Rateau's most important patron was the couturier, Jeanne Lanvin. He decorated the pavilion she had Bouwens de Boijen build, adjacent to her town house at 16 rue Barbet-de-Jouy near Les Invalides in Paris (1920-22). As the artistic director of Lanvin Decoration, he went on to decorate her properties outside Paris and at Deauville and created interiors for her shops, Lanvin Sport and Lanvin Homme. He rented large workshops, which he bought in 1922, at Neuilly-Levallois in

order to build and decorate furniture and plasterwork and to weave fabrics. The interior of the apartment is probably his best-known project since Lanvin's private suite of rooms on the first floor – boudoir, bedroom and bathroom – were dismantled in 1965 and have been recreated at the Musée des Arts Décoratifs with their complete furnishings intact.

Mme. Lanvin's octagonal boudoir, panelled in pale grey, is lined with gilt-framed showcases intended to house her collections of fans, shoe buckles and scent bottles. The gilt capitals of the yellow Siennese marble half-columns flanking each showcase and the stucco panels above them have delicately stylized gilt reliefs of parakeets, pheasants and squirrels. An extensive repertory of fauna and floral motifs is a hallmark of Rateau's style. The recurring theme of the bedroom is the daisy or marguerite – the name of Lanvin's daughter. The walls and all the hangings are of hyacinth-blue shantung silk (*bleu Lanvin*) embroidered with daisies behind a low, white-painted, scalloped trellis with bunches of daisies in relief.

The furniture ranges from low, wooden chairs and footstools with deep-buttoned upholstery, recalling the 1840s, to Rateau's unique bronze pieces. These include slender, standard lamps and a low table, each with bird supports, circular, glass-topped tables and an extraordinary dressing table whose black marble top rests on tassel-capitalled, tapering, fluted legs and whose circular mirror has bird supports and is fitted with light bulbs at the centre of three daisies. The bathroom has walls and fittings of yellow marble, a geometric-patterned floor in black, white and yellow, and all the fittings and accessories are of patinated bronze in the form of plants, birds and butterflies. The stucco relief behind the oval bath shows a stag and doe in an idealized landscape. Rateau created an oval bathroom of similar opulence with complex, painted wall decorations inspired by Persian miniatures for the Duchess of Alba's Liria Palace in Madrid in 1921.

Another important commission for Lanvin Decoration was the interior for the Théâtre Daunou in Paris (1921–22), designed by the architect Auguste Bluysen, which has recently been restored. The elegant, shield-backed seats are upholstered, like the walls and drapes, in *bleu Lanvin*, and the proscenium arch is bordered with pierced, gilt panels teeming with birds and animals among fruiting vine and flowering forests. The last major collaboration with Lanvin was the Pavillon de L'Élégance at the Paris 1925 Exhibition, built by the architect, Fourniez. Rateau designed sculptures of modish, modern women which were placed against exterior walls whose stucco surface was patterned like the plasterwork of the Alhambra. Inside, Rateau supplied furniture for the individual displays of couture clothes shown by Lanvin, Jenny, Worth and Callot Soeurs. Rateau also worked with Fourniez to decorate a number of spaces within the Grand Palais including the tearoom, a covered garden, a dance hall and a ballroom. Denied the opportunities afforded to members of the Salon to exhibit work, Rateau arranged with the Seligman Gallery to recreate the bathroom of the Duchess of Alba, to great acclaim.

Decorated panels – the flat surfaces of furniture such as bed heads, free-standing, hinged screens or sections of wall decoration – are characteristic of Rateau's style. He specialized in designs executed with the utmost subtlety in combinations of oil and water gilding. Rateau installed such panels in the bathroom of the Blumenthals' Château de Malbosc near Grasse

(1925–26) and set them, alternating with mirror-glass pilasters, into the walls of the music room he designed for Cole Porter in 1927. He had already demonstrated in the Blumenthals' New York ballroom his ability to produce charming pastiches of the Rococo style and he continued to produce such designs for more conservative clients, like the Marquis d'Andigné (1921) or the Comtesse de Beaurepaire (1924). He was equally interested in interiors of the late Gothic and Renaissance, in particular carved, linen-fold wood panelling, which he reinterpreted in a contemporary mode in the Blumenthals' bathroom at Malbosc, and on pieces of furniture such as panelled cupboards and stools, to which he gave skirts. In 1927 he was commissioned by Mrs. Wilson-Filmer, later Lady Baillie, to restore the late-medieval wood carving at Leeds Castle in Kent, which involved work on the external structure as well as the interior stairwell of the Gloriette.

In the latter part of his career Rateau became involved in designing several buildings in a grandiose, Neo-Classical style. By this time he was designing interior spaces on a similar scale, producing and furnishing a salon for the Pavilion of the Comité français des Expositions for the Paris Exhibition of 1937. This was the last in a series of official commissions which included designing furniture for the administrative offices of the Mobilier national in 1926, furnishing the French legation in Belgrade and the French Embassy in London (both in 1934), the Foreign Office in 1935 and the Ministry of Commerce in 1936. He died in 1938 before he could carry out work for the French legation to Ottawa.

Biography

Born in Paris, 24 February 1882. Studied drawing and wood-carving at the Ecole Boulle, Paris, 1894–98. Married Thérèse Vidor, 1908: 1 son and 1 daughter. Worked with the designer and ceramicist Georges Hoentschel, 1898–1904; artistic director of Alavoine & Cie., decorators, 1905–19. Served in the French forces during World War I. Visited New York, 1919. Established and ran his own design practice and workshop in Paris from 1920; artistic director of Lanvin Decoration from 1920; received state furnishing commissions from 1926; involved in architecture and garden design from 1927. Participated in the Paris exhibitions, 1925 and 1937. Chevalier, Légion d'Honneur, 1926. Died in Paris, 20 February 1938.

Selected Works

Reconstructed interiors from Jeanne Lanvin's apartment, and a large collection of drawings, designs and documentation relating to Rateau's work, are in the Musée des Arts Décoratifs, Paris; additional archival material is in the Bibliothèque Forney, Paris. Much of Rateau's furniture is in private hands, but examples are in the Art Gallery and Museum, Brighton, the Metropolitan Museum of Art, New York, and the Museum of Fine Arts, San Francisco.

Interiors

- 1920 Blumenthal Apartment, New York (furniture and decoration): George and Florence Blumenthal
- 1920–22 Apartment, 16 rue Barbet-de-Jouy, Paris (interiors and furnishings): Jeanne Lanvin
- 1921–22 Liria Palace, Madrid (bathroom): Duchess of Alba
- 1921–22 Théâtre Daunou, rue Daunou, Paris (interior and furnishings)
- 1924 House, Comtesse de Beaurepaire, Blvd. St. Germain, Paris (interiors and furnishings): Comtesse de Beaurepaire

- 1925 Exposition des Arts Décoratifs et Industriels, Paris (interiors and furniture: Pavillon de l'Élégance, Grand Palais)
- 1925–26 Château de Malbosc, Grasse (bathroom): George and Florence Blumenthal
- 1926 Mobilier National, Paris (office interiors and furnishings)
- 1927 Apartment, rue Monsieur, Paris (music room): Cole Porter
- 1927–29 Leeds Castle, Kent, England (restoration and interiors): Mrs. Wilson-Filmer
- 1930–32 17 quai de Conti, Paris (renovations and interiors): Armand-Albert Rateau
- 1934–36 French Government Offices in Belgrade, London, and Paris (furniture)
- 1937 Exposition Internationale des Arts et Techniques Appliqués à la Vie Moderne, Paris (salon, Comité français des Expositions)

Rebecca, Biagio 1735–1808

Italian painter and decorative artist

Biagio Rebecca was one of the most prolific and successful decorative artists of the Adam period who specialised in painted panels, grotesques and imitation bas-reliefs. Born in Osimo, Italy in 1735, Rebecca made the acquaintance of several English artists, including the history painter Gavin Hamilton and the portraitist George James, while he was studying at the Accademia di San Luca in Rome. With their encouragement, he travelled to England in 1761 where he remained until his death in 1808.

Rebecca was one of many foreign, principally Italian artists working in England in the second half of the 18th century. The absence of a strong native tradition of decorative painting meant that foreign artists had frequently been employed previously, but this period was particularly rich in opportunities and foreign painters virtually monopolised the market for decorative painting in England. The taste for Neo-Classical style interiors and decoration flourished, and the vogue for grotesques,

trompe-l'oeil and grisaille decoration, for which Rebecca was particularly famed, ensured that he and other foreign artists – notably Antonio Zucchi and Giambattista Cipriani – were constantly employed by the major architects of the period. Rebecca's talents were used predominantly by Robert Adam, William Chambers, James and Samuel Wyatt and Henry Holland.

In 1770 and 1771, Rebecca worked on several of the decorations devised by William Chambers for Woburn Abbey, Bedfordshire, and a letter from Chambers written to his patron, the 4th Earl of Bedford, in 1770 about the work in progress includes the remarks: "I believe one of the painters that is about the library Ceiling will go downe next week to make his remarks upon the light and verify some measures and as he cannot speak a word of English I should be obliged to you if you would desire anyone in the family that understand Italian to ask for anything he may Want of the workmen" (Beard, 1966). Although it is possible that Chambers was referring to Cipriani, who had been resident in England for fifteen years and was a prominent member of the art establishment, both Rebecca and Cipriani are known to have worked on the decoration of this room. The decorative paintings at Woburn executed during the 1770s were replaced during the 1780s by Henry Holland. Fortunately, however, a drawing by Chambers of the library ceiling illustrates the border decoration executed by Rebecca containing griffins and acanthus scrolling interspersed with small classical figures.

Heveningham Hall, Suffolk, completed and decorated by James Wyatt, contains extensive decorative painting by Rebecca. In the Saloon the ceiling and walls are decorated in *trompe-l'oeil* arabesque panelling, classical groups and a band of running boys, painted with green tones on a biscuit ground; a scheme which "could have been disturbing if painted in polychrome, but so sensitive is the tonality that the room is a soft golden unity, the painting serving as texture" (Hussey, 1956). In the Etruscan room, a style of decoration that was extremely fashionable during the last decades of the 18th century, Rebecca's red classical figures appear against pale green walls and white wood and plaster detailing. In the Library, Rebecca's cameo medallions of poets (repeated in the decorative scheme in the Library at Heaton Hall) and the ceiling medallion representing Apollo were executed in white relief on a reddish brown ground; the latter echoing the porphyry of the chimney-piece and columns. Finally, Hussey also mentions the existence of a decorative scheme (probably by Rebecca) for the Dining Room which was not executed, in what he describes as "bright Kauffmannesque polychrome" (Hussey, 1956).

The great Saloon at Kedleston Hall which was inspired by the Pantheon in Rome contains four large overdoor classical capricci by William Hamilton and between these large grisaille paintings by Rebecca. Untypically, these represent four scenes from English history: *The Dukes of Northumberland and Suffolk Entreating Lady Jane Grey to accept the Crown*; *Edward the Black Prince serving the French King (then his prisoner) at Supper*; *Lady Elizabeth Grey Imploring of Edward IV and The Tender Eleanora Sucking the Venom out of the Wound which Edward I, her Royal Consort, Received with a Poisoned Dagger*. The latter two paintings are after designs by Angelica Kauffman (Roworth, 1992). The grisaille technique often associated with Rebecca involved, as its name suggests,

painting in monochrome grey or greyish colour and was used to imitate bas-relief and sculpture. It was a technique used by many heavyweights of the Italian Renaissance such as Giotto (Arena Chapel, Padua), Uccello (the Duomo in Florence) and Mantegna. In Kedleston, the grisaille technique can also be seen in the panels around the Marble Hall.

Rebecca's most famous decorative work, at Audley End, Essex, is not typical of his style, but it reveals a versatility in his oeuvre and suggests skills beyond those for which he is principally remembered. The scheme in the Saloon contains life-sized ancestral portraits some of which were executed in the style of Holbein and Gheeraerts using as a source the engraving by George Vertue after *The Visit of Queen Elizabeth to Blackfriars* attributed to Marcus Gheeraerts the Younger (Walker, 1957). Elsewhere, the Adam interiors at Audley End include an Etruscan Room with paintings by Rebecca. The frieze represents the Triumphs and Sacrifices from Montfaucon's *Antiquities* and the female figures are taken from archaeological finds at Herculaneum. According to William Addison "Rebecca's cunningly deceptive craftsmanship is well exemplified here" (William Addison, *Audley End*, 1953). It was apparently at Audley End that the most well-known example of Rebecca's fabled tomfoolery occurred: "This clever decorative artist was an inveterate private joker ... he alarmed Lady Howard by painting a black kettle on a piece of card, which he placed on a white satin chair" (Addison, 1953).

Painted decoration by or attributed to Rebecca can also be found in Heaton Hall, Lancashire (of particular interest are those decorating the Cupola and the grisaille painting on the Music Room Organ), the Great Drawing Room and Dining Room at Crichel Dorset (attributed to Rebecca because of their likeness to his work at Heveningham), Montagu House, London (destroyed), Doddington Hall, Cheshire (those in the circular Saloon are attributed to Rebecca and both room and paintings relate to Heaton Hall), Berrington Hall, Herefordshire (grisaille medallions of English writers in the Library and the ceiling paintings in both the Dining Room and Drawing Room attributed to Rebecca), Harewood House, Yorkshire (Library and Gallery), Goodwood House (Library), and Shardeloes, Buckinghamshire. At Attingham Park, Shropshire, the Boudoir paintings are traditionally attributed to Angelica Kauffman but are probably by Rebecca or Cipriani (Attingham was built between 1783 and 1785 after Kauffman, then married to Antonio Zucchi, left England). In addition to painted schemes, Rebecca also designed cartoons for stained glass, an example being the chapel at New College Oxford 1772.

JACQUELINE RIDING

Biography

Born in Osimo, 1735. Studied at the Accademia di San Luca, Rome, where he met the historical painter Benjamin West, and the portraitist George James. Married: son was the architect John Baptist Rebecca. Settled in England, 1761. Worked with George James; attended the Royal Academy, London, 1769. Active as a leading painter of decorative panels, grotesques and bas-reliefs from c.1770; designed stained glass during the 1780s. Exhibited at the Royal Academy from 1770; elected Associate, 1771. Died in London, 22 February 1808.

Selected Works

Examples of Rebecca's work can still be seen *in situ* at various locations including Audley End, Essex, Heveningham Hall, Suffolk, and Kedleston, Derbyshire.

Decorations

- c.1765–70 Kedleston, Derbyshire (breakfast room, marble hall, saloon, and staircase; architect R. Adam)
- 1770–71 Woburn Abbey, Bedfordshire (breakfast room and library; architect W. Chambers)
- c.1771 Harewood House, Yorkshire (music room and gallery; architect R. Adam)
- c.1772 Heaton Hall, Lancashire (billiard room, cupola room, and dining room; architect J. Wyatt)
- 1774–75 Audley End, Essex (saloon, Etruscan room, and breakfast room; architect R. Adam)
- c.1776 Montagu (later Portman) House, London (saloon and dressing room; architect J. Stuart)
- pre-1781 Berrington Hall, Herefordshire (library, dining room, staircase, drawing room and boudoir; architect H. Holland)
- 1797–99 Heveningham Hall, Suffolk (saloon, Etruscan room, dining room and unexecuted scheme for the library; architect J. Wyatt)

Régence Style

To speak of the Régence is to refer to the transition in France during the early 18th century between the Louis XIV and Louis XV styles. The period is viewed by many art historians as in fact the first phase of the Rococo: it fully participated in the development of the latter, and found its ultimate expression there. While it corresponds in name to the regency from 1715 to 1723 of Philippe, the Duc d'Orléans, it actually embraced the declining years of the Sun King's reign and the earliest part of Louis XV's monarchy. The period is characterized by a movement away from the majestic, stately Classical Baroque and towards the lighter, more intimate expression of the Rococo.

The turn of the 17th and 18th centuries witnessed a coinciding of several events which favoured the shifting of political power and artistic patronage to Paris from Versailles. Louis XIV's glorious kingdom had been losing its lustre since its apogee in the late 1680s, the War of Spanish Succession taking a serious toll on the finances and morale of the country. The

Régence Style: Salon de Compagnie (Chinese salon with paintings by Christophe Huet), Château de Champs-sur-Marne, c.1748

intellectual and social spheres were also suffering under wrenching attacks on established orders, and the Church was under fire for internal abuses and general corruption. The Court itself held fairly steady, however, and was even infused with new life by the presence of the younger generation led by the Dauphin and the charming and effusive Duchesse de Bourgogne. This renaissance was short-lived, however, and the premature deaths in 1711 and 1712 of the Dauphin, the Duc and Duchesse de Bourgogne, and the Duc de Berry left a critical gap in court life.

From this point forward the social, intellectual, and artistic focus moved away from Versailles to Paris, where it remained for the rest of the century. Versailles was gloomy and faded, and it bowed under the weight of timeworn and ineffectual ceremony; in contrast, new circles of bright intellectual and artistic activity were forming in Paris around the Regent, the Duc d'Orléans and the Duchesse du Maine. In addition, the bankrupt state coffers had necessitated a halt to virtually all new building projects by the Crown, thereby forcing architects and artists to seek employment in the private realm. The numerous wars during the latter part of the 17th century had also served to upset the social order, creating a small group of profiteers whose ambitions and newly-acquired wealth

gravitated towards "modern" artistic expression. Many of the architects and decorators working for the Crown at the turn of the century found themselves creating new *hôtels* in new neighborhoods such as the Faubourg St.-Honoré and the Faubourg St. Germain in Paris during the regency.

On the political front, the Duc d'Orléans moved the seat of government to Paris the day he ascended to his position as Regent in 1715, and chose to continue living in the Orléans home at the Palais-Royal. The young king, then five years old, was installed in the Tuileries. The Regent was both a connoisseur and a collector, but not an adept state leader, so his legacy was more artistic than political. In fact, his apparent lack of understanding regarding the power of his position led to administrative chaos, with a resulting diffusion of power. Add to this the financial crash incited by the wild, speculative schemes of John Law (from which few old-moneyed Frenchmen survived unscathed and a good number of *nouveaux riches* emerged) and the general picture of transition is complete.

Stylistically the Régence can be divided into two parts, the first corresponding to the period of 1700 to 1715, when the art of the Court began to shed the heavy mantle of "official" style in favor of greater simplicity and elegance. It was in 1699 that

the Sun King himself, in an oft-quoted passage, called for a lightening of design, an infusion of "youthfulness" missing from drafts for renovations of the Château de la Ménagerie at Versailles, intended for the young Duchesse de Bourgogne. Louis XIV's taste had always been impeccable, and he sensed a need for change in the official Court style. As has been pointed out, even the King required spaces to which to retreat from the elaborate and richly ceremonial *Appartements* at Versailles, which he found at Marly and at Trianon.

The results of this yearning can be seen in the elegant interiors at Marly, Meudon, Versailles and Trianon. Here, key figures in the movement towards Rococo, chiefly Jules Hardouin-Mansart (1646–1708) and his associates at the Bâtiments, emphasized comfort, convenience, and above all gracefulness of design. The full-blown Louis XIV style, as exemplified by the work of Charles Le Brun (1619–90), was waning, with less emphasis placed on heavy sculptural elements, bold Classical Orders, and other Baroque features. Also, the demarcation between the architecture and decoration of interiors was blurred by the conquest of ornament. This impulse came through the genius of designers such as Jean I Berain (1640–1711), Claude III Audran (1658–1734), and Pierre Le Pautre (c.1648–1716). The delicate, fanciful grotesques and arabesques of Berain and Audran served as the basis for unique decorative schemes in which elements that were previously painted onto the flat surfaces of walls, became three-dimensional and broke through the confines of articulated wall panels. The ribbonwork and C-scrolls which served as the foundation of the arabesques and grotesques were created in relief and became the framing elements themselves. A new sense of motion resulted, with the eye skirting across the traditional horizontal and vertical divisions, which now had fewer and fewer formal visual props. This scurrying movement would eventually culminate in an almost dizzying effect created in full Rococo interiors by large overmantel and pier glasses reflecting the light from candles positioned around the rooms.

Another important innovation was the heightening of the wall panels and windows, which not only created a different sense of space, but also served to more closely tie the interior with the exterior, life with nature. This fitted perfectly with the increased interest in and idealization of the outdoor and rural life by the wealthy, as manifested in such fantasies as Jean-Antoine Watteau's (1684–1721) *fêtes galantes* and Marie-Antoinette's Hameau of later in the century. While this revised articulation of interior walls resulted in the appearance of greater space, rooms in fact were becoming smaller. An enormous concern with both privacy and intimacy arose during this period, and architects answered with floor plans that stressed habitability rather than grandeur or ceremony.

Probably the most influential interior designer during this first phase of the Régence was Pierre Le Pautre, whose chimneypieces at Marly, dating to 1699, have been cited as containing the first germ of true Rococo interior design. His genius was certainly recognized by Mansart, who entrusted him with the most important projects at the Bâtiments, as well as by Robert de Cotte (1656–1735), Mansart's successor as Surintendant. Le Pautre is credited with first converting Berain and Audran's decoration into three-dimensional wall articulation, but he was not alone in this endeavour. The idea was

adopted by many of Mansart's pupils, with one notable exception: Germain Boffrand (1667–1754). Indeed, Boffrand adopted some features of early classicism in his repertoire, but nevertheless employed them in a manner consistent with the general tendencies of the period. Two of his masterpieces, Malgrange and the Petit Luxembourg, demonstrate, however, a system of decoration more sophisticated than their contemporaries: the ornament was entirely independent of the architecture. With his "a-tectonic system ... which freed the wall from any functional articulation and subjected it entirely to the sway of ornament, Boffrand had laid one of the most important foundations for the Rococo style" (Kalnein, 1995).

The line between the first and second phases of the Régence period is drawn most heavily by the coming of age of a new generation of architects and designers, rather than by the ascension of the Regent. This artistic personnel was responsible for furthering the patterns set forth during the previous decade and a half, and for developing the transitional link with the Rococo. Yet there was not as clear a distinction between architecture of the last years of Louis XIV and those of the Regent, as there was in decoration. The young king showed no interest in architecture, so the driving forces remained the wealthy aristocracy and bourgeoisie. And Paris remained the artistic center of the country despite Louis XV returning the court to Versailles in 1723.

Of primary interest to theorists as well as architects during this second period was the development of a greater unity of design, that is, design that not only embraced the interior and the exterior, but also married the concepts of elegance, convenience, and functionality. The idea of *convenance*, or "the right relation of the parts to one another and to their purpose," dominated thinking, and "governed the size and character of a building, its plan, and even its decoration, which was supposed to run right through from the hall to the salon, growing slowly but steadily richer all the time, without any surprise effects" (Kalnein, 1995). Closely aligned with this was the importance placed on the association of function with design, vis-à-vis the ingrained national sense of propriety and correctness. All this constituted a rather rigid framework within which architects were expected to operate, but one which they did not rebel against and one which was in surprising contrast to the increasing freedom accorded decoration.

The two most important designers of the second phase of the Régence, or the Régence proper, were Giles-Marie Oppenord (1672–1742), who worked for the Regent, and François-Antoine Vassé (1681–1736), who was employed by the Bâtiments. With these two came a return to three-dimensionality and figural motifs within interiors, and a movement away from abstract ornament such as that of Le Pautre. Oppenord utilized exuberant, fully-sculptural decoration and Italian Baroque motifs in exciting and fantastic schemes which owed much to his Roman training. In his Hôtel de Pomponne interiors, dating to 1714, Oppenord blends the basic decorative ensembles of Audran with images from Watteau; but just a few years later he demonstrates even greater inventiveness when his Roman training is allowed full passage into standard French formats. He also cast off artistic conventions by reworking certain motifs such as the stylized, symmetrical shell, making it fully organic, and adopting a-tectonic, weightless frames with ruffled edges. Such devices can be seen in his

work for the Regent at the Palais-Royal and in numerous other important commissions earned through his official position.

Vassé worked concurrently under de Cotte at the Bâtiments, and because of his stronger adherence to French traditions proved to be more influential to the development of the style than Oppenord. His work is nevertheless comparable to that of Oppenord in its bold, vigorous ornament, sculptural reliefs, and predominant cartouches and shells. One of the masterpieces of Régence design, the Galerie Dorée in the Hôtel de Toulouse in Paris (still extant and now housing the Banque de France), was redecorated by Vassé under de Cotte and exhibits all these characteristics. Yet de Cotte was fundamentally a traditionalist, so most of the works produced under his supervision are serene and classical compared with the designs of Oppenord.

There were, of course, many talented and creative architects and designers working during the Régence in addition to Vassé and Oppenord. Jean Aubert (d.1741), Jean-Bernard-Honoré Toro (1672–1731), Jacques V Gabriel (1667–1742), and Claude Gillot (1673–1732) were notable architects and designers whose finest work stands among the best products of the era. The features which distinguish their work are fairly consistent with general trends of this *goût moderne* and can be recognized by the use of arabesques as the foundation of decorative schemes; heavy employment of ribbonwork, trophies, large-scale mirrors, depressed arches, and friezes with consoles; use of modified Classical orders and smaller mantel-pieces; and adherence to symmetry and the revised articulation of walls, with the resulting fusion of ornament with architecture. There was always an overriding nobility in Régence design, and a graceful elegance. Colors and materials were simpler, white and gold *boiseries* becoming much more common not only for their aesthetic appeal but also for their relative economy.

Finally, one of the hallmarks of 18th-century interior design in France was the careful coordination of architecture not only with decoration, but also with furnishings. Here many of the prevailing decorative schemes such as arabesques, grotesques, *singeries*, and Chinoiseries sought expression on smaller objects. Likewise, themes of the Régence style – nature, fantasy, exoticism, and asymmetry (although the latter was not to gain real acceptance until the later phases of the Rococo) – could also be found incorporated into designs for utilitarian objects. Charles Cressent (1685–1768), a cabinet-maker and bronze-worker, has become closely associated with the Régence style, his furniture and mounts so entirely embodying the aesthetic principles of this period. His name is also associated with the popularization of richly-figured woods such as palissandre and amaranth and for the creation of finely-chased and gilded mounts, particularly *espagnolettes*. In the work of Cressent, as in that of the silversmith Nicolas Besnier (fl.1714–54), the ornamental sculptors Jules Degoullons (c.1671–1738) and François Roumier (d.1748), and the porcelain of St.-Cloud, one finds the fullest statement of prevailing aesthetic principles. Their furnishings echoed the new treatment of interior architecture and helped create a unity of design which heralded the full Rococo style.

Regency Style

In strictly political terms, the Regency lasted only nine years, from 6 February 1811, when the Prince of Wales took the oaths of office as Regent, to 29 January 1820, when the old King, George III, finally died and the Regent became King George IV. However, in artistic terms the "Regency period" is generally taken to encompass the second half of the reign of George III (1760–1820) and the reigns of his sons George IV (1820–30) and William IV (1830–37). And while it is best to avoid a rigid chronological definition of any particular style or fashion, one year does serve as a useful starting-date for the Regency era: 1783, the year in which the Prince of Wales came into his majority, and in which the architect Henry Holland (1745–1806) began work on the remodelling of the interiors at the Prince of Wales' Carlton House, thereby inaugurating a period of more formal, Neo-Classically-influenced design.

Neo-Classical precepts were fundamental to the Regency interior. The ancient world, and in particular classical Greece, had been rediscovered during the 1750s and 1760s – news of which was spread to an enthusiastic English-speaking audience by published works such as Stuart and Revett's magisterial *The Antiquities of Athens* of 1762. Established designers such as Robert Adam, Josiah Wedgwood and Thomas Chippendale had adapted Antique Roman and Greek motifs for use on every conceivable object or surface. Before Adam's death in 1792, however, Henry Holland and his followers had initiated an austere and academic reaction against Adam's frivolous, light and rather superficial interpretation of ancient forms. Holland's designs were still elegant and restrained, but they expressed more openly their debt to the archaeological investigation of Greece, Rome and Egypt, as well as to the heavier Directoire and Empire styles of revolutionary and Napoleonic France. The interiors at the Prince's own Carlton House underlined this new direction. In 1785, two years after Holland's

Regency Style: Blue Velvet Room, Carlton House, London, 1819

French craftsmen had started work there, Horace Walpole perceptively noted “How sick one shall be after this chaste place, of Mr Adam’s gingerbread and snippets of embroidery”.

Holland’s taste was popularised in the pattern books of Charles Heathcote Tatham (1772–1842), whom Holland had sent abroad to copy Greek and Roman designs first-hand, and by Thomas Hope (1769–1831), whose radical new designs for architecture and furniture were central to the development of the Regency style. Hope’s *Household Furniture and Interior Decoration* of 1807 reached a comparatively limited audience, but many of his designs were incorporated into the pattern books of cabinet-maker George Smith (most notably his *Collection of Designs for Household Furniture and Interior Decoration* of 1808) and the hugely popular periodical, the *Repository of Arts*, published between 1809 and 1828 by Rudolph Ackermann (1764–1834). Hope travelled extensively in the Mediterranean, but, although he made great use of the discoveries at Pompeii and Herculaneum, his interiors are couched in a more chastely Graeco–Egyptian manner than the

more ostentatious Roman-influenced interiors of contemporary French designers.

Regency style, however, derived from more than just the application of forms and motifs from the ancient world. More than at any other time in Britain’s history, interior design was affected not only by taste but also by technology, politics and personalities. The most important individual influence was the Prince Regent himself. George’s patronage of the arts – which contrasted so dramatically with the homespun, domesticated idylls of his parents – was vital to the propagation of the Regency Style. Holland’s pioneering work at Carlton House has already been noted. And in 1806 Holland’s calm interiors were themselves remodelled in a riot of crimson and gold by a Prince ever anxious to promote, not lag behind, innovation in interior design, and who proved himself the most active royal patron of the arts since Charles I.

George IV’s keen interest in architecture and decoration served as a catalyst for the enthusiasm of his subjects. In 1811 Ackermann introduced the Regent’s badge (the Prince of

Regency Style: Greek furniture from Rudolph Ackermann's *The Repository of Arts*, 1809

Wales's plume of feathers) into the furniture designs of the *Repository*, and by 1812 it was reported that the plume was now a "prevailing ornament" in domestic interiors. The Prince also popularised the return to Chinoiserie and the taste for the "Indian" or "Hindu" style. Both Indian and Chinese manners were employed at the Regent's new Pavilion at Brighton, where Holland's simple seaside villa was, after 1815, transformed into an oriental fantasy by the architect John Nash (1752–1835) and his gifted interior designers Robert Jones and Frederick Crace.

For much of the Regency – from 1793 to 1802 and from 1803 to 1815 – Britain was at war with France. Southey reflected the general ambivalence towards France when he wrote of the English in 1807 that "they hate the French and ape all their fashions, ... laugh at their inventions and then adopt them". The conclusion of peace in 1815, though, inevitably brought French taste flooding back – especially to the Regent's own interiors. In 1822 the *Repository* noted that "The Taste for French furniture is carried to such an extent, that most elegantly furnished mansions ... are fitted up in French style".

Even more important than the taste of the Prince Regent was the crucial role industrial development played in changing the way rooms were decorated and disposed. The pace of technological advance had quickened after 1780. In 1785 steam was harnessed to a cotton mill for the first time, and by 1788 there were 40 cotton mills in South Lancashire alone. By 1790 the cities of Liverpool, Hull, Birmingham, Bristol and London were all linked by canals, and in 1801 Richard Trevithick's steam carriage first appeared on the roads of Britain. The effect of industrialisation on traditional decorative and architectural crafts was profound. Householders were now able to buy fabrics previously only affordable by the rich. Machine-printed textiles, advised Thomas Sheraton in 1794, could now be "adapted for the purpose of ornamenting panels and the walls of the most elegant and noble houses". And rapid advances in natural dye technology (synthetic dyes did not appear until the 1850s) soon made the official ban on imported chintzes irrele-

vant. Nor was technological progress limited to fabrics. Cylinder presses replaced much of the hand-blocking of wall-papers, the appearance in 1839 of Harold Potter's power-driven rollers, able to print four colours and to remove surplus ink, inaugurating the age of mass-produced wallpaper. Similar innovations were introduced in almost every area of interior decoration. Lucas Chance's plate glass of 1832 allowed window manufacturers more freedom to dispense with internal glazing bars; Samuel Bentham's woodworking machinery took much of the drudgery out of the production of joinery mouldings; John Vickers's "Britannia metal" (an alloy of tin, copper, bismuth and antimony) provided house owners with a cheap and lustrous alternative to silver. The onset of war with France in 1793 provided a further boost to advances in the metalwork trades: brass door furniture suddenly became widely available, while the forms of cast-iron door furniture grew more delicate and diverse.

Many of these industrial innovations were designed expressly to make life more comfortable for the average householder. A good number helped to make interiors warmer – notably Count Rumford's patent stove of 1796; steam-heating, introduced by the Earl of Shelburne at Bowood during the 1790s and by Sir Walter Scott at Abbotsford in 1823; and hot water piping, installed by the Duke of Wellington at Stratfield Saye in 1833. The Argand colza-oil lamp, patented by the Swiss Ami Argand in 1783, brightened the drawing room enormously, while the new gaslights, becoming relatively common by 1830 (although Lord Dundonald introduced gas lighting into his home in 1787, and the first public gas lighting was installed in Pall Mall in 1807), revolutionised the way interiors could be both used and decorated. Even bathrooms and lavatories were beginning to be taken seriously: by 1797 Joseph Bramah had sold 6,000 of his revolutionary ball-cock WC cisterns (patented in 1778), and Nelson's new home at Merton contained no less than one en-suite bathroom for each of its five bedrooms.

Panelling and plasterwork of the period were more rectilinear and restrained than in previous decades, most Regency wall

Regency Style: parlour remodelled by Humphry Repton, from *Fragments on the Theory and Practice of Landscape Gardening*, 1816

and ceiling decoration obeying Ackermann's dictum that a "simple and chaste character is best". Mouldings were mostly of low relief, with Greek motifs such as the anthemion (the honeysuckle flower) and the wave-like Vitruvian scroll being profusely used, while simple "reeding" – a fusion of semicircular bead mouldings – was the most commonly-chosen decorative solution for chimneypieces and for door and window surrounds.

In 1807 Thomas Hope's *Household Furniture* ... introduced the term "interior decoration" into the English language. And, thanks to the flood of pattern books that were newly available, for the first time the design and decoration of rooms became a popular occupation not just for the grandee but also for the middle-class householder. The concept of en suite decoration was introduced by Ackermann in his *Repository* after 1809, and by 1833 J.C. Loudon (1783–1843) was firmly asserting in his *Encyclopaedia of Cottage, Farm and Villa Architecture and Furniture* (a complete guide to the architecture and decoration of the average home) that carpet colours should harmonise with the walls and furniture, paintwork should match the ground of the wallpaper, and that the colours and materials of the seat upholstery should always marry with those of the curtains. Most often indeed it was the colour of the furniture fabrics that dictated the overall scheme for the room.

The new popularity of en suite decoration did not, however,

mean that the whole house was coloured uniformly. The function of each Regency room directly corresponded to its decorative prerequisites. D.R. Hay's *Laws of Harmonious Colouring* of 1828, for example, specified different colours to match the different moods of each room. Thus, while the dining room, being "warm, rich and substantial", was best suited to deep reds, the "solemn and grave" nature of the library made it more suitable for greens, while the "light, clearing and cheerful nature" of the bedrooms suggested blues and off-whites.

Red was particularly prevalent in the Regency interior, being widely believed (among others, by the eminent artists J.M.W. Turner and Sir Thomas Lawrence) to be the most appropriate background for the gilt frames of paintings and prints. Greens were much used for halls, drawing rooms and bedrooms, as well as for libraries, but tended to be more common outside, rather than inside, the home, being much favoured for ironwork and external woodwork. Strong yellows were, thanks to advances in dye technology, increasingly available. "Drab" colours – greeny-yellows, yellow-browns and yellow-golds – were, for example, widely used for paintwork and wallpapers in the years after 1799, when Dr. Edward Bancroft introduced the new, cheap dye "quercitron yellow" he had obtained from the bark of the North American oak. Gilt, however, was (at least outside the residences of the very rich) increasingly unpopular. In 1818 the architect and prolific pattern book author J.B. Papworth (1775–1847) boasted that his model homes contained "no portion of gilding", while in 1833 Loudon advised that "gilding, unless in very small quantities for the sake of relief, should be avoided".

By 1830 combinations of secondary tones – light blues, lilacs, buffs, greys and pinks – and stronger hues of their complementaries had become common, Ackermann particularly recommending the use of lilac or fawn with bright green. Most sophisticated room schemes, though, used white only on the ceiling. In 1828 Hay noted that white was "seldom employed in house-painting", having "entirely given way to shades of various colours and imitations of the finer kinds of wood". Graining was indeed very widespread, Nathaniel Whittock remarking in 1827 on "The very great improvement that has been made within the last ten years in the art of imitating the grain and colour of various fancy woods and marbles".

If decorative paint effects were considered too expensive, then a wide variety of grained and marbled wallpapers could be bought. Loudon recommended papers "simply marked with lines in imitation of hewn stone" for the hallway, but there were also papers which suggested panelling, watered silk, damask or other, more elaborate drapery designs. More common in bedrooms were floral designs or patterns using small repeats or pin-grounds. As with every aspect of the Regency interior, the simpler the function of the room, the cheaper and plainer the decorative treatment, whether executed in wood, plaster, paint or wallpaper.

By 1837 British machine-made knotted and pile carpets were able to copy the intricate patterns of imported Persian and Turkish examples. Fitted carpets were common, although Loudon favoured retaining a small border of between one-and-a-half and two feet between the carpet and the skirting. Industrial advances also enabled the harder-wearing, reversible "ingrain" floor coverings, used especially for staircases and

hallways, to be made more cheaply and efficiently. In 1822 three-ply ingrain, using more complex and colourful designs that differed from back to front, were first produced in Kilmarnock, one of the primary centres of British carpet manufacture. And for those who could not afford ingrain, painted floorcloths, decorated to mimic marble, Oriental carpets and a host of other designs, were more prevalent than ever.

While technological progress helped to make floor coverings more widely available, Cartwright's power loom of 1787 and Whitney's cotton gin of 1793 enabled the manufacture of cotton fabrics to overtake and eclipse that of more traditional furnishing materials. By 1820 cotton chintzes and calicoes had indeed largely replaced silk for curtains and upholstery. Cotton fabrics were cheaper, lighter and more washable than the silks, satins and moreens that were formerly the rule in middle-class homes. And these cottons could be more brightly coloured, although in 1809 Ackermann noted that "the gaudy colours of the chintz and calico furniture" were giving way "to a more chaste style, in which two colours only are employed to produce that appearance of damask".

In the grander Regency interiors, the most elaborate features – contrasting sharply with the reticence of the mouldings – were the bed or wall curtains. Usually coloured (and lined with a material in a harmonising tone), and extended down to the floor, window curtains represented the decorative focus of a sophisticated Regency room. Those that could be drawn were looped back during the day at dado level, and held with pins or cords. Vertically-drawn festoon curtains were unfashionable by 1800; in 1803 Sheraton noted "the general introduction of the [horizontal] French rod curtain in most genteel homes". Some drawing rooms were fitted with "continuous drapery", where the window drapes ran in massive swags from pelmet to pelmet. And behind the principal curtains was a complex system of muslin sub-curtains and blinds, whose main function was not to retain heat – the wooden window shutters did this – but to filter out the direct light that might otherwise damage fabrics and furniture.

Like internal mouldings, Regency furniture became increasingly restrained and architectural as the period progressed. By 1810 simple geometric forms were much in vogue for furniture as well as for wall mouldings and chimney surrounds, with bold curves, unbroken lines and restricted ornament. And, in contrast to earlier Georgian practice, seat furniture was not placed against the dado or chair rail when not in use, but arranged informally about the room. In her novel *Persuasion* (written 1815–16) Jane Austen noted that "the present daughters of the house were giving the proper air of confusion by ... little tables, placed in every direction", while in 1811 the American Louis Simond was horrified to find that even at Osterley Park "tables, sofas and chairs were studiously deranged about the fire-place and in the middle of the rooms, as if the family had just left them".

By the mid 1820s the spirit of eclecticism had introduced not only Grecian and Egyptian furniture designs into the more fashionable homes, but also Elizabethan, Jacobean, Louis XVI and even Norman revivals. Pointing to the future were the more academically-correct Gothic designs of A.W.N. Pugin (1812–52), illustrated in Ackermann's *Repository* after 1825 and bought by George IV for Windsor Castle in 1827. More characteristic of Regency taste than Pugin's Gothic chairs,

however, were the circular table, with its single, central support; the large, D-ended dining table; cross-framed, scrolled-arm and sabre-leg chairs; the Grecian sofa, with two scrolled ends of equal height equipped with a tasselled bolster; and the sofa-table, which, as a result of the introduction of the Argand lamp could now be used for a variety of purposes throughout the whole day. Regency householders were also enthusiastic purchasers of metamorphic furniture: chairs and tables which, as Ackermann remarked, could "with the greatest of ease, by merely lifting up with the right hand ... be metamorphosed" into a flight of steps or a reading-desk. As with all aspects of the Regency interior, taste and technology always went hand-in-hand.

Principal Collections

The most important surviving Regency interiors and furnishings are in the Royal Pavilion, Brighton. Other notable examples of this style appear in interiors created by architects such as Henry Holland, Thomas Hope, John Nash, Sir John Soane and James Wyatt and can be seen at: Frogmore, Berkshire; Berrington Hall, Herefordshire; Apsley House, Pitzhanger Manor and Sir John Soane's Museum, London; and Attingham Park, Shropshire.

Rehn, Jean (Johan) Eric 1717–1793

Swedish architect, designer and engraver

If any artist can be said to personify the Gustavian style it is Jean Eric Rehn whose all-round skills were deployed in several different areas, including architecture, the applied arts, and above all interior design.

Rehn's principal place of work was the Royal Palace in Stockholm, which had been newly constructed under the direction of Nicodemus Tessin the Younger after the fire at the Old Castle in 1697. Work on the completion of the palace was halted for long periods during the war years and later due to insufficient funds, but was resumed in 1727. After Tessin's death in 1728, the direction of works was taken over by his son Carl Gustaf Tessin, who was assisted by the architect Carl Hårleman. By summoning skilled French sculptors, painters and craftsmen to Stockholm, Tessin and Hårleman ensured that the palace's interiors would be designed in the very latest style. And the Royal Drawing Academy was founded at the Royal Palace in 1735 so as to make sure that future access to trained painters and other craftsmen was assured. This school included the French painter Guillaume Taraval among its teachers, and one of its first pupils was J.E. Rehn.

Rehn also trained as a military engineer, and he graduated as a lieutenant-draughtsman in 1739. From 1740 to 1745 he was awarded a five-year scholarship to study engraving in Paris under Jacques Philippe Le Bas. It was also intended that he should observe the most recent developments in French furniture and other aspects of interior design. And on his return trip home he was instructed to study the silk-weaving factories in Lyon, both for their weaving techniques and for their pattern stocks.

In 1745 he was appointed to the Office of Manufactures with responsibility for the patterns for silk manufacture and for the Rörstrand faience factory. One of the best known faience patterns – an asymmetrical Rococo design incorporating a sprig of hops – which recurs in several faience-wares, is called the Rehn pattern after its author. At the same time he worked as an assistant to Hårleman in the completion of the interior decoration of the Royal Palace. Rehn's collaboration with Hårleman also involved completing and developing his drawings and ideas for manor houses.

Rehn's first important independent commission for the Swedish court was to design the costumes and thrones for the coronation of King Adolf Fredrik and Queen Lovisa Ulrika that took place in 1751. The magnificent thrones, designed in an exuberant Rococo style, were actually meant for the King

and Queen's respective audience rooms at the Royal Palace. In 1753, when the palace was almost ready for occupation, Hårleman died and Rehn took over artistic responsibility for the final work.

In 1754, Rehn embarked upon another foreign trip at the request of the queen and the Office of Manufactures and he travelled in France, Germany, the Netherlands and Italy. As with his earlier tour, he was expected to follow new developments in France and he was also able to familiarise himself with the classical ruins and antiquities of Italy. Since his previous visit, however, Parisian tastes had changed. The Rococo style with its vegetal forms and curved contours was no longer predominant, and the forms of the antique world, as well as the classical heritage from the Baroque, had come back into fashion. The archaeological finds at Herculaneum and Pompeii had also come into focus.

After his return home in 1756, Rehn eventually put his new knowledge into practice. A moderate version of the neo-Antique style became his trademark, with lingering traces of playful and billowing Rococo shapes. Leaf volutes and shell ornament were replaced by stiff laurel-wreaths and classical urns. Borders which had been rounded became square. But the move towards this new style was gradual and in the first decade following his return to Sweden Rococo forms were still dominant.

The Rococo style was still evident in Rehn's interiors for Charles de Geer's manor house Stora Wäsby in Uppland (1758) which represent arguably the most complete and well preserved suite of rooms created in Sweden during this period. The main building was constructed after Hårleman's designs, but after Hårleman's death Rehn took charge of the interior decoration, working in collaboration with the skilled craftsmen who had formerly worked at the Royal Palace in Stockholm, above all the painter Johan Pasch.

Hårleman had adopted the French principle of arranging the *appartements de parade* on the ground floor, and a suite of rooms runs along the same level as the sumptuous garden, which had been laid out according to the designs of Nicodemus Tessin the Younger. The large square hall in the building's middle axis is divided up by French windows, doors, and large wall panels depicting Italian antique ruins. On one side of the hall is a Salon de Compagnie, a long narrow room whose walls were decorated with *boiseries* and mirrors. The other side of the central hall is flanked by a drawing room whose decoration is dominated by exquisite painted floral ornament framing flying birds. Leading off this room is the Madame de Geer's bed chamber, which is decorated partly with *boiseries* and mirrors and partly with an East Indian silk featuring painted scattered flowers. The painted over-doors have varied gilded wooden frames, and this room includes magnificently rich volutes and scallop decoration.

In 1759 Rehn produced designs for the decoration of the large saloon on the second floor at Sturefors, a building designed by Tessin the Younger at the beginning of the century. Rehn's drawings illustrate a proposal for a *trompe-l'oeil* scheme including marbled walls, niches with gilded sculptures, medallions beneath laurel wreaths, and large scallop shells for the over-doors. He also made sketches for the patterned tiles of the stove, a feature that was to become characteristic of the Gustavian interior.

Rehn's most important commissions for the royal couple during the 1760s were the library (1760) and the adjacent museum rooms (1765) at Drottningholm Palace, and the interiors for the nearby Kina Slott or the Chinese Pavilion (1763) which was built by Carl Fredrik Adelcrantz. Moreover, contemporaneously Rehn received a string of private commissions which were not confined to interiors but which involved the layout of entire manor houses, including the main building, wings, stables, gardens and park buildings. In addition, he designed several interiors for apartments in Stockholm.

In 1772 Gustav III was crowned king and Rehn designed the coronation decorations for Storkyrkan (the Great Church) in Stockholm. Gustav also commissioned Rehn to design new interiors for the State Bedchamber at Stockholm Palace where, for the first time, Neo-Classical forms dominated. In addition to the garlands and festoons that Rehn had used earlier, the walls were divided up by fluted pilasters, and columns framed the alcoves.

Rehn's attachment to the Superintendent's office resulted in a series of commissions for the interior details in many of Sweden's churches. He designed these continuously throughout his career; they consisted mainly of memorials such as epitaphs, but also included altars and pulpits. He was also active as a teacher. His skills as a draughtsman had led to his appointment as drawing-master to Crown Prince Gustav (later Gustav III) in 1751, and he subsequently taught the other royal children. In 1757, the same year that he became Court Intendant, he was appointed professor of Drawing at the Royal Academy. His skills as a decorator were regularly employed for court ceremonies ranging from christenings to funerals.

By the 1780s, new trends in interior design, inspired by Roman and Pompeian finds and grotesque decoration had begun to emerge. These were exemplified in Sweden by the work of Louis Masreliez, whose interiors for Gustav III's pleasure palace, the Haga Pavilion, were the prototype for late-Gustavian interior decoration. Within this context Rehn's work began to be considered outdated, and as a result his commissions for architecture and interiors declined.

Much of Rehn's inspiration derived from French Baroque classicism and the Rococo style, as well as Roman antiquity, with which he familiarised himself on his two foreign trips in the 1740s and 1750s. Also of great significance were the French architectural and pattern books published during that period which had a strong impact on his work. Jacques-François Blondel's books on architecture and interiors were hugely influential in France during the 1740s and 1750s but Jean-François Neufforge's *Recueil élémentaire d'architecture*, which was published in parts over successive years, had a much more formative influence on the Gustavian style in Sweden. The first part of Neufforge's *Recueil* came out in 1757, the year after Rehn's second Paris visit, and the last was issued in 1778. It advocated the adoption of the antique repertoire described as *le goût grec* that entailed a return to Baroque classicism and its classicising forms. The more slavish imitation of antique furniture and painting belonged to a later period.

Rehn's greatness was due to his ability to effect an elegant transformation of French prototypes for Swedish circumstances. A more economical approach to form and ornament and the use of local materials gave the Swedish translation of Louis Quinze and Louis Seize styles its characteristic severity,

but this restraint did not lessen its elegance. Rehn's interiors are exquisitely proportioned, and reflect a clarity and purity of form; they are full of fantasy without being overburdened, whether they be predominantly Rococo or Neo-Classical.

Rehn was also a consummate designer of furniture, and it was arguably in this area even more than in his interiors that his artistry became synonymous with the Gustavian style of the 1760s. This style is most apparent in his designs for mirrors and console tables, in which sober *rocaille* ornament was combined with laurel wreaths, urns, rosettes, guilloche and chevron pattern friezes and meandering borders. Although originally designed for particular interiors, his designs were diffused by craftsmen and were adopted by sculptors, cabinet-makers and decorators in other cities. Rehn was also the leading designer of patterns for silver, wall decoration, fireplaces and tiled stoves, as well as for faience and textile manufacture.

Rehn's work ranged from the decoration of *appartements de parade* to the production of everyday functional objects, and no other Swedish designer has had so great an impact on such diverse areas of artistic activity. His style can be described as a synthesis of the Carolinian tradition with, first, the softening effects of French Rococo and later the restraining influence of French Neo-Classicism. It resulted in a distinctively Swedish style which was not only hugely influential during his own time but whose legacy has endured even to the present day.

URSULA SJÖBERG

translated by Antonia Boström

Biography

Born Stockholm, 18 May 1717. One of the first pupils at the School of Painting at the Royal Palace in Stockholm, 1730s. He was first active as a designer for fortifications, 1739. Went to Paris, where he learned etching under Jacques Philippe Le Bas, 1740–45. Returned to Sweden, via Lyon, 1745, and attached himself to the Office of Manufactures as a textile, pattern and ceramic designer. Active as Carl Hårleman's assistant at Royal Palace, Stockholm, from c.1745. Appointed Crown-Prince Gustav's drawing master, 1751, and later for royal children. Active as designer for the preparations for the Swedish coronation, c.1751. Travelled to France and Germany with the painter Johan Pasch, 1754–56. Appointed architectural draughtsman to the Superintendent's Office, 1753; Court Intendant and Professor at the Academy of Drawing, 1757–89. Active for Queen Lovisa Ulrika at Drottningholm Castle, from c.1760. Provided designs for furniture by Georg Haupt, and ceramics, stage sets and jewellery. Died in Stockholm, 19 March 1793.

Selected Works

The principal collection of Rehn's drawings is in the Nationalmuseum, Stockholm.

Interiors

- 1751–53 Royal Palace, Stockholm (designs for Coronation thrones and canopies for audience room): King Adolf Fredrik and Queen Lovisa Ulrika
- 1758 Stora Wäsby Castle, Uppland (wings, Orangerie, interiors): Charles de Geer
- 1759 Sturefors Manor, Östergötland (interior): Count Nils Adam Bielke
- 1760–70 Drottningholm Castle (library, museum rooms, Marble Cabinet): Queen Lovisa Ulrika
- 1760–70 Erstavik Manor, Södermanland (building and interiors): Herman Petersen

- 1762 Lambohof Manor, Östergötland (building and interiors): Carl F. Sinclair
- 1763 Gimo Manor, Uppland (building and interiors): Robert Finlay and Jean Henri Le Febure
- 1763 Kina Slott, Drottningholm (Chinese Pavilion): Queen Lovisa Ulrika
- 1763 Sturefors Manor, Östergötland (Chinese Cabinet): Count Nils Adam Bielke
- 1763 Leufsta Bruk, Uppland (interior, library, pavilion): Charles De Geer
- 1768 Ljung Manor, Östergötland (building and interiors): Count Axel de Fersen
- 1769 De Geer Palace, Stockholm (building and interiors): Charles De Geer
- 1769 Forsmark Bruk, Uppland (building and interiors): John Jennings
- 1770 Rosersberg Castle (exterior alterations, interiors): Duke Karl, later Karl XIII, and Princess Hedvig Elisabet Charlotta
- 1770 Övedskloster, Skåne (interiors): Baron Hans Ramel
- 1772–75 Royal Palace, Stockholm (King and Queen's state chambers): Gustav III
- 1776 Gripsholm Castle, Södermanland (Grand Cabinet, Queen's apartment): Gustav III and Queen Sofia Magdalena
- 1780 Royal Palace, Stockholm (remodelling of Pelarsalen): Gustav III

Relief Decorations

All modern relief decorations are imitative of older, more traditional work done in moulded plaster, carved wood, and embossed leather. Most originated in the second half of the 19th century and reflect the Industrial Revolution's impact on interior decoration. Costly effects that had previously been available only to the wealthy were now economically mass-produced for the middle classes.

Lincrusta-Walton was one of the first to be produced. It was patented in 1877 by Frederick Walton, who had earlier invented linoleum. Like linoleum, it was made of oxidized linseed oil but, instead of ground cork, it used wood pulp as a binder. The mixture was pressed between heavy rollers, one of which was engraved to create the embossed design pattern. Originally the material was pressed onto a canvas backing, but this proved too stiff and was eventually replaced with a paper backing. Advertised as "Solid in Color! Solid in Relief! Solid in Value!" it was especially strong and durable.

Lincrusta-Walton could imitate any relief material, including plaster, wood and embossed leather. In 1906 the company brought out a tile imitation for bathrooms, and in 1912, a very convincing and wildly popular imitation of an oak dado. One of the great advantages of Lincrusta-Walton over other wall decorations was that it was waterproof and could be easily cleaned. This responded to contemporary concerns about sanitation and earned the material a gold medal at the 1884 International Health Exhibition. Its waterproof qualities also promoted its use on yachts and ocean liners including the *Titanic*. Walton began selling Lincrusta on the Continent and in the United States in 1879. In 1883, the firm of Frederick Beck received the exclusive rights to produce it in America. It was popular in the US and Canada well into the 1930s. In Britain it seemed to never lose its appeal and continues to be produced today.

Other relief materials soon followed Lincrusta. Tynecastle "Tapestry" (or "Canvas") was created by William Scott-Morton, an architect based in Edinburgh. Many writers have given the date for the invention of Tynecastle as 1874, but it was not in widespread production until the 1880s.

Probably the most successful competitor to Lincrusta, however, was Anaglypta, which was patented in 1886 by T.J. Palmer. Palmer was working for Walton at the time and developed the idea of a paper pulp relief material. Walton showed no interest in it, so Palmer set up his own business in 1888. The great advantage of Anaglypta over other embossed papers was that the embossing cylinder was used while the cotton paper was still in the pulp state. It produced a much crisper and firmer design, and, due to the plasticity of the pulp, could take on very deep relief. This was dramatically demonstrated in the

Relief decorations in Frederick Walton's showroom, London, 1900

popular imitation Jacobean ceilings with full pendant drops. Anaglypta was hollow and therefore was much lighter than Lincrusta. Anaglypta also led the way in quality design by employing well-known figures like Christopher Dresser, Adolf Jonquet and George Haité.

Another embossed material was Japanese leather paper, examples of which were first introduced in the 1860s. Made of mulberry paper, those were embossed, painted and gilded to imitate leather. In 1884 Rottman, Strome and Co. set up a factory in Japan to make the papers in Western designs.

Cameoid was a low relief paper introduced by the Lincrusta-Walton Co. in 1898, while Cordelova, another embossed paper, started in Edinburgh in the 1890s. Subercorium, Calcorian, and Cortecine were all rubber-and-cork based materials made in the 1880s in imitation of Lincrusta, but none of them achieved its success or popularity. Salamander was a high relief material made of asbestos fibers, introduced in 1895 and promoted for its fireproof qualities. Lignomur was the only American entry into the market. Based on a wood fiber pulp, it was first marketed in 1880. The firm opened operations in London in 1886, but were bought out by the Old Ford Co. in 1896 and their formula was changed to a paper pulp base.

In 1899 a huge combine called the Wall Paper Manufacturing Company began buying up various independent wallpaper companies. By 1904, they owned most of the relief decoration businesses as well, including Lincrusta-Walton and Anaglypta. Eventually the firm became Crown Ltd. and an offshoot of this company, Crown Decorative Products Ltd., continues to produce modern versions of both materials.

Besides the various paper, resin and wood pulp reliefs, one other important type of embossed decoration to emerge in the late 19th century was stamped metal. In the 1880s Germany had led the way with the development of stamped zinc orna-

ments. These were popular for ceiling details and centerpieces and were often used in connection with plaster. In the United States, the combination of pressed zinc ornaments with a corrugated iron base led to the creation of a decorative, fire-proof form of metal ceiling. Albert Northrup of Pittsburgh was an early promoter and sold his ceilings in England as well as the United States. By the 1890s technological improvements in the production of sheet steel led to the development of stamped ceiling panels in 29 to 30 gauge steel. Sold in sheets that were 12 to 24 inches wide, they could be four to ten feet long. The sheets were also sold as cladding for both exteriors and interiors.

American firms led the way in the development of stamped sheet metal walls and ceilings. In the 1890s British journals began to protest at the American dominance and called for British companies to develop their own version. In 1894 the Emdeca Co. was formed in London and offered sheets of stamped and brightly enameled zinc which were promoted for bathrooms as a cheap and practical substitute for tile. By 1904 the British Stamped Metal Ceiling Co. had been formed and was bragging that it had just installed over 100 metal ceilings in the new Savoy Hotel. Metal ceilings and sidewalls were never as widely-used in Britain as they were in the United States and elsewhere, however, probably because of the availability of Anaglypta, Lincrusta and other cheaper alternatives. Outside of Britain, in Canada, Australia and New Zealand they were as popular as they were in the United States. One Canadian firm has records that show they were exporting their products to South Africa, Japan and India in the early 1900s.

The appeal of all these relief materials was that they were practical, economical substitutes for decorative plaster and other ornamental effects. Their design histories followed contemporary fashion. In the late 19th and early 20th centuries, various revival styles dominated including Gothic, Renaissance, Rococo, Louis XIV, Jacobean, etc. There were also some Art Nouveau patterns, and, in the 1930s, some Art Deco designs. Chiefly marketed to the middle and upper classes, they made ornamental design available to a wide audience.

PAMELA H. SIMPSON

Selected Collections

Examples of embossed wallcoverings survive in the Victoria and Albert Museum, London, the Whitworth Art Gallery, Manchester, and the Cooper-Hewitt Museum, New York. These museums also hold collections of trade catalogues as do the Avery Library, Columbia University, New York, the Winterthur Library and Hagley Museum Library, Wilmington, Delaware, and the Canadian Centre for Architecture, Montreal.

Renaissance

The term "Renaissance" derives from the word "Rebirth" and was used for the first time in 1550 by the painter and biographer, Giorgio Vasari (1511-74). The term broadly defines a multifaceted and complex historical period, generally dominated by an extraordinary interest in classical culture which provided an inexhaustible source of both formal and spiritual models. Through the study of the antique, one current of intellectual thought recognized the fundamental values of individual dignity and rationality, placing man at the centre of the universe, master of his own destiny and of his own history, and capable of dominating nature through strict laws.

The movement was anticipated by Humanism, and from around the second decade of the 15th century until the first years of the 16th century, these precepts manifested themselves in all areas of human knowledge, above all in Italy. Local variations within this phenomenon can be recognized in the artistic sector, and these were determined by the varying degrees of acceptance of these theories and by the personal interpretation of the principal protagonists, as well as by the importance of patrons.

During the Renaissance the predominance of man over nature was expressed artistically principally through the new discipline of perspective. Through the application of scientific rules the study of elements occupying space (lines, volumes, colours, light, and shade) in the depiction or the construction of objects and architecture was established along rigorously mathematical lines. In Florence above all, and mainly thanks to the architect Filippo Brunelleschi (1377-1446), the rules of perspective were introduced in each artistic field. Moreover, the exaltation of man also manifested itself through a distinct tendency to individualism: as a result the artist and the scholar were held in positions of unprecedented importance within a society dominated by open-minded and cultured princes, who were also passionate seekers of spiritual and material pleasures.

Renaissance courts became centres for the pursuit of knowledge, for new discoveries, and for the collection of the most prestigious artistic and literary expressions of the past, as well as continuously evolving in all the areas of the Liberal Arts. The image of the sovereign-patron was created through rich interiors and lavish patronage, and he was always conscious of his ability to reinforce his own power by eliciting the respect and admiration of his subjects.

Contemporary craftsmen were also affected by the mania for cultural renovation and attempted to give modern and correct forms to their wares. A critical attitude to the examination of the classical world avoided pure imitation, and led to original interpretations. Indeed, even when ornamental and formal elements deriving from the antique were faithfully repeated, these were always couched in the context of modern taste; a taste which paid more attention to substance than to form. In Renaissance decoration ornament is always contained within rigorous limits. Even when an object or interior is ostentatious, nothing is included by chance and everything corresponds to a unified and coherent project. While there was no shortage of important religious patronage, Renaissance artistic expression was always closely linked to secular needs. It is noteworthy, that even when designing for ecclesiastical interiors, the artistic motifs employed often had an exquisitely profane appearance.

The palace became the permanent and sumptuous seat of patrician life, and during the course of the Renaissance in general the home assumed a particular significance. In order to be more decorous and comfortable, and to guarantee privacy, palaces became more spacious. A contemporary commentator declared that it was preferable to have a "building of modest beauty, but perfectly comfortable", than one that was "extremely beautiful and uncomfortable". For this reason great importance was attached to the skill of the architect in organizing a rational distribution of the interior spaces in correspondence with the exterior openings (which by this date were considerably larger than in the past), and with the dimensions of the rooms and the orientation of the building itself.

The owner's bedroom was the central nucleus, described in contemporary documents simply as the *camera*. This was preceded by an antechamber and by one or more rooms (*sale*), all corresponding with the entrance. The *camera* was followed by a small study and by other private spaces, from which it was possible to exit by a service staircase, or reach a garden which was invariably cultivated with great care.

The *sala* (or hall) was used predominantly for gatherings, and on the occasion of banquets a table constructed from planks and mobile trestles would be erected here. The pivotal element was the large stone or marble fireplace, which in noble residences was finely decorated with classical motifs. It was also normally equipped with wrought-iron utensils, including firedogs, andirons and fire-guards, which were indispensable, as frequently the fireplace would also have been used for cooking. During the 15th century its design became characteristic: it was excavated from the thickness of the wall, framed by a mantelpiece and two mouldings or scrolls attached to the wall, and variously decorated with coat-of-arms, minute figures, or garland reliefs. Notable fireplaces are those in the *sale* at the Ducal Palace in Urbino, at the Palazzina Marfisa, and the Palazzo Schifanoia in Ferrara, as well as in many

Renaissance buildings in Florence. The refined decoration of these and other fireplaces was always executed by renowned sculptors, or carved after their designs and introduced into the architectural project.

Portals were made from stone and wood, decorated with egg and dart, dentils, shells, fluting, fillets, and closed with massive wooden doors which were often carved or inlaid. Often the decoration repeated the decorative motifs of the fireplaces and the ceilings. The walls were generally covered with wooden panelling, usually up to shoulder-height and sometimes only along one wall, and by woven and embroidered textiles. The panelling of the Sala dell'Udienza of the Collegio del Cambio in Perugia is notable for the magnificent refinement of its carving and the variety of subjects depicted in the inlays. This was produced during the last years of the 15th century by Domenico del Tasso, who belonged to a famous dynasty of skilled woodcarvers. More rarely the walls were decorated with frescoes and tapestries. A rare example of Renaissance tapestries to have survived in a good state is the Trivulzio series (Milan, Castello Sforzesco), depicting the *Allegory of the Months*, which were woven after cartoons by the Milanese painter Bramantino.

Ceilings were of a variety of types; wood was available to all sections of society. The most common ceiling was made from projecting wooden beams, decorated with vivid coloured frames or with coats-of-arms and shields/ciphers. In other cases vaulted ceilings were preciously decorated or painted in fresco, with coffered scenes in classical frames, and with *trompe-l'oeil* effects. Stucco and wood often formed interlaced patterns.

As the Renaissance progressed, cornices grew larger and classical motifs were introduced. Gilding was quite common in the interiors of the most magnificent palaces in Florence, as well as in Venice and in Mantua, above all in the most sumptuous ceilings. These were often in carved wood with coffers decorated with sculpted and painted elements, or in terracotta or stucco. A coloured and glazed terracotta ceiling by the Della Robbias is to be found in the Museo del Castello Sforzesco, Milan. A sumptuous example of a coffered ceiling is in the Sala degli Stucchi at the Palazzo Schifanoia in Ferrara, executed by Domenico de Paris around 1480 under the direction of the architect Biagio Rosselli. The ceiling of the Sala di Eleonora di Toledo in the Palazzo Vecchio, Florence, completed by the del Tasso brothers in 1482, is made up of hexagonal coffers with precious frames and central bosses with six lilies. The ceiling of the Room of the Horses, decorated in c.1530 by Giulio Romano and assistants, shows decorative interlacing and an interplay of beams and joists. Rich texture is provided by carved and gilded motifs set in panelled coffering. Michelangelo's exquisite ceiling for the Vatican's Sistine Chapel (1508–12) is based on painted *trompe-l'oeil* architecture with emphasis on the structural axes. In nine rectangles, large and small, are painted narratives from the Bible – animals, humans, and architecture – in a precursor to Mannerism.

In some Central Italian locations, for instance in Pesaro, instead of containing painted wooden plaques, the ceilings were occasionally decorated with series of tiles in maiolica, or unglazed terracotta decorated with portraits and other naturalistic subjects. In the 16th century combinations of materials were used, including wood with painting, stucco, or metal. The

Studiolo at Urbino has classical coffering interspersed with circular bosses. In Italy, wooden ceilings known as *soffitto morto* (dead ceiling) were fixed to the beams by pegs, rather than being part of the actual structure of the building. False ceilings incorporating cloth or leather were sometimes used to retain heat in winter.

The most sumptuous floors were in stone or marble, inlaid in geometric patterns or with classical decorations. Sometimes these echoed, or at least complemented, the ornamental themes of the ceilings. Floors made up of terracotta or maiolica tiles were very widespread, the latter being used particularly in smaller spaces such as a *studiolo*, or in family chapels in churches. Important examples are the tiles in Isabella d'Este's small private rooms in the Ducal Palace in Mantua, decorated with heraldic designs and symbolic motifs by Antonio de' Fedeli's workshop in the 1490s. Other examples of this type of decoration survive in their original locations in some Neapolitan churches, in Siena Cathedral (Cappella Piccolomini), in Rome (Cappella Basso della Rovere in Santa Maria del Popolo), in the Vaselli Chapel in San Petronio in Bologna, and in many other cities. Other complexes, now dismantled, have entered museum collections, including, for instance, the precious maiolica tiles with strongly characterized portraits now in the Galleria Nazionale in Parma. These came from the chamber of the abbess of the Convent of San Paolo, and were produced by a Pesaro workshop around 1471–82. Frequently both the floors and the walls and window sills were covered with precious oriental carpets; above all in Venice, where trade and artistic contacts with the East were very active.

During the Renaissance two spaces in the house assumed a fundamental importance which differs considerably from the present day. These were the bedroom and the *studiolo* or study. The *camera* (bedroom or chamber) was without doubt the central living space. It often had a square ground-plan, unlike the *sala* or hall which was rectangular, and was a private space for the owner, and the place where he could receive his most intimate friends. The Camera degli Sposi in the Ducal Palace in Mantua, frescoed by Andrea Mantegna between 1465 and 1474, is an exceptionally magnificent example of this type of room. Based on illusion, with painted pilasters and with a carved mantelpiece being the only three-dimensional device, its allegorical ceiling incorporates a central circular *trompe-l'oeil* fresco depicting a blue sky with white clouds, adult figures, putti, and a peacock looking over an elaborate interlaced balustrade which, in turn, is framed by fruit and foliage.

If the owner was a lover of comfort he might forego mural paintings and prefer to have his rooms hung with luxurious and heavy tapestries which gave warmth to the relatively sparsely furnished space. The paucity of furniture did not, however, mean that these aspects of the interior decoration were of little importance. On the contrary, in Milan, Venice, and Florence the woodworkers' guilds had precise laws and duties relating to their techniques. Moreover, it should be remembered that they normally worked on the projects of important artists, a fact which underlines the degree to which patronage determined the production of luxury products.

The furnishing of the *camera* was principally characterized by textiles, including brocades and silk velvets, and, to judge

Renaissance: *The Birth of St. John the Baptist*, fresco by Domenico Ghirlandaio, Santa Maria Novella, Florence, 1480s

from the few surviving examples, these were of an extraordinary refinement. In addition, delicate textiles which were easily worn out were periodically replaced. Contemporary paintings and frescoes offer alternative illustrations when concrete evidence relating to the documentary records of textiles is lacking. Scenes of the Birth of the Virgin or of St. John the Baptist are useful, since these are usually depicted in interiors decorated in contemporary taste. For instance, in Domenico Ghirlandaio's fresco in the church of Santa Maria Novella in Florence (c.1480) the scene takes place in a *camera* partly hung with textiles, and shows a large bed with base and headboard, decorated with classical motifs. Another informative painting is the *Apparition of the Virgin to Lodovico il Moro* (Museo Poldi Pezzoli, Milan), which depicts the Duke of Milan in his own bed, covered with heavy tapestries. A number of drawings now in the Fondazione Querini Stampalia in Venice show designs for beds, all of which were hung with luxurious textiles. This guaranteed shelter on all sides and became a veritable room within a room. The alcove of Federigo da Montefeltro in the Palazzo Ducale in Urbino is also presented as a dwelling space, in this case in wood entirely decorated with fictive marble friezes in the classical style and the duke's coat-of-arms prominently repeated twice either side of the door. Wooden beds with tall inlaid and carved headboards, and a high wooden base on which woollen or horsehair mattresses were arranged were also quite common. This model also allowed for a baldachin canopy, covered with embroidered curtains.

Paintings depicting both sacred and secular interiors also provide significant visual testimony of the furniture present in these Renaissance environments. Important examples of 15th-century furniture survive in the principal public collections of decorative arts and in some notable palaces, though often 19th-century reconstructions of furniture using parts of older, now lost, structures are displayed as original Renaissance pieces. Other than the bed, a few chairs and a small travelling-trunk or bench-chest there was little other furniture, in the modern sense, in the *camera*.

There was always the *cassone*, in which young women kept their dowry, and which after their marriage became part of the furnishing of their spouse's house. These containers were often preciously decorated with scenes alluding to fertility, to faithfulness and to other moral virtues suitable to a devoted wife, or with more political and territorial subjects such as the joining of two important families. Inside might be an intimate portrait of the bride or groom. 15th-century *cassoni* often have an architectural structure: their principal face is divided into three squares, between which the heraldic arms of the two families joined by marriage were painted. A good collection of painted *cassoni* and panels from dismembered interiors is kept at the Musée de la Renaissance at Ecouen, and other interesting examples are in the Castello Sforzesco in Milan and in London's Courtauld Collection. Additional examples in inlaid woods, produced by inlay-specialists such as Canozi da Lendinara, Giovanni da Verona, Fra Damiano da Bergamo, and the de Blasio family active at the Central Italian courts, are

in the shape of a sarcophagus and are decorated in minute geometric patterns.

Intarsia (inlay), small pieces of stained or shaded wood set into a solid dark background, had an enormous success in the Renaissance because it fully satisfied the dictates of taste. It was suited to simple geometric decoration and rigorous ornamental designs with spirals, acanthus leaves, and garlands. Moreover, inlaid work allowed the application of the rules of perspective – especially when an artist's design included views – allegorical and religious figures, ruined and intact buildings, naturalistic compositions, and much emphasis on illusionistic devices in *trompe-l'oeil*. Intarsia, used initially to decorate churches, was used in secular interiors primarily for furniture (including *cassoni* and cabinets), panels, and architectural woodwork.

It was also particularly adapted to the *studiolo*, which was without doubt the Renaissance space *par excellence*: a small room entirely fitted with cupboards of inlaid wood. In luxurious interiors these cupboards were finely decorated and painted, and sometimes carved and inlaid with perspective views, allegorical figures and compositions. Precious manuscripts, illuminated codices, printed volumes and collections of antique gems, medals, plaquettes, and oriental rarities were housed in these: in fact, all those examples of manufacture that contributed to the curiosity and yearning for pleasure of their owner. The *studiolo* created in 1476 for Federigo da Montefeltro, Duke of Urbino, by Baccio Pontelli, after designs by Sandro Botticelli and Francesco di Giorgio is made up of two inlaid sides: the taller side has fictive shelves, alternating with niches in which the Theological Virtues and the portrait of the duke are placed, and fictive openings. The other lower side has benches with cupboards which open in their base. The most striking features of this space are the panels which simulate the divisions of a bookcase with semi-open trellised doors, and which allow a glimpse of the heterogeneous collection of objects housed within: amphore, books, a watch, an ink-well, a parrot-cage, and musical instruments.

Studioli, cabinets, alcoves, *cassoni* all correspond to a similar conception of life, in which there was the need to preserve personal and private objects in perfect architectural structures. The same attitude applied to smaller containers for the housing of precious and small objects. Especially typical of the period were small jewel-caskets in soft woods covered in musk paste (gilded *pastiglia*), on which decorations depicting stories from Roman history, biblical themes or profane legends were applied. The centre for this type of production was in Ferrara, owing to the fashion for it during Leonello d'Este's rule.

Most splendid among these caskets is the one carved from rock-crystal with incised scenes from the Life of Christ along its sides, created for Clement VII by the Vicentine artist Valerio Belli (1468–1546). This is one of the most representative objects of the period, for it combines both Roman and Venetian interpretations of classicism. Other rock-crystal objects carved on their reverses were vases and candlesticks. The tradition of carving rock-crystal was closely linked to the passion for collecting antique gems, especially by collectors such as Pope Paul II (Pietro Barbo) and Cosimo il Vecchio de' Medici. Their collections now form part of the Farnese collections in the Museo Archeologico, Naples.

Ceramic and glass enjoyed an extraordinary development during the 15th century. Initially following the ornamental patterns of Islamic ceramics, designs eventually evolved towards a more marked adoption of Renaissance forms and subjects. Progressively from the beginning of the century the spare and incised designs of medieval ceramics were replaced by *stannifero*, which was relatively impermeable and adapted to decoration with more precious designs. Following the examples of fine lustre-ware imported from Valencia, Italian maiolica evolved rapidly, developing from the earlier designs dependent on Islamic models into a more mature and classical appearance. The design of ceramic forms also became more complex and more functional. A large part of the production of maiolica during the Renaissance period was for pharmacies, which had assumed a more important role with the development of Humanism. Ceramics were also important for the court environment and the princely table, above all at the Aragonese court in Naples. Maiolica cups and large presentation platters decorated with the portrait of the beloved were given as gifts on the occasion of engagements or weddings. From the end of the 15th century the most precious productions manufactured by some factories, such as Deruta and Gubbio, were given a third firing which fixed the metallic lustre-glaze.

The attempt to emulate or even supersede imports from the Middle East is also evident in Murano glassware dating from the second half of the 15th century. Like ceramics, the ornamental designs of the hanging lamps, chalices, flasks, cups, and ewers dating from the earlier period display Islamic traits which were slowly replaced by more typically Renaissance patterns. This glass is sumptuously gilded and has polychromed decoration, applied both to milky and to coloured grounds.

The general trend in Italian Renaissance interiors was a development away from sparsely furnished rooms in which purely functional objects and pieces of furniture were arranged, to interiors both of greater architectural complexity and of more luxurious decorative appearance. Function and decoration were more harmoniously combined, and the use of classical motifs and designs introduced a rationality and a synthesis of the different elements of an interior. The application of classical motifs pervaded all areas, from fixed architectural members to small functional objects in daily use.

In Northern Europe medieval fashions in interior design continued longer into the 15th and early 16th centuries. Only with the spread of printed designs and books of ornament at the beginning of the 16th century did antique motifs become more generally familiar and begin to be introduced into architectural designs and interiors. These books included Sebastiano Serlio's Books I–V of his treatise on architecture (1537–51), Hans Blum's *Five Orders* (1550), Palladio's *Architecture* (1570), Vredeman de Vries's books on the orders and of ornaments, and an English book, *Chief Groundes of Architecture* (1563).

The conquest of much of Italy by the French, and later by other armies from the North, also helped spread knowledge of Italy's elaborately decorated palaces and houses. In 1492 Charles VIII of France, a country with an indigenous Gothic style but no great tradition of mural painting, imported 22 Italian artists and craftsmen. Initially Gothic and Renaissance

Renaissance: Villa Madama, Rome, by Raphael and Giulio Romano, c.1518–20

were combined, somewhat uneasily, and it was not until the reign of François I, when Italy was already moving to Mannerism, that France adopted a Renaissance style of her own, initiated to a great extent by architect Pierre Lescot (1500/10–78), who was responsible for a new wing in the Louvre that included a ground-floor gallery supported by four sculptured caryatids by Jean Goujon, and Philibert de l'Orme (c.1512–70).

Typical of French Renaissance style was François I's château at Amboise, above the Loire, which he turned from fortified building to elegant château. This was followed by his remodeling of the Château de Fontainebleau, with Italian painters Giovanni Battista Rosso (Rosso Fiorentino) and Francesco Primaticcio, and teams of French and Flemish artists. The resulting style, known as the School of Fontainebleau, was credited with introducing France to the Renaissance, although the decoration, with its sense of drama and innovative combinations of high-relief stucco with fresco panels, nymphs, putti, scrolls, and strapwork, might more accurately be considered Mannerist. Particularly noteworthy is the 64-metre Galerie François I, started in 1535. Sadly, the original decoration no longer exists.

The late Renaissance château at Ancy-le-Franc, designed by

Serlio who had been brought to Fontainebleau by François I, included elaborate mural decoration executed by or under the direction of Primaticcio. The vast Guard Room is an amalgam of Italian and French design. Covering the entire floor of one wing, it has windows on both sides and a beamed ceiling painted with Italian-style decoration, a patterned tiled floor, and French fleur-de-lis frieze. A number of Italian classical revival motifs were introduced to the château at Gordes in the Vaucluse, c.1525, with a magnificent Renaissance chimney-piece that stretches the length of an entire wall, including the doors. Classical motifs here include pilasters, triangular pediments, scrolls, acanthus leaf friezes, and shell-headed niches.

Italian classical interiors were evident at the Munich court, and England, slow to relinquish medieval style, adopted classical motifs in a somewhat haphazard manner, such as in the plaster ceilings at Hampton Court (1536) and, in isolation, the Doric chimney-piece at Lacock Abbey in Wiltshire. England's initial adoption of Renaissance style amounted more to room planning, with a greater focus on privacy in the home and small chambers rather than the grand gallery. The style came later to English galleries, as in the magnificent 116-foot example at Lanhydrock House in Cornwall which is decorated in Old Testament themes and has a ceiling with decorative

plasterwork and pendants. Architectural patterns in the North did not become fully classicised until the late 16th and early 17th centuries with the introduction of Palladianism.

Renaissance Revival

“Renaissance Revival” is a term most often used of architecture; less frequently it has described styles of sculpture, interior decoration, furniture and even jewellery. Quite evidently it refers to a revival of the forms of the Renaissance and it identifies styles of building throughout Europe and America in the 19th and early 20th centuries that borrowed the forms of the language of Renaissance architecture, such as symmetry, ashlar masonry, columns, rectangular windows, entablatures and the

like. But this description is not without its difficulties, for Renaissance architecture was itself a revival of an earlier style. And if we think of the revival of classical architecture that had taken place a century earlier – namely Neo-Classicism – it can be difficult to know if what is evident in the Renaissance Revival should not merely be taken to be a continuation of Neo-Classicism, or a revival of the Renaissance, or a return to antiquity itself. Also, the Renaissance took on many forms different from those in its native Italy in other parts of Europe, as native and foreign influences mingled and mixed with one another. Thus, although the Cathedral of Dormition in the Kremlin, Moscow (1479) and the Château at Chambord in France (1525) were buildings with Italian influence designed by Italian architects, they are unlike anything built in Renaissance Italy. And therefore a Russian or French revival of these forms might be described either as a reference to the Italian Renaissance or to buildings of their own native traditions.

Perhaps the term Renaissance Revival can best be reserved for those buildings in the mid- to late 19th and early 20th centuries that consciously referred to styles of Renaissance architecture, whatever these were. Such a definition would allow for the inclusion of both buildings in Italy that were, like those of the Renaissance, regular and classical, and also the great mid-century castles of France that were modelled on a building like Chambord, together with houses in England taken from this French style, or those sometimes disparagingly called Tudorbethan or Jacobethan of the early 20th century that had their sources in the buildings of the Elizabethan architect Robert Smythson. The answer to the definition is to understand the particular historical situation in which the style, or styles, were used.

The forms of the Renaissance Revival in Italy are perhaps the most precise. Here the style is often called “Cinquecentesimo” and, in its recalling of the past, is identified with the artistic consequences of a newly united Italy under Victor Emmanuel II (reigned 1861–78) and Umberto (reigned 1878–1900). The Revival took two forms; from the earlier Renaissance, perhaps somewhat plain, as at Giuseppe Bollati’s Piazza dello Statuto, Turin (1864); or a more florid classical style, known also as the “stile Umberto” or the “stile Floreale”, that was as much influenced by the French Second Empire style. The work of Gaetano Koch (1849–1910) is especially important within this context, particularly in the building of Rome after the unification of Italy, and also that of other architects in Rome such as Guglielmo Calderini (1837–1916) and Giuseppe Sacconi (1853–1905). Beyond the capital, Giuseppe Poggi (1811–1901) was notable in Florence; Carlo Ceppi (1829–1921) in Turin; Pietro Bianchi (1787–1849) in Naples; and Rodolfo Vantini (1791–1856) in Brescia.

In France, the Renaissance Revival could follow the models of the local Renaissance, as in some of the country houses influenced by Chambord, for example the work of Théodore Olivier (1821–1899), and houses like the Château de Comacré, Sainte-Catherine-de-Fierbois (1845–48) and the Château de Challain-la-Potherie, Maine-et-Loire (1846–54). Even more important were the buildings of the Second Empire period after 1852 whose effect, albeit florid and pompous, can be seen all over the world. The first examples were the extensions to the Louvre done between 1852–57 by Louis Visconti (1791–1853)

and Hector-Martin Lefuel (1810–80); from these came any number of works by Jacques-Henry Espérandieu (1829–74), August Bailly (1810–92) and Joseph Magne (1816–85).

Outside France, Renaissance Revival influences were evident in the work of Cuthbert Brodrick (1822–1905) in England, in that of Cornelis Outshoorn (1810–75) in Holland, in that of Vilhelm Peterson (1830–1913) in Denmark, and in that of Joseph Poelaert (1817–79) in Belgium. And in America it is possible to discern something of the style of the Second Empire in the late 19th and early 20th century work of McKim, Mead and White, as at the Henry Villard House (1882–86), the Boston Public Library (1887–95) and Columbia University, New York (1893–1902), and later in the rebuilding of Philadelphia in the 1920s and 1930s. The case of America is somewhat problematic, however, for in the absence of original Renaissance models, revivalist buildings might also be termed Neo-Classical. And yet in the Drexel & Company Building (1925–27) by Charles Klauder (1872–1939), there is the design of a bank that goes back to the models of the simpler forms of late 15th century Florentine palaces, also owned by bankers.

So far as England is concerned, notable examples of Renaissance Revival architecture on a grand scale can be seen in Jacobethan buildings such as Harlaxton Manor (1831–37), designed by Anthony Salvin (1799–1881) in the style of Longleat House; Mentmore built in the 1850s by Joseph Paxton (1801–65) on the model of Smythson's Wollaton; and Charles Barry's Town Hall, Halifax (1859–62) that seems clearly based on Burghley House. Less prestigious but far more numerous were the many clubs, banks, offices, hotels and smaller terrace houses erected in this style, particularly in the latter part of the century when the High Victorian Renaissance Revival merged almost imperceptibly into the late Victorian Free Renaissance style exemplified in the work of Richard Norman Shaw.

In design terms, the Renaissance Revival was equally eclectic and involved the revival of the whole repertoire of Renaissance ornament both from Italy and northern Europe. Interior decoration in the Renaissance manner was comparatively rare before the mid-century but the style was given a great boost in England by its being taken up by Prince Albert and the design establishment. Prince Albert had collaborated with the builder-architect Thomas Cubitt in the rebuilding of Osborne House, in the Isle of Wight, in the 1840s as a summer residence for the royal family. He was also closely advised by Sir Henry Cole, who was in charge of London's School of Design from about 1847, and who in his role as the manufacturer "Felix Summerly" promoted designs by Renaissance-orientated artists such as the sculptor John Bell and the painter Richard Redgrave. Perhaps the most important British designer associated with the Renaissance Revival in the mid-century was Alfred Stevens who taught drawing, painting, ornament and modelling at the School of Design from 1845, and who exercised a strong influence on the promotion of the Renaissance style for decoration. Stevens also executed Renaissance decoration himself, first at Deysbrook, in Liverpool (1847), and later at Dorchester House, London (from 1856), and was responsible for several influential unexecuted schemes, including one for the decoration of the Reading Room at the British Museum. His most significant

pupil was Godfrey Sykes who designed much of the terracotta and ceramic ornament in the South Kensington Museum.

Among the features that made the Renaissance Revival so popular were its sense of luxury, adaptability, and commercial viability. Rarely applied with much academic rigour, it was ideally suited to the requirements of manufacturers who could provide furniture and ceramics with a Renaissance feel simply by applying some appropriately Italianate surface decoration. Sometimes these pieces might be especially ornate, like the cabinet designed by Gottfried Semper for the Paris Exhibition of 1855 that was made by Holland & Sons, or the Victorian Majolica range pioneered by Leon Arnoux for Minton's. But equally, Renaissance-style furniture and dinner services were being mass produced by many commercial manufacturers.

The "Free Renaissance", which evolved within the academic framework of the Ecole des Beaux-Arts in Paris in the middle decades of the 19th century, took in all shades of classicism, including "Louis Quinze" Rococo, which was seen as an extension of the "Louis Quatorze" Baroque, and incorporated many features of Italian and French 15th and 16th century Renaissance and Mannerist work. These consisted of architectural forms such as pilasters and pediments, sculptural figures of classical gods, caryatids, grotesques, masks and animal supports, and elaborate inlays of woods, stones, metals and ivory, variously known as intarsia or certosino work. The Renaissance work of the 1880s and 1890s employed much of this decorative vocabulary and there was much enthusiasm for inlaying. Some of the most notable expressions of palatial building in this style in America are Richard Morris Hunt's châteaux at Newport, Rhode Island of the late 1880s and 1890s.

By the last quarter of the 19th century, interest in Italianate forms had given way in England to a greater emphasis on Northern Renaissance prototypes. Old English, French and Flemish Renaissance styles of furniture and decoration were deemed particularly suitable for large living-halls, dining rooms and billiard rooms. Waring & Gillow's were credited by *The Cabinet Maker* in 1880 with "taking the lead in Jacobean" and bulbous-legged tables, court cupboards, panel-back chairs and cane seated high-back chairs were all reproduced in great quantities, as were wallpapers and imitation leather panels with Renaissance strapwork and formalised fruit designs.

Restaurants

Restaurants have been described as the “window to our culture”, reflecting the trends of the period in which they were established. As a pure service industry, visual impact is vital, since it signifies the type of food and service one might expect.

Food and shelter have been fundamental requirements of the traveller throughout the ages. As the influence of the monasteries declined, inns emerged as providers of en-route refreshment, their structure reflecting architectural changes in house building of the period. Timber-framed inns acquired brick and tile veneers, stucco and weatherboarding as styles evolved. The typical inn of c.1420 had windows with wooden shutters but no glass. A low-ceilinged entrance room with heavy beams and a narrow table in the centre, surrounded by stools, led to a larger main room with an open-timbered roof, a screen at the far end beneath a carved gallery and a stone hearth containing a log fire. Grotesques supported the upper part of the chimney. There was little oak furniture, but close to the fire stood a large table; rats ran over the rush-strewn floor.

A description of the Angel at Grantham, built in the late 14th century (Richardson and Eberlein, 1925), describes an oriel window on the ground floor room to the left of the entry; the first floor was made up of a long room with a mullioned bay window at each end. A semi-circular oriel with a raised seat in the centre looked over the Market Square. The floor covering was once again rushes and there were tapestries of biblical subjects on the walls. Food was served on wooden platters, with knives and wooden salt cellars; pudding was served on the reverse of the platters.

Inns of the 16th century began to acquire Renaissance detail. After the suppression of the monasteries, most were adapted from old hostels and began to attract the business traveller rather than the pilgrim. Towards the end of the century, rich travellers were catered for in special rooms, often oak-panelled with richly patterned plaster ceilings, ornate chimneypieces and heavily carved oak furniture.

The Restoration in 1660 brought renewed prosperity, and inns began to cater for the stagecoach trade on regular routes. Scrubbed floors and large, sanded tiles; spindled Windsor chairs with Hogarth backs, panelled settles, oak stools and “cricket” tables made up the furnishings of an 18th-century inn and the deep fireplace had recessed seats. During the second half of the century, in the better type of inn, furniture might be made of mahogany; there were repp and chintz curtains, candles and needlework bell-pulls, marble fireplaces and silver on the dining table.

Richardson and Eberlein describe a Dutchman arriving by

sailing packet at Harwich, impressed by the facilities afforded by the White Hart Inn. Breakfast was elegantly served – a black Wedgwood basalt teapot with classical figures in low relief; a silver cream pot; Staffordshire ware cup and saucer; lacquerwork tea caddy; scalloped silver spoon; a copper scuttle shaped like a Roman helmet and fireplace with polished steel grate and fender, vase tops on the poker, shovel and tongs. There were no table napkins at dinner, although there was a clean cloth on the table, silver utensils, glass dishes containing fruit and a mahogany wagon with Cheshire cheese. The Queen’s Head Chamber, at the 18th century Red Lion in Northampton, contained 90 yards of tapestry, a mahogany dining table, Chinese wallpapers, Virginia chairs and Japanese tea tables.

In the mid-19th century public dining rooms tended to be dingy and utilitarian. Basic food was still eaten in the bars of taverns and inns. An 1880 picture of the Cock Tavern, Fleet Street (opened during the 16th century and mentioned by diarist Samuel Pepys) shows stark wooden panelling, benches and long tables divided by wooden partitions into cubicles. It catered only for men. A few luncheon bars and clubs existed in city centres for gentlemen who also ate in chop houses. The first London restaurants were set up around 1830, serving mainly French food, but until the end of the century middle-class women did not eat in public.

The emergence of the railways led to the need for refreshment facilities at large railway stations; the middle-class dining room emerged from around 1870, and restaurants developed alongside hotels. Possibly the most distinguished railway restaurant is in Paris, the Train Bleu at the Gare de Lyon, opened in 1901, with its embroidered curtains, moulded ceilings and Mediterranean murals. In northern England, the First Class Refreshment Room at Newcastle Central Station (1893) included long tables, richly patterned carpet, hanging lights with glass shades, arched windows, a long, oblong skylight, marble pillars and panels of decorative tiles on the walls.

Spiers and Pond, two Englishmen who had provided restaurant facilities in Australia, opened the Holborn Viaduct Hotel, London, and were responsible for upgrading refreshment rooms at stations elsewhere. London’s Criterion Restaurant (1873) and the Gaiety Theatre and Restaurant were also opened by Spiers and Pond – the latter providing musical entertainment, and restaurants decorated in different styles, including the Café Monico, Romanos, the Trocadero. These were ornate and luxurious, but seldom comfortable.

London saw the emergence of a number of large hotels with important restaurants. T.E. Collcutt in 1889 designed the Savoy Hotel in the Strand for Sir Richard D’Oyly Carte, with William Morris wallpapers and William De Morgan pottery. The outdoors came inside at the Palm Court of the Midland Hotel, Manchester, designed in 1898 by Charles Trubshaw. Opened for business lunches and informal concerts, it was here that Charles Rolls met Henry Royce in 1904. The walls were lined with trellis work and there were wickerwork tables and chairs, palms, ferns and hanging baskets. Pillars of trellis supported the roof, giving the impression of a huge conservatory.

César Ritz and Escoffier brought in Charles Mewès, an architect, and Arthur Davis to design the Ritz Hotels in Paris and London. In London Mewès and Davis introduced a luxu-

rious Louis XVI style in 1903, replacing the eclectic decor of the previous decade. The vestibule contained a magnificent circular carpet in Aubusson style. At the Carlton Hotel, Haymarket (1897–89), Mewes and Davis painted the walls, as Ritz considered wallpaper unhygienic. Later, the building suffered war damage and was demolished.

Around the turn of the century hoteliers turned to large furnishing companies such as Maple's and Waring and Gillow to provide total schemes of furniture and furnishings. The Arts and Crafts style in restaurant decor was epitomised in Ridgways Café, Manchester, where T. Arnold Ashworth introduced an elaborate curved cornice with murals in a room set aside for lady diners. Walls were in painted Gothic-style panelling. In Glasgow, the growing Temperance Movement led to the importance of the tea room. The first was opened in 1875 by Stuart Cranston, a tea dealer.

Kate Cranston's famous tea room opened in 1896 in Ingram Street, in the decor of the Aesthetic Movement – a sunburst on the ceiling and touches of Whistler's Japonisme replaced an ambience of the baronial hall. For the Ladies' Lunch Room in Buchanan Street, designed by George Walton (1867–1933), a bank clerk turned designer, Charles Rennie Mackintosh designed a frieze of white ladies silhouetted against gold suns and spotted with purple and pink roses. The Ruhl teashop, designed in 1927 by James Carruthers in Sauchiehall Street, exists today only in the remnants of an Art Deco lift in polished wood and brass, wooden panelling on the first floor, fireplaces and cornices. In its heyday there were paintings on the walls by well-known Scottish artists, causing it to be known as "The Unofficial Art Gallery of Glasgow". Another tea shop-art gallery, William Skinner's of 1935, had luxurious French-style furniture, Boulle clocks and Louis chairs. Taken over by John Sword after World War I, it displayed paintings by artists Russell Flint and Laura Knight.

A well-known design partnership, Guthrie and Wells, known as "artistic decorators", was responsible for the "Tea Rooms, Lunch Rooms and Grill Rooms" of Glasgow's Ca'doro in the 1920s. The hall of the self-service restaurant was faced with marble and Caen stone; the "Venetian Tea Room" included a view of Venice commissioned from J.W. Ferguson, and in the lounge-buffet area there were strong colours, geometric patterns, varnish, lacquered metal and decorative panels of stylised dancing Deco figures.

Guthrie and Wells also designed Cranston's Renfield Street premises, c.1924. The tea room ceiling was decorated in shades of yellow "Duresco" with highlights of bright green and soft black and gold, red pay boxes and panelling decorated with moulded gilt festoons and masks. The 56-foot square carpet in mulberry, green and gold on a fawn background, was made by Templeton's. The balcony lunch room had an orange-yellow roof and glazed green walls.

Between the wars London restaurants were brought up-to-date for the younger generation. Rumpelmayer's (1906) in St. James's became Prunier's, with a decor designed by J.P. Mongeaud and W. Henry White and Son. There were two dining rooms in Art Deco style – one with a circular lift hoist and illuminated ceiling; the other with green walls and a green glass lighting panel in V-shaped troughs, complemented by pink opalescent lighting from the cornice. A zig-zag glass screen divided the restaurant from the service area.

The 1920s saw the heyday of dining and dancing, led by the tastes of the Prince of Wales, later Edward VIII. A number of restaurants introduced dance floors and cocktail bars, among them Fisher's Restaurant, New Bond Street (1932). Architect Raymond McGrath incorporated sunlight nitrogen tubes in a serpentine curve, giving a golden glow to the lighting in the basement that was reflected in brilliant-cut glass mirrors; an effect emphasized by coral-red columns, a pale yellow ceiling and straw-coloured walls. The upholstery was in a contrasting grey-green stripe, and the dance floor was in Austrian oak strip inlaid with hornbeam and walnut. The ground-level bar had a counter fronted with illuminated ferro-glass and a top of polished travertine; walls were in light-reflecting green metallic paper.

Glass and light featured strongly in the Art Deco restaurant. At Odedenino's Café, 54–62 Regent Street (1928–29), designers Yates, Cook and Derbyshire transformed the old Imperial Restaurant with mirror glass. Sunbursts etched in mirror glass above dado-height were reflected in the ceiling and the impression was of being in a crystal box. Seating was provided by semi-circular chairs in tubular steel with minimal upholstery and circular metal tables.

After World War II, restaurants diminished in popularity as more people ate at home. Many Londoners cherish fond memories of the Corner Houses and Tea Shops run by J. Lyons and Co. Corner Houses provided a taste of quasi-gentility to a drab post-war environment, with lavishly stocked confectionary shops leading into café-restaurants where Welsh rarebit and knickerbocker glories were served amid soft carpets, small tables with white cloths, panelled and mirrored walls and a string trio playing behind potted palms. In 1946 post-war building and decorating restrictions were still in force and to update their famous self-service Teashops, J. Lyons and Co. commissioned contemporary British artists such as L.S. Lowry, John Piper and Edward Bawden to produce a series of paintings which could appear as lithographs on the marble walls of their teashops in London and the provinces. These existed until the late 1960s.

The functional 1960s saw fresh emphasis on the psychology of restaurant design, providing a comfortable, contemporary ambience, particularly in the workplace. Fast-food snack bars in city centres acquired a new importance. In the Openpassage, Vienna, architect Franz Hoffmann provided a noise-absorbing acoustic ceiling suspended above the counters. Fifty fixed stools encircled a concrete core concealing the utility areas, while tables around the circular glass outer wall provided seating for 100. There was no ceiling light and each table had its own lamp.

Of the same period, the Silberkugel Restaurant, Zurich (Justus Dahinden with Peter Banholzer) was reached through a revolving glass entrance door set in a sheet metal sphere. A ceiling of eloxadized light metal contrasted with warm redwood sheathing, reflective mirrored supporting columns and black and white-jointed terrazzo flooring.

Foreign restaurants had begun to appear in London towards the end of the 19th century, run primarily by Italian, French and Chinese immigrants. This escalated in the 1960s with the introduction of cheaper air travel and package holidays. Ethnic does not have to mean bamboo pagodas. Witness London's Now and Zen restaurant with its strikingly modern

decor and running water sculpture between the three floors, and the Japanese Wagamama in Streatham Street, where speedy noodle dishes are served in an ambience of Minimalist soup kitchen. Fat Frank's, a Chinese restaurant in Sacramento, California, dating from the 1890s and designed by Anthony Machado, incorporated upholstery in purple, magenta, turquoise and midnight blue, with rose pink walls, gold paped ceilings and black granite table tops. Classic Indian architecture was used by Steven K. Peterson and Barbara Littenberg for the Indian Oven in New York City. Far from the red flock wallpaper school of Indian restaurants, this is restrained and classic, the only embellishment an occasional Indian antique statue or painting. A sequence of arches designed like entrances to an Indian mogul garden, leads into the restaurant; its dark, geometric trim on plain, pale walls echoed in the exterior.

In France, women had been eating in family restaurants since the 1770s. On the rue des Poulies, in 1765, M. Boulanger provided "restaurants", or restoratives, of soups and broth. The restaurant as such developed after the 1789 Revolution, when the aristocracy could no longer retain vast kitchens and extensive staff. Some of the legendary restaurants of Paris began around this time. Le Grand Véfour, 17 rue de Beaujolais, with its Directoire decor, opened in 1740 as the Café de Chartres.

The Belle Epoque saw the appearance of French cafés and bistros, with zinc-topped counters and iron-legged tables, decorated tiles and mirrors. Tea salons were furnished with sofas and large tables. The Art Nouveau back room of La Fermette Marbeuf (1900), 5 rue Marbeuf, has mosaics, tiles and cast-iron columns which were uncovered beneath formica walls during a later restoration. Lucas-Carton in the Place de la Madeleine is lined in wood panelling from the School of Majorelle, with seats in tobacco-coloured velvet; the Brasserie Lipp, St. Germain des Prés, has some stunning Belle Epoque ceramics. The Hotel Bristol's restaurant, rue du Faubourg St. Honoré, has some superb Regence woodwork. In contrast, Chartier's, the popular budget-priced eating place at 7 rue du Faubourg Montmartre, began as a turn-of-the-century soup kitchen and has remained much as it was, with communal tables and large mirrors.

In the 1980s, fashion designer Sonia Rykiel and designer Slavik were inspired by the great trans-Atlantic liners of the 1920s and 1930s in a retrospective design for Le Paris Restaurant in the Lutetia Hotel, St Germain des Prés, incorporating a combination of luxury woods, including lemon, wild cherry and walnut. On the walls wood panelling with inlaid *trompe-l'oeil* effects alternated with mirrors; Slavik's geometric chandelier illuminated a cream-coloured ceiling, geometric sconces, black velvet upholstery and black carpeting and orchids on the tables. Slavik was also responsible for the Jules Verne restaurant on the second platform of the Eiffel Tower, with its stark all-black decor and stunning view overlooking the Palais de Chaillot.

A London equivalent of the Parisian brasserie, Quaglino's, founded in 1929 in St. James's by a Piedmontese immigrant, and a glamorous Art Deco meeting place for the cocktail set, has been reborn in the 1990s. Designed by Sir Terence Conran with Keith Hobbs and Linzi Coppick, the new Quaglino's includes an intimate private dining room on the mezzanine

level, with a changing collection of contemporary paintings and a blind that can be raised, theatre box-like, to reveal a view of the restaurant.

An illuminated skylight runs the length of the main restaurant. Fittings are in solid timber, bronze, nickel, zinc and hand-forged steel; floors are marble, and ceramic tiles and mirrors throughout create a sense of space and unusual vistas. Sinuous curves permeate the design. Eight columns, 16 feet high on terrazzo bases, remain from the original ballroom on which the restaurant is built. Eight contemporary artists were chosen to paint each column in their own abstract style, focusing on the common theme of "pleasure". On the walls are a bas-relief monkey sculpture by Dhruva Mistry and black and white photographs of *Femmes Fatale de Nuit* by Noelle Hoeppe.

Bar chairs are cone-shaped, in bird's-eye maple with brightly-coloured leather seats; bar tables are topped with patinated spun zinc and stools have tubular steel frames. Philippe Starck was commissioned to design slender curving handles on the lavatory doors and the Q-shaped aluminium ashtrays are on sale as collectors' items.

A new trend in restaurants has emerged in the mid-1990s: the vast eating space capable of seating hundreds, such as Mezzo, Conran's ambitious restaurant at 100 Wardour Street, London. Designed by Conran and C.D. Partnership, and said to be the largest in Europe, it accommodates up to 700 people at any one time, on two levels. Mezzonine, seating 300, on the ground floor, is a luxurious fast-food restaurant specialising in the street food of Thailand, Malaysia and Japan. The decor is simple and uncluttered, with solid sycamore tables and aluminium chairs arranged in lines. The floor is "Crema Marfil" honed marble; the banquettes along the wall are upholstered in taupe and Helen Drew's specially commissioned black and white photographs featuring contemporary Soho, flank two walls.

The more traditional downstairs Mezzo, where the emphasis is on classic dishes served in a more leisurely atmosphere, is reached by a spiral staircase of stainless steel, bronze and marble. A dramatic double height space and wall of mirrors, refracted at different angles, is complemented by a wall of fire glass which descends between the two levels and divides both restaurants from the kitchens. The chefs perform for the diners, as if on stage.

Artist Allen Jones's paper-like sheet steel sculpture of a waiter with a girl tugging at his arm stands in the reception area, while in Mezzo vivid colour is provided by his series of screens depicting people dancing, playing musical instruments, drinking and talking, and a bas-relief of talking heads. The specially designed beech chairs are upholstered in blue moquette, with S-shaped banquettes centre-restaurant in deep burgundy and pink and aquamarine cushions on a group of round tables facing the kitchen and restaurant. Tables are zinc, chrome and laminate, with round tables covered in crisp white cloths.

Theme restaurants continue to spring up, such as Planet Hollywood with its films and stars theme; and Ed's Diner which recreates the ambience of the 1950s American diner. A 1940s roadhouse provides the theme for Knowlwoods, Santa Ana, California, designed by Becham / Eisenman. Customers pass through a simulated gas station with service bays inspired by outdoor food stands at a fairground. One of the two main

dining areas, The Elected Man's Canteen, contains a Wurlitzer jukebox; 1940s billboards; telephone poles, even G.I.'s jackets hanging from coat hooks.

The average life of a city restaurant is three years, and designers must continuously dream up new ways of tempting the public palate. Whether the future lies with the intimate dining room or cavernous restaurant, traditional or modern, interior design is a fundamental ingredient in an establishment's success or failure.

Retail and Shop Interiors

The interiors of shops have always been designed to entice customers inside and encourage them to buy. Shops have rarely been designed by famous designers or architects, but the design and display techniques of shops are nonetheless important and have played a significant role in the history of consumption. Shops have long been in existence and are even recorded in paintings of ancient Rome, revealing a simple stone counter used to display goods and for the exchange of money. By the medieval period shops had become more elaborate. They still tended to be small, formed of a single room with the counter set across the door or through an enlarged window, but efforts were made to make the shop appear decorative and enticing to the passing customer. Arches and mouldings were incorporated into the shops, and much was made of the colourful decorative and attractive properties of the goods on sale, goldsmiths placing their wares on specially made display boards, and textile merchants hanging up their cloth on hooks around the shop.

In these periods only the very wealthy could afford to patronise fine shops stocked with luxury goods, and most people made their purchases from the market stall, but over the centuries the number of shops steadily increased. By the second half of the 17th century the number of shops had reached significant proportions and in the 18th century shops took over as the retail outlet where most people made their

purchases. Now shops not only faced more competition but they also had to market themselves to different social groups. The visual evidence provided in surviving trade cards shows how 18th-century shops went to considerable lengths to offer decorative and fashionable interiors to impress their customers, and shopkeepers devised increasingly elaborate fittings to display their goods. Fortnum and Mason's of Piccadilly, or Harding and Howell who set up shop in the palatial accommodation of Schomberg House in Pall Mall, London, provide good examples of large-scale upmarket retailers whose shops reached department store scale at the end of the 18th century.

Other developments in retailing in the early 19th century, such as the bazaar and the covered arcade, also contributed, along with the large-scale shop, to the rise of the department store, which catered for the growing middle classes who had the time and money to travel from their suburban homes to town centres on the new omnibuses, trains and trams. By mid-century the department store had achieved the form recognizable today, selling many different types of goods under one roof and providing services for customers, including restaurants and cafés. The huge scale of department stores and their high profile in a town or city centre meant an emphasis on dramatic façades and interiors, reaching an apex towards the end of the century in both Europe and America. The use of cast iron as a building material allowed immense atria as entrance halls, grandiose sweeping staircases and balconies from which goods could make eye-catching displays. Here the seductive properties of interior design could be taken even further, ambience and atmosphere could be articulated more carefully and dramatically, and lighting, mirrors and space were employed in a more sophisticated way.

These techniques were employed by large specialist shops which also developed distinctive identities, for example Liberty and Heal's. While many large shops increasingly took their lead from American retail design, these shops depended on a traditional and nationalistic style appropriate to their own range of goods with their craft aesthetic.

In the early 20th century chain stores were developing, becoming a recurring feature in high streets and shopping malls as the century progressed. Their design was dependent on the creation of a strong corporate identity, established through colour, internal arrangement, lighting, display units and internal signage signalling convenience and consistency to the consumer.

The other key development of the 20th century was the self-service shop, of which the prime example is the supermarket, introduced from America to the world from the 1950s onwards. Here, design promoted an image of hygiene and efficiency, with a far greater emphasis on the customer's easy movement around the store and speedy payment. All the stock available was placed on display and the packaging of goods took on a greater relevance.

In retailing generally, the techniques of design and display and their impact on consumer psychology has undergone serious analysis in the 20th century. The height and size of display fittings, the consumer's view across the store and movements around it, the psychological impact of colour and the positioning of goods are assessed in an attempt to understand the buying process and to increase sales.

Retail and Shop Interiors: bakery department, Harrod's, London, c. 1925

Changes in traditions of service were also reflected in the rise of the boutique in the 1960s. Boutiques provided fashion-conscious teenagers with the fast-changing styles of the period, without the fussy politeness and attentive service of well-established shops. The design of boutiques was individualistic rather than expensive, with the emphasis on self-conscious styling, summed up by the approaches of Biba in fashion and Habitat in furniture. The bright, trendy look of the boutiques encouraged the diversification of images for shops and the age ranges targeted.

Today, retailing and shop design continue to diversify, but, as in the past, the retailer's design philosophy is also a marketing strategy. Shop design may reflect the progressive fashions of a period, or the styles or layout of other leisure environments such as cafes and restaurants, cinemas, hotels, or art galleries. It is chosen with the merchandise and intended clientele very much in mind, and is continuously adapting as society and demands change.

Réveillon

French wallpaper manufacturer; established before 1759

The name of Jean-Baptiste Réveillon (1725–1811) has long been synonymous with quality and excellence in wallpaper design. Active during the second half of the 18th century when wallpaper first became widely accepted as a fashionable form of decoration in France, the firm's work represented a uniquely successful combination of technical ingenuity and artistic skill and it was widely regarded as superior to that of all its rivals including the work of the celebrated Parisian paper-stainers Arthur & Grenard (later Arthur & Robert). And, although Réveillon is principally known today for its luxury goods – arabesque and Chinoiserie panels, pictorial designs and superbly drawn floral patterns – the firm also produced a large quantity of cheaper work and served a broad clientele that included both aristocrats and members of the court as well as wealthy members of the bourgeoisie.

Born in Paris in 1725, Jean-Baptiste Réveillon was apprenticed to a haberdasher-stationer from whom he learnt his trade. In 1753 he acquired his own haberdashery shop and specialised in the importing of English flock papers. The increasing popularity of these papers – Mme. de Pompadour decorated the walls of her closet at Versailles with “papiers d'Angleterre” – meant that this trade proved extremely lucrative but Réveillon's success was interrupted by the outbreak of the Seven Years' War (1756–63) which brought all trade with England to a halt. As a result, Réveillon began to manufacture his own versions of these papers, known as *tontisses à l'aigle*. In 1759 he established his business in the Faubourg Sainte Antoine where the paper-staining and luxury furnishings industries were concentrated. During the 1760s he purchased outbuildings and a large factory called the Folie-Titon. A large paper-making factory in Courtaignes (Ile de France) was added before 1775 and in 1776 he opened a shop opposite the gates of the Tuileries.

An energetic and imaginative entrepreneur, Réveillon was appointed Manufacture Royale on 15 July 1783 and was granted permission to “engrave, colour, print, paint, flock and sell wholesale or retail all sorts of paper, card, stuff, textile, leather or skin”. The artistic and technical expertise of his factory was brought to the attention of a vast audience when, through his contacts with the Montgolfier paper mill, a huge

balloon, 70 feet high and with 24 bands of Réveillon's wallpaper attached to the outer surface, was raised above the Folie-Titon and flown to Versailles in September 1783. These years marked the height of Réveillon's fame; numerous French and foreign dignitaries visited his workshops and, in recognition of his services to the wallpaper industry, he was awarded a gold medal for the Prix d'Industrie.

In 1789, Réveillon employed upwards of 300 workers and distributed wages amounting to 200,000 livres, which made the firm one of the largest businesses in the capital. But on 27 and 28 April 1789 the factory was looted by staff and members of the Paris mob in response to a rumour that Réveillon was planning to cut wages. The ferocity with which this uprising was suppressed resulted in more than a hundred deaths during the rioting itself and numerous others were sentenced to death afterwards. With the exception of 10 August 1792, it was the bloodiest day of the French Revolution and it represented the first direct involvement of the people of Paris in their stand against employers and the government.

For Réveillon himself the consequences of the uprising were less catastrophic. In order to escape the rioting he took refuge in the Bastille until the beginning of July and there is no evidence to corroborate the suggestion that he went into temporary exile in England. His business recovered quickly and was functioning again by the autumn of 1789; even the losses suffered by the factory were slight. Nevertheless, he rented the factory to the wallpaper manufacturers Jacquemart & Bénard from May 1791 and the property was sold to them a year later in May 1792. Whether his retirement was due to his increasing age or to the effects of the rioting is not known but the proceeds of the sale meant that Réveillon was able to live out the remainder of his life until his death in 1811 as a wealthy man. Jacquemart & Bénard continued to produce high quality wallpaper under all the subsequent regimes before closing their doors in 1840.

Fortunately much of Réveillon's work and that of his successors survives. The so-called “Billot” albums are particularly important and contain small samples representing almost the entire output of the two firms for the period 1770 to 1838. These samples reveal Réveillon's work to have been extremely varied, ranging from flocks to arabesque panels and from floral patterns to panoramic designs. The early years were dominated by flock papers similar in style to English examples but with a greater emphasis upon damask patterns. During the 1780s, the firm concentrated on papers that imitated Lyon silk designs. During the years 1780 to 1800 production was characterised by copies of Indian cottons, naturalistic floral patterns, sumptuous Neo-Classical designs, and also simple patterns printed in two and three colours. But perhaps the most celebrated of the company's products were the striking arabesque papers – introduced from c.1788 – that imitated the ancient Roman wallpaintings discovered in excavations at Herculaneum and Pompeii. Produced in the form of panels approximately eight to ten feet high, with matching or complementary borders, these papers featured arabesque and grotesque ornament, floral garlands, bouquets, birds, beasts and insects, and often incorporated plaques, roundels and other architectural devices. They were a cheaper alternative to the painted decorations fashionable in many of the larger hôtels and châteaux and the fact that they were easily inte-

Réveillon: wallpaper with arabesques, c.1780

grated with other architectural and decorative features made them quite popular with wealthy clients. Even so, they were always luxury items, and represented the firm's technical and artistic *tours de force*. Similar designs were also produced by other companies, and a more genuinely original product was Réveillon's imitations of hand-painted Chinese wallpapers that employed westernised motifs. Little new work appears to have been produced by Jacquemart & Bénard after 1800 although they did carry out some official orders for public buildings including decorations for the coronation of Charles X, and a number of panoramic papers including the *Chasses de Compiègne* (1812).

Several of Réveillon's Chinoiserie papers were in the style of Jean Pillement and certain of the arabesque designs resemble the work of Jean-Baptiste Fay but unfortunately little is known of his draughtsmen. He himself mentions "a very distinguished artist [who] would like to join my factory" and several other painters and designers but without ever giving their names.

The technical and artistic virtuosity of Réveillon's work was unparalleled by previous manufacturers and suggested new standards to which wallpaper could aspire. Building on foundations established by English manufacturers, his work rapidly outstripped that of his English counterparts and sowed the seeds for the supremacy of the French wallpaper industry that would last until the end of the 19th century. Today, Réveillon's papers are widely sought after as collectors' items in Europe and the United States.

BERNARD JACQUÉ

Selected Works

Wallpapers by Réveillon and Jacquemart & Bénard are represented in all the major collections, but the most coherent groups are in the Follot collection in the Musée des Arts Décoratifs, Paris, and in the Musée du Papier Peint, Rixheim. Additional examples representing copyrighted designs spanning 1794–1802 are in the Bibliothèque Nationale, Paris. Examples of Réveillon's work survive *in situ* at the Gut Schmidt, Guntersblum, Germany, at Moccas Court, Herefordshire, England, and in a house in Suffield, Connecticut.

Further Reading

There is no catalogue raisonné of Réveillon's work but general descriptions appear in most surveys of wallpaper; the relevant chapters in Clouzot and Follot 1935 are among the most reliable and helpful. For a detailed study of the firm's arabesque designs see Jacqué 1995.

Richardson, H.H. 1838–1886

American architect, interior and furniture designer

A connoisseur of fine foods and wines, Henry Hobson Richardson was a man who enjoyed life on a grand scale and is best known as the creator of the Richardsonian Romanesque

Style of architecture. His use of boulders, monumental rounded arches and careful attention to fenestration propelled him into prominence as an architect. Richardson, however, did not neglect interiors. From his collaboration with John La Farge, on the interior of Trinity Church, Boston, to his oak paneled interiors for the Glessner House, Chicago, he lavished care on the design of interiors. This concern included large features such as fireplaces (New York State Capitol, Court of Appeals, 1881), to gaslight sconces (Billings Memorial Library, 1883–86). Additionally, Richardson and his staff introduced many clients to the works of Morris and Company and other Arts and Crafts designers in an attempt to improve the quality of American interiors.

As one of two Paris-educated architects in the United States (Richard Morris Hunt was the other), Richardson was in a unique position to influence American architecture and design. After graduating from Harvard, where he had become a member of the prestigious Porcellian Club, Richardson traveled to Paris in 1859. In November 1860, he passed the entrance examinations for the *Ecole des Beaux-Arts* and entered the atelier of Jules André. Although Richardson was unable to complete his course of study at the *Ecole des Beaux-Arts*, because of financial difficulties brought on by the Civil War, he received a thorough grounding in designing for large-scale projects that would serve him well upon his return to the United States.

Richardson's early work reflects both European influences and the influences of other British and American architects imitating French styles, as for example in his design for the Western Railway Offices, Springfield, Massachusetts (1867–69). Another commission in Springfield, the Church of the Unity (1866–69), gave Richardson the opportunity to work with an ecclesiastical interior. The Church of the Unity is designed in a restrained Gothic style. At the center of the east end a raised platform with a pulpit is linked by stairs leading up to the choir and organ lofts flanking the pulpit. Organ pipes, high above the pulpit, draw attention upward to the coffered, wooden ceiling, supported by corbels, braces, hammerbeams and arched braces. This successful design led to additional church commissions including Grace Church, Medford, Massachusetts (1867–69) and Brattle Square Church, Boston (1870–72). Richardson's most impressive church interior, Trinity Church, Boston (1872–77), influenced by the Romanesque architecture of Spain and southern France, is dominated by a large tower at the crossing and round arches. Trinity Church's cruciform, barrel-vaulted interior focuses attention on the choir area, which is itself dominated by tall, round-arched, stained-glass windows. His desire for a rich interior was accomplished in cooperation with John La Farge, who was responsible for painted figurative murals and decorative panels, as well as the designs for stained-glass windows (e.g., those of the west end). Richardson's contract included designs for furniture and other interior features, such as the "corona" (since destroyed), an elaborate metalwork chandelier suspended above the crossing. The success of Trinity Church was a significant step for Richardson and his career.

In 1874, while Trinity Church was in progress, Richardson moved from Staten Island to Brookline, near Boston, a move that led to additional commissions in Massachusetts. From the mid-1870s until his death in 1886, Richardson was responsible

for numerous large-scale projects, including the Winn Memorial Library, Woburn, Massachusetts (1876–79), Sever Hall, Harvard University (1878–80), City Hall, Albany, New York (1880–82), Austin Hall, Harvard University (1880–84), and the Allegheny County Courthouse, Pittsburgh (1883–88). For the long basilica-like stack wing of the Winn Memorial Library, Richardson designed a wooden barrel-vaulted ceiling. These stacks, with customized metal railings around the upper-tier balconies, are separated from the central nave-like hall by arcades of rounded arches on both sides. The more austere Reading Room has a flat, wood beam ceiling and large expanses of wall above bookcases that take the place of a dado.

In 1876, Richardson was commissioned to work on designs for the Senate wing of the New York State Capitol Building, while Leopold Eidlitz designed the House wing. Richardson's designs included interiors for the Senate Chamber, the New York State Court of Appeals and the governor's chamber. Richardson's interiors differed from those of his contemporaries by stressing straightforward, uncomplicated paneling for walls and coffered ceilings, rounded arches and massive, but essentially comfortable furniture. Ornamentation was restrained, with the exception of fireplaces which, as for the New York Court of Appeals, were surrounded by decorative panels of relief sculpture dominated by Arts and Crafts-style vegetal exuberance. An immense (154-inch tall) tower clock, placed to the right of the fireplace, was an exercise in surface variety. Surviving sketches of furniture and furnishings for Richardson's interiors include andirons for Austin Hall, an annular settee for the Billings Memorial Library and a chair for the Converse Memorial Library.

Richardson and his staff had a significant impact on the design of domestic interiors. Richardson's interiors were designed to meet the needs of wealthy clients as in the case of the Watts Sherman House, Newport (1874–75); the Paine House, Waltham (1884–86) and the Glessner House, Chicago (1885–87). Richardson left most of the interior design for the Sherman House to Stanford White, his assistant. The interior spaces, with their asymmetrical arrangement, were Richardson's, while the details, which resemble White's later work with McKim, Mead and White, were left to White, under Richardson's overall supervision. The large dining room fireplace with inglenook, was a feature common to Richardson's interiors, as was the chimney breast in the large hall. Another important Richardsonian feature was the main staircase, as in the Paine House. This dramatic *tour de force* combines windows, balusters, paneling, built-in settees and chandelier. For the Glessner house Richardson designed a formal interior for the public spaces dominated by large fireplaces, oak paneling and dramatic staircases. Morris furniture, carpets, wallpapers and fabrics were used throughout. Tiles by William De Morgan were incorporated into the design of the bedroom fireplaces. The Glessners, under the tutelage of Richardson and his staff, added works by Daum Frères, Tiffany and Émile Gallé. The Glessner House reflects the features of many Richardsonian interiors, with its uncluttered but formal spaces accented by dramatic staircases, large, richly appointed fireplaces and restrained use of ornamentation.

Biography

Henry Hobson Richardson. Born in St. James Parish, Louisiana, 29 September 1838. Educated at Harvard College, Cambridge, Massachusetts, 1856–59; enrolled in the atelier of Jules André, Ecole des Beaux-Arts, Paris, 1860. Married Julia Hayden, 1867: 5 children. Draughtsman in the office of Théodore Labrouste, Paris; employed by the architect Jacques Ignace Hittorff (1792–1867). Settled in New York, 1866; worked in architectural partnership with Emlyn Littel, 1866–67; partner with Charles D. Gambrill (1832–80), New York, 1867–78. Moved to Brookline, near Boston, 1874; subsequently in independent practice in Brookline and New York. Designed furniture from 1866. Fellow, American Institute of Architects; member, Society of Arts and Sciences; member, Archeological Institute of America. Died in Brookline, 27 April 1886.

Selected Works

A large collection of architectural drawings and manuscripts relating to Richardson's work is in the Houghton Library, Harvard University. Richardson's library and a collection of photographs is in the Loeb Library, Harvard Graduate School of Design. Examples of his furniture are in the Museum of Fine Arts, Boston.

Interiors

- 1872–77 Trinity Church, Boston, Massachusetts (building, interiors and furniture; decoration by John La Farge)
- 1874–75 Watts Sherman House, Newport, Rhode Island (building and interiors; with Stanford White and John La Farge)
- 1876–81 New York State Capitol, Albany (Senate Wing building, interiors and furniture)
- 1876–79 Winn Memorial Public Library, Woburn, Massachusetts (building, interiors and furniture)
- 1880–84 Austin Hall, Harvard University (building and interiors)
- 1883–86 Billings Memorial Library, University of Vermont, Burlington (building and interiors)
- 1883–88 Allegheny County Courthouse and Jail, Pittsburgh (building and interiors)
- 1884–86 Paine House, Waltham, Massachusetts (building and interiors)
- 1885–87 Glessner House, Chicago (building, interiors and some furniture; completed by Charles Allerton Coolidge)

Riemerschmid, Richard 1868–1957

German architect and designer

Richard Riemerschmid was among the most important German designers of the 20th century, and he made a significant contribution to the Functionalist movement. As Hermann Muthesius suggested in an article in *Die Kunst* in 1904, Riemerschmid's prime concern was "the inherent development of form out of function". Riemerschmid was equally content to design objects for production by hand or machine, and the manufacture of much of his output combined both methods. He was an influential teacher, and he was instrumental in organising the design profession in Germany.

Riemerschmid studied painting at the Munich Academy from 1888 to 1890 and embarked on a successful career as an artist. In 1895 he married the actress Ida Hoffmann, and for the couple's new apartment in the Hildergardstrasse, Munich, Riemerschmid designed some furniture, his first attempt in this field. Based on examples of Gothic furniture in the Bavarian National Museum, these ornate pieces bore little relation to Riemerschmid's subsequent work, except in the simplicity of their construction and the cheapness of their materials.

Although continuing as a painter, Riemerschmid proved susceptible to the feeling shared by many young Munich artists, that current social conditions demanded some form of commitment to the applied arts. At an international art show held in 1897 at Munich's Glaspalast, Riemerschmid showed not only paintings but furniture and stained glass. The furniture designs were highly original with ornament reduced to shallow carving and metal fittings which reflected *Jugendstil* preoccupation with natural forms. After the exhibition, Riemerschmid was among the artists who established the Vereinigte Werkstätten für Kunst im Handwerk (VWKH; United Workshops for Art in the Handicrafts), and over the next two or three years he designed a wide range of furniture and metalwork for this organization. Candlesticks and lamps in brass, bronze or copper, and a silver cutlery service, were

Riemerschmid: Trarbach restaurant, Berlin, 1904–05

conceived in simple, organic shapes which exploit the character of the material but remain severely functional.

Between 1898 and 1900, Riemerschmid designed the furniture and fittings for rooms in the houses of friends and colleagues. For Hermann Obrist, a fellow designer and member of the VWKH, he designed a bedroom and boudoir; for K. Thieme he provided a drawing room, library and living room, and for the painter W. Otto's house in Bremen another living room. The work was executed by the VWKH or B. Kohlbecker & Sohn, one of the leading Munich cabinet-makers. These clients were all well-to-do intellectuals, aware of the latest aesthetic trends, and, similarly, a music room designed by Riemerschmid and exhibited at Dresden in 1899 catered for a refined, modern sensibility. This aspect of Riemerschmid's work was crowned by his contribution to the

Paris Universal Exhibition of 1900, where he showed another complete interior, a Room for an Art Lover, for which he was awarded a gold medal. This room incorporated furniture, carpet, wallpaper, carved wooden panelling, a stucco frieze and a mural painting; the whole ensemble was unified by a thematic programme of motifs representing water and plant forms.

A new direction in Riemerschmid's work was indicated by a side-chair which had been included in the music room shown at Dresden in 1899. In this design, sinuously curved side struts connect the front feet to the top of the back legs where they meet the back-rest, so giving the chair great strength and stability without the need for bulky legs or stretchers. The resulting economy of materials and elegance of design prompted a contemporary critic, Paul Schulze-Naumburg writing in

Dekorative Kunst in 1899, to praise Riemerschmid for his "original ideas of construction which ... become lines of decoration". Slightly altered versions of this chair were produced under licence by Liberty's for many years. Riemerschmid again demonstrated his concern for economy of materials and cheapness of manufacture when, the following year, he won a competition organized by the Bavarian government for a suite of living room furniture costing less than 350 marks to produce.

Riemerschmid's growing reputation as a designer brought him commissions to create ranges of glassware, silver and porcelain, at the same time drastically curtailing his activities as a painter. In the opening years of the 20th century he worked on a number of interior design schemes for private patrons, and some furniture designed by him was exhibited by the prestigious Wertheim department store in Berlin. But he continued to strive towards low-cost, mass-produced furniture, now in association with his brother-in-law, the cabinet-maker Karl Schmidt (1873–1948) who ran the Dresdener Werkstätten. Furniture designed by Riemerschmid and made by the Workshops was exhibited in 1903. It was not radically different to his earlier work, but in 1906, at the III. Deutsche Kunstgewerbe-Ausstellung (3rd Exhibition of German Applied Art), held in Dresden, the Workshop introduced their *Maschinenmöbel* (machine furniture), designed by Riemerschmid. This simple, compact furniture was made of cheap timber stained red, blue or green, and its box-like construction allowed the use of labour-saving machinery in its manufacture; most pieces could be easily dismantled and laid flat, reducing transport and storage costs. Hinges, lock-plates and handles were made of iron or brass, and decoration was restricted to small, stencilled motifs. The aesthetic appeal of the furniture depended largely on shape, line and proportion.

The cheapness and compactness of the machine furniture was achieved partly through lessons learned in the design of furniture for the cabins and wardrooms of several German warships. These commissions had been won for the Dresden Workshops by Schmidt, and were in progress from 1902.

Alongside the furniture, the Dresden Workshops exhibited in 1906 a wide range of *Kleingerat* (household equipment) including metalwork, stoneware and textiles designed by Riemerschmid. Brass hanging- and table-lamps were composed of simple shapes, and prominent screw-heads achieved the same decorative effect as did exposed peg-ends on the furniture. Stoneware jugs and tankards, generally in spherical or ovoid shapes, bore restrained moulded and coloured decoration of small leaves and spiral lines, echoing the motifs used on the printed furnishing fabrics which were produced on Jacquard looms in linen, cotton or silk.

Both the promotional literature issued by the Dresden Workshops and reviews of the exhibition in contemporary art periodicals praised the plainness and simplicity of the furniture and utensils, and emphasised the artistry of the designs and the use of sophisticated machinery in their production, thus making beautiful objects available to a wider public. Paul Schumann, writing in *Kunstgewerbeblatt* in 1906, dubbed Riemerschmid's machine-furniture "an artistic and an ethical deed".

In 1908, Riemerschmid exhibited furniture of a more luxurious nature at Die Ausstellung München (The Munich

Exhibition), a show that so impressed a delegation from the French Union Provinciale des Arts Décoratifs (Provincial Union of the Decorative Arts) that a group of Munich designers, including Riemerschmid, was invited to exhibit 18 interiors at the 1910 Salon d'Automne in Paris. Riemerschmid contributed a *Damenzimmer* (boudoir) in a refined version of the revived Biedermeier style then popular in Germany, and his furniture, wallpaper, carpet and accessories were as well coordinated as the interiors presented by the other Munich designers. The *ensemble* concept introduced to the French designers by this exhibition had a profound effect on the evolution of Art Deco in France.

Riemerschmid continued to design furniture and household goods over the next three decades, but an increasing amount of his time was spent on architecture, teaching and professional organization. He was largely responsible for the planning and design during 1907–13 of Germany's first garden city at Hellerau, near Dresden, which was built for the employees of the Deutsche Werkstätten (German Workshops, as the Dresden Workshops had been re-named). He was director of the Kunstgewerbeschule, Munich, from 1913 to 1924 and head of the Cologne Werkschule 1926–31. During 1921–26 he was chairman of the Deutscher Werkbund of which he had been a member since its foundation in 1907.

MALCOLM HASLAM

Biography

Born in Munich, 20 June 1868, the son of a textile manufacturer. Studied painting at the Munich Academy, 1888–90. Married the actress Ida Hoffmann, 1895; four children. Active as a painter, Munich, 1890–c.1900; active as a designer of furnishings, from 1895; practised as an architect, from c.1897. Co-founder, with Hermann Obrist, Bruno Paul, Bernhard Pankok, and Peter Behrens, Münchner Vereinigte Werkstätten für Kunst im Handwerk, Munich, 1897; founder-member, Deutscher Werkbund, 1907, Chairman, 1921–26. Taught at the Munich School of Art, 1902–05, and at the Berlin Kunstgewerbemuseum, 1907. Director, Kunstgewerbeschule, Munich, 1913–24; Director, Werkschule, Cologne, 1926–31. Exhibited at several national and international exhibitions including Dresden 1899, Paris 1900, St. Louis 1904, and Brussels 1910. Awarded a Gold Medal, Paris 1900. Died in Munich, 13 April 1957.

Selected Works

A substantial collection of Riemerschmid's furniture is in the Stadtmuseum, Munich. Examples of his designs and drawings are in the Architektursammlung der Technischen Universität, Munich.

Interiors

- 1896 Riemerschmid House, Pasing (building, interiors and furnishings)
- 1898 Thieme House, Munich (drawing room and library; dining room 1903; music room and study 1905–06)
- 1899 Villa Obrist, Munich (boudoir and bedroom)
- 1899 Deutscher Kunstausstellung, Dresden (Music Room)
- 1900 Exposition Universelle, Paris (Room for an Art Lover)
- 1901–02 Schauspielhaus, Munich (interior decoration)
- 1903 Dresdner Werkstätten Exhibition, Dresden (9 rooms including furnishings)
- 1904–05 Trarbach restaurant, Berlin (interiors including furnishings)
- 1904–06 *Kronprinzessin Cecilie* steamship (Kaiser Suite)
- 1905–06 Sultan House, Berlin (building, interiors and furnishings)
- 1905–13 Weiland House, Ulm (building, interiors and furnishings)

- 1906 Third Deutsche Kunstgewerbe-Ausstellung, Dresden (17 rooms and furnishings)
 1910 World's Fair, Brussels (3 rooms including furnishings)

Riemerschmid's designs for furniture were manufactured by Wenzel Till, and B. Kohlbecker & Sohne, and the Münchner Vereinigte Werkstätten für Kunst im Handwerk, Munich; Dresdner Werkstätten, and Theodor Reimann, Dresden; and J. Fleischauer's Sohne, Nuremberg. His designs for textiles were woven at the Dresdner Werkstätten. Designs for ceramics were made by Villeroy & Boch, Mettlach, Reinhold Merkelbach, Grenzhäusen, Königlich-Sächsische Porzellan-Manufaktur, Meissen, and Grossherzogliche Majolika Manufaktur, Karlsruhe. Riemerschmid's designs for table glass were made by Benedikt von Poschinger, Oberzweiselau, and his stained glass was made by Carl Ule, Munich. His brass vessels were made by Konrad König, Munich, his designs for silverware were executed by Peter Bruckmann & Sohne, Heilbronn, and Carl Weishaupt, Munich; candlesticks, lamps and silver cutlery were made by the VWKH, and brass lamps were made by the Dresdner Werkstätten.

Rietveld, Gerrit 1888–1964

Dutch architect and designer of furniture and interiors

Gerrit Rietveld was trained as a cabinet-maker, and was largely self-taught as an architect, but it is as a designer of experimental furniture that he is best known today. His earliest furniture designs, dating from the second decade of the 20th century, reveal influences from several sources, namely the work of H. P. Berlage, the Glasgow School, the Wiener Werkstätte and Frank Lloyd Wright. They are characterised by a severe linear form and transparent structure, and the styling is based on the concept of the continuity and unity of space. His most radical piece – the *Red Blue Chair* (designed c.1918 and probably not painted until 1923) – became closely identified with the De Stijl group with whom Rietveld was associated from 1919. Rietveld continued to design and make furniture throughout the remainder of his career and other innovative pieces include the

one-piece fibre *Birza* chair (1927), his *Crate* furniture (1934) and the aluminium armchair (1942). From 1920 he expanded his range of activities to encompass architecture and interior design, and many of his interiors featured examples of his furnishings. Rietveld received a wide variety of commissions for interiors – ranging from shops and domestic houses to trade fairs, exhibitions and museums – and this work constituted a large and significant part of his oeuvre.

Rietveld was an interior architect in the truest sense of the term. Because he saw space as the essence of architecture, he believed that the interior should be designed in such a way that every facet would help to optimise the experience of space. Thus designs for existing buildings almost always required architectural modifications. Harmonious proportions, natural light or the use of artificial light were viewed as vitally important, and furnishings were reduced to the bare necessities, which in Rietveld's opinion were very few. Colour was also highly significant. Partly inspired by the De Stijl artists who advocated the use of primary colours within interiors and architecture, Rietveld applied flat, geometric areas of colour to walls, ceilings and floors. He also adopted their emphasis upon primary colours although, unlike most other De Stijl designers he never totally excluded the use of other hues.

Rietveld's first important interior was part of a project to renovate the jewellery shop Goud- en Zilversmidcompagnie (GZC) in Amsterdam (1921). He transformed the long narrow space into a serene interior by designing various pieces of stylistically unified and harmoniously proportioned furniture and by applying areas of white, black and grey to the walls, ceiling and floor. The carpet was purple. The areas of colour were arranged so that they matched each other and so that they echoed the lines of the floor covering and display cases.

In 1924 Rietveld designed his best-known work – the canonical Schröder House in Utrecht. The house and its interiors were designed in close consultation with his client Truus Schröder-Schräder, and the project marked the beginning of a collaborative relationship that lasted until the end of Rietveld's life. One of the most striking features of the Rietveld Schröder interiors is the use of colour, and areas of red, yellow, blue, white, black and grey paint form a vivid background to life in the house. Also, in keeping with the vision of De Stijl, proportion, form, composition and colour are harmoniously interwoven down to the smallest details in a three-dimensional setting. However, the interior of the Rietveld Schröder house was more than an artistic manifesto. In it Rietveld was trying to give new content to the concept of living. In his opinion, traditional houses encouraged a passive view of life. The Rietveld Schröder house was designed in such a way that one could not help but be aware of every action, whether it was taking a bath, sleeping or eating. Each activity required an effort; the bathing area and the bedroom, for example, had to be created by shifting walls, making up the sofa bed, and erecting the folding table. The size of the interiors was determined by the amount of time spent in different rooms. Less-used areas were combined, resulting in a dining room / kitchen, and a hall / stairwell. While some of the furniture was built-in, the free-standing pieces were flexible and mobile. The first floor of the house is conceived as a multi-functional space. By using sliding partitions it can be divided into separate bedroom / living rooms that varied in number from one to four. And the flexi-

bility of the house was shown in 1936 when the ground floor was let and Truus Schröder occupied the first floor. Various features were introduced to provide a visual link between the interior spaces and those around the house. Uplighting was fitted in the fixed walls and above the doors; and large horizontal areas of glass, outside doors in every room, a lamp on the roof, balconies and louvres helped to achieve a fluid transition from interior to exterior space.

In 1926 Rietveld collaborated with Truus Schröder on the conversion of the Amsterdam house belonging to Rein Harrenstein and An Harrenstein-Schröder, Schröder's sister. They created a completely new space in the bedroom with the aid of partitions, panels, mirrors, and a new suspended ceiling section behind which the lighting was hidden. The Harrensteins' living room was also remodelled and was furnished with a sofa bed and cooking facilities so that it could function as a separate living space.

At the end of the 1920s Rietveld's interiors became more restrained in their colour, style and detailing and reveal the influence of Modernist architecture. In 1931 Rietveld and Schröder designed a model home in one of the four terraced houses which he had built opposite the Rietveld Schröder house. The interior was light and the walls were painted white or pastel shades of purple, green and grey. The rooms were furnished with Rietveld's tubular steel furniture. A striking feature was that the furniture was produced in standard dimensions which could be assembled by the customer into desks, bookshelves and wall cabinets.

During the 1950s Rietveld continued to occupy himself with interior design, but in contrast to his work of the pre-war period, he no longer strove above all for artistic unity or used extreme colours in his interiors. Rather the strength of his designs was manifested in the carefully chosen combination of light, pure spatial relationships and a harmonious balance of different materials. But, influenced by the renewal of interest in the work of the De Stijl group in the 1950s, Rietveld still drew inspiration from its colour idiom in commissions where this was appropriate. An example of this trend is the design of the press room for the Unesco building in Paris (1958). The press room was in the basement where there was not only no daylight but the space was also irregular and the longest wall ended in a curve. Rietveld used areas of bright colours and lines based on a ground-plan of 241.5 cm by 241.5 cm as the basis of his interior design. This unified system of proportions and colours was carried through on different levels. And the two dominant materials – linoleum and suede – were used not only for the floor and walls but also for the table tops and chair coverings.

Another commission from this period was the design of colour schemes for aircraft interiors for the F.27 Friendship, the Lockheed Electras and the Douglas DC-7C and DC-8C. For these narrow oblong interiors Rietveld tried to achieve a pleasant spatial experience through the interplay of lines and colours. Unfortunately, although a prototype of Rietveld's design was built, his ideas were not put into commercial production. Rietveld's post-war interiors, in which colours play a less dominant role, are conceived as a unity of space and light.

Biography

Gerrit Thomas Rietveld. Born in Utrecht, 24 June 1888, the son of a cabinet-maker. Attended evening classes in painting at the Municipal Evening School, Utrecht, 1904–08; studied architectural drawing with P. Houtzagers, Utrecht, 1908–11; studied architecture with P.J. Klaarhamer, Utrecht, 1911–15. Married Vrouwgjen Hadders, 1911 (died 1958). Apprentice in his father's carpentry and cabinet-making business, 1899–1906; draughtsman, C.J. Beeger's jewellery studio, Utrecht, 1906–11. In private practice as a cabinet-maker, Utrecht, 1911–19, and as an architect, Utrecht, 1919–60. Collaborated on architecture and interior projects with Mrs. Truus Schröder-Schröder, 1921–64; partner, with J. van Dillen and J. van Tricht, 1960–64. Numerous designs for Modernist furniture and interiors from the 1920s. Instructor in Industrial and Architectural Design, Academie voor Beeldende Kunsten, Rotterdam and The Hague, Academie van Beeldende Kunst en Kunstnijverheids, Arnhem, Netherlands, and Academie voor Baukunst, Amsterdam, 1942–58. Exhibited at numerous national and international shows including the Werkbund Exhibition, Cologne, 1931, and the Vienna Biennale, 1931. Member, De Stijl Group, 1919–31. Founder-member CIAM (Congrès Internationaux Architecture Moderne), 1928. Died in the Schröder House, Utrecht, 25 June 1964.

Selected Works

The most important archive collections relating to Rietveld's work are the Rietveld Archive in the Nederlands Architectuurinstituut, Amsterdam, and the Rietveld-Schröder Archive in the Centraal Museum, Utrecht. The largest collections of Rietveld furniture are in the Centraal Museum, Utrecht, and in the Stedelijk Museum, Amsterdam.

Interiors

- 1920–22 GZC Jeweller's Shop, Kalverstraat, Amsterdam (interiors and furniture)
- 1920–22 Dr. Hartog's Surgery, Maarssen (interiors and furniture)
- 1923 Exhibition Room, Greater Berlin Art Exhibition, Berlin (interiors and furniture; with Vilmos Huszár)
- 1923–25 Schröder House, Prinz Hendriklaan 50, Utrecht (building, interiors and furniture)
- 1925–26 Dr. Harrenstein House, Amsterdam (interiors and furniture; with T. Schröder)
- 1927 Tesselschadestraat 4, Amsterdam (remodelling of interior and furniture; with T. Schröder); Birza family
- 1927–28 Garage and Chauffeur's quarters, Waldeck Pyrmontkade, Utrecht (building and interiors)
- 1928 Zaudy Shop, Wesel, Germany (building and interiors)
- 1930 Deutsche Werkbund Exhibition, Cologne
- 1930–31 Row Houses, Erasmuslaan 5–11, Utrecht (buildings, furnishings and interiors; with T. Schröder)
- 1933 Metz & Co., Leidschestrade, Amsterdam (showroom interiors and furniture)
- 1934 Row Houses, Erasmuslaan and Prinz Hendriklaan, Utrecht (building, interiors and some furniture; with T. Schröder)
- 1936 Mees House, Van Ouwenlaan 42, The Hague (building and interiors)
- 1936 Cinema, Vreeburg, Uredenburg, Utrecht (building, interiors and furniture)
- 1939 Murk Lels House, Maarsbergseweg 3, Doorn (building and interiors)
- 1941 Summer House, Breukelerveen (building, interiors and furniture); Mrs. Verrijn-Stuart
- 1951 Stoop House, Beekhuizenseweg, Velp (building, interiors and furniture)
- 1954 Priezen Tile Agency, Arnhem (showroom interiors)
- 1957 Cordemeyer House, Montanaban 8, Apeldoorn (building and interiors)

- 1957 Rijks Academie van Beelende Kunsten, Amsterdam (remodelling of interiors)
- 1963–72 Rijksmuseum Vincent Van Gogh, Amsterdam (building and interiors; completed by J. van Dillen and J. van Tricht)
- 1964 Hoecksteen Church, Vithoorn (building also housing a bank, kindergarden, theatre and gym, interiors and furniture)

Rietveld began designing furniture soon after his first contact with the De Stijl group in 1917. His most celebrated pieces include his *Red Blue* chair c.1923 (monochrome prototype 1918), his *Berlin* chair and *End* table 1923, his *Zig-Zag* chair 1932, and his *Crate* series 1934. Most of his designs were produced by his assistant, Gerard van de Groenekan, and sold by the Amsterdam department store Metz and Co. The rights to Rietveld's furniture were acquired by Cassina, Milan after his death; they continue to reproduce and sell "classic" examples of his work.

Rinaldi, Antonio c.1710–1794

Italian architect

The Italian architect Antonio Rinaldi worked in Russia for more than 30 years (1752–1784) during a period which marked his own creative flowering and in which he made a significant contribution to the development of Russian architecture and landscape. He designed palaces, churches, theatres and pavilions, but it was in the field of interior design that his talent stood out most clearly. He was a skilful artist, a fine colourist and a virtuoso designer, combining an inexhaustible fantasy with refined taste and the command of a wide range of different materials and techniques.

Rinaldi's art underwent a complex evolution from the forms of late Italian Baroque which characterized his early (1740–45) independent works in Italy under the direct influence of his tutor Luigi Vanvitelli to the interiors of the 1770s and 1780s where the decoration embodied the principles of classicism. However, Rinaldi's name is most often associated with the creation of the purest forms of Rococo.

Invited to Russia by Count Kirill Razumovsky, Rinaldi was appointed court architect to the heir to the Russian throne, the Grand Duke Peter Federovich and his wife, the future Emperor Peter III and the Empress Catherine II. He worked on a considerable number of projects at Oranienbaum, the future Imperial residence outside St. Petersburg, for many years (1756–74) and secured the permanent patronage of Catherine II.

Rinaldi's buildings at Oranienbaum – Peter III's palace, the Chinese Palace and the pavilion at Katalnaya Gorka – all demonstrate the stylistic diversity of the 1760s. Behind the simple and restrained façades, which united Baroque motifs and the methods of early classicism, interiors opened up which were striking in their beauty and elegance and where the delicate forms of Rococo and Chinese exoticism predominated.

The palace for Peter III (1759–62) is the earliest of Rinaldi's surviving buildings in Russia. The palace itself is a modest and intimate villa on the outskirts of the city with a compact square-shaped plan. The organisation of the building's internal space is subordinate to the demands of domestic comfort.

Lacquered paintings by the Russian artist F. Vlasov, which followed ancient Chinese traditions, were included in the elegant Rococo decor, which managed to retain Rinaldi's original artistic intent despite frequent changes. Additional fantasies on a Chinese theme on the wall panels and around the doors and windows depicted domestic and architectural scenes, and scenes from nature. Their style matched that of the wall tapestries, the low relief stucco moulding on the ceilings and fireplaces in white with touches of gilt and silver, and the ornamental drawings on the parquet floors.

A passion for "Chinese" compositions – Chinoiserie – in the mid 18th century developed under the influence of German Rococo and was determined to a considerable degree by the personal tastes of Peter III and Catherine II. In the main state rooms of the Chinese Palace (1762–69) exotic oriental motifs – stylized wall panels, carvings, paintings, stucco moulding and genuine Chinese lacquered furniture and china – were used to decorate the large and small studies, and the Glass Room (*stekliarusny kabinet*), as well as sounding original notes in the decor of other rooms.

Rinaldi: Porcelain Study, Sledding Hill Pavilion, Oranienbaum (now Lomonosov), near St. Petersburg, 1762–74

The Chinese Palace is the finest example of Rococo in Russia. The artistic effect of its interiors is based on constantly changing impressions and alternating nuances. The diversity of decoration is reinforced by the rooms' shapes (oval and rectangular). The modest size of the rooms, with the smooth transition from the walls to the high friezes of the ceilings, creates a sense of comfort and lends them an intimacy which is in complete accord with the subtlety and elegance of the decor. The sense of reticence and isolation which the rooms have is enhanced by the fact that the doors do not conform to the usual practice of opening one onto another en suite. Rococo compositions and plant forms are the main forms of decoration in the Chinese Palace; these include stucco moulding, wall tempera painting, parquet flooring, friezes, *plafonds* and other decorative elements. Refined and lavish stucco moulding and paintwork predominated in the palace's interior design. Ornamental murals by S. Barotsi and decorated *plafonds* by D. and P. Tiepolo, S. Torelli and other Italian artists, introduced accents of saturated colour into the existing delicate range of colours based on the relationships between Rinaldi's favourite pastel blues, greys and greens, and his pink and lilac tones.

The interiors of the pavilion at Katalnaya Gorka (1762–74) were decorated along similar lines. The gallant and playful spirit of Rococo reigns supreme in this pleasure pavilion and the impression created by Rinaldi's stucco moulding and Barotsi's ornamental murals on the wall panels in the central Round Hall and on the ceilings and floors of artificial marble

is quite enchanting. Rinaldi was the first architect in Russia to use artificial marble on a large scale as a decoration. He used it for the first time in the Chinese Palace in the wall panels and floors in the Oval Room (now lost). The unique floors made of artificial marble at Katalnaya Gorka are well preserved and of exceptional artistic value. Rococo motifs and Meissen china have been used to decorate the stairs, the Round Hall, and the two small rooms which adjoin it, the China and White Rooms.

Rinaldi also designed a park to accompany the palace at Oranienbaum. High French windows blur the boundary between landscape and interiors so that the views become an integral part of the internal decoration.

Rinaldi was an undisputed master of Rococo in the history of Russian architecture but he also pioneered the classical interior which emerged in Russia at the end of the 1760s and beginning of the 1770s. His work of the 1770s and 1780s was characterized by a rejection of intimate interiors with fantastic decoration, turning instead to simpler and more monumental forms in ordered compositions.

The interiors of Duke Orlov's palace at Gatchina near Petersburg (1766–81), which have both Rococo and classical features, are evidence of a reinforcement of classical tendencies. Unfortunately, as a result of numerous changes, only sections of these interiors and isolated details of the original decoration remain – some stucco moulding, murals and parquet flooring, and the compositional structure of the wall and ceiling decoration in a number of rooms, which, on the whole, are similar to the decoration at Oranienbaum. Design methods, which were subsequently used in the Chinese Palace, can be seen in what remains of Rinaldi's system of interior design, where several small rooms were linked together. In the main hall of the palace (the White Hall), Rinaldi imposed an order which determined the proportions and rhythms of the architectural components of the whole interior and which was worked out graphically on the flat plane in a way that was typical of classicism. At the same time, the stucco moulding depicting ornamental compositions and plant motifs, which was freely applied on the walls, was reminiscent of Rococo.

The change in style is more noticeable in the interior design of the Marble Palace in St. Petersburg (1768–85), destined to play an important role in establishing Russian classicism. The clear and balanced design of the internal space, with the main staircase in the middle and the relative isolation of the main state rooms and the living quarters, together with its noble proportions and restrained decor, subordinated to the precise rhythm of the architectural elements, gave expression to a new understanding of palace interiors. The presence of both Baroque forms and Rococo methods introduced the charm of early classicism into the Marble Palace. Although almost all the interiors were rebuilt in the 19th century, the main staircase and some of the neo-Renaissance paintings on the first tier of the walls in the Marble Hall remain. In line with Rinaldi's imposed order, the marble statues, medallions and bas-reliefs of the eminent Russian painters F. Shubin and M. Kozlovsky emphasized the architectonic nature of the interior.

As in his other interior designs, Rinaldi made wide use of the decorative possibilities of different materials – wood panelling, cloth, mural painting, plaster. His principal innovation lay in facing the walls and floors with marble; he used twelve different shades of natural stone for the exquisite

colours found in the Marble Hall. Marble introduced a delicate play of colour into the decoration of the main staircase and other rooms. In 1784 Rinaldi left Russia and ceased any active involvement in architecture or design. But, as the creator of wonderful Rococo interiors, he had cleared the way for the glorious period of Russian classicism through his tireless search for new compositional methods and artistic solutions to problems of interior design.

MARIA L. MAKOGONOVA
translated by Charlotte Combes

Biography

Born in Naples, c.1710. Studied under the architect Luigi Vanvitelli (1700–73). Moved to Russia at the request of Count Kyrill Razumovsky, 1752. Active as an architect in the service of court nobility from the late 1750s. Left Russia in obscurity, 1784, and died in 1794.

Selected Works

Examples of Rinaldi's drawings are in the Hermitage, St. Petersburg.

Interiors

- 1759–62 Peterstadt, Oranienbaum (building and interiors)
- 1762–69 Chinese Palace, Oranienbaum (interiors; also includes a ceiling by G.B. Tiepolo, wall paintings by Stefano Torelli, and marble bas-reliefs by Marie-Anne Collot)
- 1762–74 Sledding Hill Pavilion (Katalnaya Gorka), Oranienbaum (building and interiors)
- 1766–81 Gatchina Palace, near St. Petersburg (building and interiors; enlarged by Vincenzo Brenna, 1790s); Grigorii Orlov
- 1768–85 Marble Palace, St. Petersburg (building and interiors); Grigorii Orlov

Robsjohn-Gibblings, Terence Harold

1905–1976

American designer of interiors and furniture

Terence Harold Robsjohn-Gibblings's style was characterized by balanced and light-filled spaces inspired by ancient Greece. He wrote three best-selling books on interior decoration and modern art which wittily articulated the importance of refined

restraint within the home through the use of simple forms executed in beautiful materials.

Robsjohn-Gibblings was born in London and trained in architecture at the University of Liverpool and London University, where he received a degree in architecture. He held an early position as a naval architect and was soon designing interiors for passenger ships. He later worked with the antique and decorating firm of Charles of London, named for the owner Charles Duveen, brother of Lord Duveen, the famous art dealer. In 1929, Robsjohn-Gibblings was transferred to New York to work in the American office of the decorating company, where he sold Elizabethan and Jacobean antiques and woodwork to wealthy American clients. Although Charles of London survived the stock market crash of 1929, Robsjohn-Gibblings returned to London in 1933 to work for an interior designer known only as Rufus. It was at this point that Robsjohn-Gibblings turned against the decorative use of antiques, and turned his attention to classical forms, especially those found in ancient Greek furniture. He pursued his study of ancient models through the study of vase paintings and wall decorations in libraries and museums in London, Paris and Rome.

In 1936, Robsjohn-Gibblings returned to the United States and opened his own studio, Robsjohn-Gibblings Limited, at 515 Madison Avenue. His study of ancient Greek furniture led him to decorate his showroom with a mosaic floor and a combination of classically-inspired and modern furniture. Whether classical or modern in style, all of the pieces designed by Robsjohn-Gibblings displayed a simple elegance with thin, tapering lines. Some of these early pieces served as prototypes for later designs he supplied to the Widdicomb Furniture Company of Grand Rapids, from 1946. At the same time, Robsjohn-Gibblings also exhibited copies of 5th century BC Greek chairs that were later included in his collection which was manufactured by Eleftherios Saridis of Athens beginning in 1961.

One of Robsjohn-Gibblings's earliest and most extensive private commissions was the interiors of Casa Encantada (1934–38), Bel Air, California, built for Hilda Weber. Robsjohn-Gibblings's decoration of this Georgian-style mansion included furniture, such as over-stuffed club chairs, which were less restrained than his later work.

In addition to his collaboration with the Widdicomb Furniture Company, which lasted until 1957, Robsjohn-Gibblings also designed lamps for Hansen, furniture for Baker Furniture Company, and fabrics manufactured by Piraiki-Patraiki during the early 1960s, as well as accessories for other manufacturers. He created store interiors for John Fredericks, Lily Dache, Hunt & Winterbotham, Neiman Marcus and an Elizabeth Arden Fifth Avenue salon. For the Savoy-Plaza Hotel in New York, he designed the Palm Court, and his residential commissions included interiors for Mrs. Otto Kahn, Thelma Chrysler Foy, Alfred A. Knopf and Doris Duke. In 1972, he designed interiors for the Hotel Atlantis on the island of Santorini, Greece.

By 1945, when Robsjohn-Gibblings became an American citizen, he was classified as a Modernist interior designer and was included in an exhibition at the Museum of Modern Art in New York titled Good Design. In 1962, he won the Elsie de Wolfe award (American Institute of Interior Designers) for

Robsjohn-Gibbings: dining room setting for Knapp & Tubbs, 1954

interior design with another American decorator and furniture designer, Edward J. Wormley. That same year, he received the commission to design the Athens apartments of two Greek multimillionaires Aristotle Onassis and Nicholas Goulandris.

Robsjohn-Gibbings wrote three books disparaging both contemporary American interior decoration and modern art: *Goodbye, Mr. Chippendale* (1944), which was an attack on antique dealers; *Mona Lisa's Mustache* (1947), which charged modern artists and dealers with chicanery, in their swindling of the public; and *Homes of the Brave* (1954), which criticized American interior decoration as promulgated by popular journals. Robsjohn-Gibbings's style of writing for these volumes was extremely sharp and humorous, yet insightful. His last book, *Furniture of Classical Greece* (1963), was written with his long-time associate Carlton W. Pullin. As a scholarly catalogue, it was published in conjunction with an exhibition, held at the Metropolitan Museum of Art in New York, of furniture made in imitation of classical models derived from ancient Greek vase paintings and stone carvings.

Although this exhibition of furniture at the Metropolitan Museum reproduced ancient *klismos* chairs and other ancient forms, Robsjohn-Gibbings's own designs extrapolated the elegant lines of ancient models to create a more modern aesthetic which only alluded to the ancient past. His furniture designs were mostly produced in light colored woods, such as birch, oak and walnut, with linen upholstery or leather straps. His most famous designs included a *klismos* chair with saber legs (first designed in 1936), a free-form glass cocktail table on an ash base (first designed in 1942), which provoked an unsuccessful law suit by Isamu Noguchi, and "The Robsjohn-Gibbings chair" that had tapering and rounded lines and with leather strapping and linen-upholstered, buttoned cushions for

the seat and back (first designed in 1938). Robsjohn-Gibbings sometimes combined dark, rich colored fabrics or leather with the light woods to create dramatic contrasts.

In a profile of his work, published in *Interiors* magazine in May 1961, Robsjohn-Gibbings said that: "I have always believed art should transcend the time and place of its creation. It should be lasting and universal. Art, architecture and furniture cannot be judged in an arbitrary time span labeled 'modern'. Each must be seen in relationship to *all* art, *all* architecture, and *all* furniture. Artists and designers should create in three dimensions for their work to live. There must be a profound understanding of the past as well as an awareness of the present if there is to be a future."

CATHERINE L. FUTTER

Biography

Born in London, 1905; emigrated to the United States, 1930: naturalized, 1945. Apprenticed as an architectural draughtsman, London; studied architecture at the University of Liverpool and London University. Worked briefly as a naval architect; appointed head designer, Ashby Tad Ltd., London, 1925-26; art director, British International Pictures film company, Elstree, Essex, 1927; worked for Charles Duveen (Charles of London) antiques and furniture firm, London, 1928-29, and New York, 1930-33; worked in London, 1934-35. Practised independently as a designer of interiors and furniture from 1936; established Robsjohn-Gibbings Ltd., New York, 1936-64; sole designer for Widdicomb Furniture, Grand Rapids, Michigan, 1946-57; designer for cabinet-makers, Saridis, Athens, from 1961. Settled in Athens where he worked as an interior designer from 1964. Received the Waters Award, New York, 1950, and the Elsie de Wolfe Award, New York, 1962. Published several important books on contemporary art and interior design. Died in Athens, 20 October 1976.

Selected Works

Robsjohn-Gibbings created store interiors for John Fredericks, Lily Dache, Hunt & Winterbotham, Neiman Marcus, and Elizabeth Arden. He designed the Palm Court for the Savoy-Plaza Hotel, New York, and his numerous residential commissions included interiors for Mrs. Otto Kahn, Thelma Chrysler Foy, Alfred A. Knopf, Doris Duke, Mrs. J. O. Weber (1938), Bruno K. Graf (1958), and apartments for Aristotle Onassis, Athens (1962), and Nicholas Goulandris, Athens (1962). His furnishings included designs for the Widdicomb Furniture Company, Grand Rapids, 1946–57, and the Saridis Company, Athens, from 1961, lamps for Hansen, and fabrics for Piraiiki-Patraiki.

Rococo

Much confusion still surrounds the word Rococo and its application in art and design but, in general terms, it describes the elegant and fanciful decorative style introduced in France in the first half of the 18th century, which spread with varying degrees of influence across Europe and her colonies. The exact chronology of the style has likewise been subject to debate. A significant change in fashion had begun in France by 1700 but the full-blown Rococo (known as the *genre pittoresque*) did not come to dominate French interiors until c.1730–55, and it continued in other countries until the 1780s and occasionally beyond. Similarly, many art historians have in the past viewed the Rococo simply as the final stage of the Baroque, drawing its inspiration directly from Italy, hence the term Barocco. This idea may have developed from examples of interiors mainly outside of France, where features of both the Baroque and Rococo have been used. More recent commentators, however, have made clear distinctions between the two stylistic move-

ments and it is now widely accepted that while Italy and Italian craftsmen undoubtedly enriched the Rococo, the style's origins were French. Indeed, the Rococo was an independent style arising out of a reaction to Baroque art and decoration and it represents perhaps one of the most original styles in the history of Western design.

Traditionally, the social movement that inspired the Rococo has been characterised as a bored aristocracy, whose desire to break free from the pompous etiquette and oppressive morality of the ageing Louis XIV's court lead them to search for diversion and novelty in a new, more frivolous style. This view, however, is perhaps too simplistic. Although the zenith of the Rococo did not occur until the 1730s, it was prefigured by a gradual move towards greater freedom in design that had evolved over a fifty-year period and that ironically appears to have been initiated under the patronage of the crown at Versailles and other royal palaces. Louis XIV's wish for change is indicated by his oft-quoted remarks regarding the new apartments for the Duchesse de Bourgogne in the Château de la Ménagerie, Versailles (1699) in which he declared: "It seems to me that something should be changed, that the subjects are too serious, that their should be youthfulness mixed with what we do. We need childhood spread throughout." Nevertheless, the Rococo period saw a shift away from the dominance of the king and the Versailles court towards the Paris-based, wealthy middle classes whose commissions were often as sumptuous as those executed for royalty and aristocracy.

In its purest form, the new style was far removed from the interior schemes hitherto employed which strictly observed the classical "orders" of architecture and which were characterised by bold opulence, plasticity, and, above all, a rigid distinction between the dominant architectural structure and the surface decoration. In contrast, Rococo interiors were a-tectonic, in that the most representative eschewed architectural forms such as pilasters and columns. If the entablature was employed at all, it was reduced down to a single moulding with little resemblance to an acknowledged "order", and in the more extreme cases, the division between wall and ceiling disappeared altogether in a gentle curve. The increasing lightness of design was complemented by the use of more delicate colour schemes as opposed to the rich, deep colours characteristic of the Baroque style. White and pastel shades (particularly pinks, blues and greens) were preferred, sometimes enhanced with gold or silver. Ceilings were decorated with fragile stucco-work on a plain surface and with light, airy and more strictly decorative painted areas, all of which added to the effect of harmony, elegance and charm.

The move away from the Baroque style developed concurrently with ideological changes within the wealthy social elite who combined an interest in idealised notions of rustic pursuits with a greater emphasis on pleasure, informality and intimacy, the essence of which was encapsulated in the *fête galantes* paintings of Antoine Watteau (1684–1721) and the genre scenes of Carle van Loo (1705–65) and Jean-François de Troy (1679–1752). These sentiments were also echoed in the layout and size of rooms, as well as in the decor, a development which is vital when assessing the impact of Rococo interiors. Mirrors were used to greater effect; they often alternated with tall windows which flooded the room with daylight to give a sense of space, and, at night-time, they enhanced the candlelight

playing across the walls and furnishings. Such changes were acknowledged by contemporaries. In his *Discours sur l'architecture* (1754) Pierre le Patte observed "Previously dwellings were designed purely for display, and nothing was known of the art of living in comfort, for one's own benefit. It is the pleasing distributions of space in the hôtels of the present day that transforms our dwellings into abodes of charm and delight." Thus the Rococo blossomed not so much in the grand halls which convention still demanded be decorated in a formal courtly style, but in the private apartments of Parisian hôtels and the *maisons de plaisance* of the capital's environs where the wealthy could indulge their artistic whims with greater freedom. The inherent frivolity and endless novelty of the new style perfectly complemented the prevailing social mood.

A distinctive feature of the Rococo *per se*, was the nature and employment of its decorative repertoire. Ornament now signified more than ever before. In fact, the Rococo period saw it gain independence and finally triumph over its traditionally subordinate role to architecture. At the height of the Rococo period in France the architect Jacques-François Blondel wrote "We have freed ourselves from the slavery of squares and circles to which tradition had formerly bonded us ... in the last few years more life and less dryness has been introduced in ornament" (1737). It is appropriate then that the Rococo should make itself felt most strongly in the decorative arts. However, painting (especially works destined for a specific interior), sculpture and to a lesser extent architecture were also affected, and even though few Rococo buildings exist in France, examples such as Matthäus Pöppelmann's Dresden Zwinger (1709–32), demonstrate that Rococo's reputation as a purely interior style is misleading.

The word "Rococo", which was originally coined in Parisian artists studios in the late 18th century to ridicule the style of painting under the *ancien régime*, may have derived from *rocaille*, the incrustations of watery rock and shellwork which decorated fashionable grottoes and caves in aristocratic gardens. The application of *rocaille*-inspired ornament within interiors and to all manner of decorative objects was one of the most original characteristics of the Rococo style. The other was asymmetry, which was often exploited to the full. In rejecting the symmetrical arrangements and many of the decorative motifs associated with the Baroque (e.g., Vitruvian scrolls, ox-skulls, goats-hooves) the Rococo developed a novel, "anti-classical" stance, which looked to nature and naturalistic rhythm for inspiration. Ornament proliferated, whether carved, cast, moulded or painted. Flowing S- and C- curves manifested themselves in sinuous scrolling, cartouches, plant-life (twisting vines and acanthus, sprigs of flowers, reeds) bat-wings, decorative details like sprays of water and, of course, *rocaille*, all of which wilfully avoided straight lines. The air of fantasy and movement was further enriched with exotic motifs (such as *singeries* and *Chinoiseries*) inspired by oriental design. The fashionable surface decoration called grotesque, although already part of the European design tradition, took on a fresh, elegant and increasingly attenuated appearance. Jean Berain, whose name has become synonymous with such schemes, began the process of transforming grotesque ornament into the "rococo arabesque" from the late 1670s and also introduced monkeys (*singeries*) into the figurative repertoire. By the end of the century, Berain's work was overtaken by the even lighter

and freer designs of Claude III Audran, Claude Gillot and Antoine Watteau. Watteau's schemes of Commedia dell'Arte characters and elegant Orientals surrounded by a graceful framework, although not great in number, proved widely influential when published as engravings, and underline the changes in structure and subject matter that occurred during the period.

The influx of new artistic talent from the Mediterranean helped to simulate the move to greater three-dimensionality in ornament during the early phase of the style. One of these craftsmen, Jean-Bernard-Honoré Toro (1672–1731), published volumes of engravings in Paris between 1716 and 1719, which included the *Desseins Arabesques à plusieurs usages*, showing for the first time *rocailles* and other precociously swirling forms in the budding Rococo manner. Fresh impetus in the break from the past occurred during the 1730s in the designs of Juste-Aurèle Meissonnier (1695–1750), Nicolas Pineau (1684–1754) and Jacques de Lajoüe (1686–1761), whom Blondel later named as the creators of the true Rococo or *genre pittoresque*. The architect, designer and sculptor Meissonnier, in particular, has frequently been referred to as the father of Rococo, and he developed a rigorous, strongly sculptural and asymmetrical Rococo manner which found its ultimate expression in three-dimensional forms. Current knowledge of Meissonnier's work is largely derived from his engraved designs such as his *Livre d'ornement* and *Oeuvres* (1750) in which *rocaille* becomes both decoration and architecture, but often (as is frequently the case with engraved designs) in a form that is both impossibly fantastic and more exaggerated than any employed in an actual French interior. Nevertheless these books were very influential in disseminating a more extreme version of the style abroad, particularly in Central Europe. Jacques de La Joue was a highly respected architectural painter, and from the mid-1730s he too developed a more exaggerated version of the Rococo, with designs of architecture often distorted into a wave of crests and *rocaille* forms. His engravings, above all his *Quatre livres d'architecture, paysages et perspectives* (1740), serve as a French equivalent to Meissonnier's more Italianate dynamism and solidity. One of the few practical examples of his work to have survived is the six-leaf screen (c.1735–40), decorated with garden scenes enveloped in a fanciful, Rococo cartouche that is now in the Musée du Petit Palais, Paris. Nicolas Pineau, who studied under the architects Jules Hardouin-Mansart and Germain Boffrand, also developed a style which fully utilised the Rococo decorative repertoire but with far greater delicacy than either Meissonnier or La Joue. His work proved influential in many parts of Europe and many of his designs were reissued as engravings, above all in Augsburg.

The Rococo style touched every aspect of interior decoration, particularly carved wood, stucco or plasterwork and metalwork. These media translated perfectly into even the most extravagant of designs and allowed craftsmen fully to demonstrate their skills and flair. Craftsmen also exploited to the full the potential for voluptuous or delicate shapes in porcelain. Both the Royal Factory of Sèvres and the Meissen factory produced a variety of items ranging from vases and useful wares (including wall-lights and candlesticks) to figurines, all of which adopted the Rococo passion for novelty. Furniture, whether decorated with paint, marquetry or lacquer, adopted curves in keeping with the new fashion for asymmetry

and comfort, and seat furniture, especially the armchair or *fauteuil*, was generously upholstered in silks and tapestries. Case furniture could be equally rounded, and the form and decoration of the commode made by Antoine Gaudreau in 1739 for Louis XV's bedchamber at Versailles (Wallace Collection, London) resists any notion of a flat surface, with the flamboyant gilt-bronze mounts swirling across the light-coloured wood marquetry. Chandeliers, sconces, and candelabra were twisted into natural forms and sported branches like foliage. Two gilt-bronze chandeliers (1751) made by the sculptor Philippe Caffiéri and given by Louis XV to his daughter, the Duchess of Parma, also in the Wallace Collection, perfectly express the spirit of the style in their adoption of natural motifs and movement. Clocks, most particularly the cartel clock, also adopted the new style so successfully that the cases could be considered as examples of Rococo sculpture. Some of the finest were made by the *ébéniste* and sculptor, Charles Cressent (1685–1768).

The preference for softer colours and frivolous subject matter also held sway in paintings intended for interiors. Artists such as François Boucher (1703–70) closely identified with the Rococo, and focused on sensuous and playful subjects depicting the loves of the Gods, gentle pastorals and landscapes and *fêtes galantes*. Many paintings were destined to be set into Rococo frames in the areas above doors, thus emphasising the decorative function of such works. Perhaps the most representative ensemble of Rococo paintings produced for a specific interior were those for the Hôtel Soubise, Paris (1730s), which included works by Charles Natoire (1700–77) and Boucher. Tapestries (both for hanging and upholstery) closely resembled Rococo paintings, and the designs emanating from Beauvais were dominated from 1736 by Boucher who produced some of the most successful tapestry series ever woven by the factory.

In terms of the manifestations of the style in specific interiors, the development of the Rococo style can be seen to have had several stages. The initial transition period from the Baroque can be observed in the rooms decorated in the last fifteen years of Louis XIV's reign by Jules Hardouin-Mansart (1646–1708) and his assistants. It is here that some historians have identified the vital step towards the Rococo, namely the translation of Jean Berain's ornamental style into three-dimensional forms, which were then incorporated into frames and *boiseries* or on decorative panels themselves. This development survives at Versailles, for example, in the *Salon de l'Oeil Boeuf* (1701) where the new style in arabesque and ribbonwork was employed by Pierre Le Pautre on the doors, in panelling below the paintings and around the window areas. Henceforth, the true stylistic initiative was taken in Parisian hôtels. In the Petit-Luxembourg (1710), the architect Germain Boffrand (1667–1754), who was a pupil of Hardouin-Mansart, designed lighter interiors with the decoration focused in the spandrels between the arches and in the running ornamental frieze of the coving. This forms a gilded structure of joined C-curves with floral garlands and palmettes, interspersed with putti and birds. The influence of Jean Berain can also be observed, as with the more fantastic figurative motifs that Boffrand used at La Malgrange (c.1712). Stylistically however, while the ornament is more graceful and elegant, the overall concept remains rectilinear, with the decoration subordinate to the architecture.

The *Régence* style (a modern term) marks the initial phase of the Rococo proper, extending beyond the dates of the Regency itself (1715–23) to c.1730. The most important decorative ensembles of this period were executed by Gilles-Marie Oppenord (1672–1742), who trained in Rome and worked directly for the Regent, Philippe d'Orleans, and his immediate circle (e.g., Grands Apartments, Palais Royal, 1720). The other notable architect and sculptor of this period was François-Antoine Vassé (1681–1736) who worked in the service of the Bâtiments du Roi (e.g. Galerie Dorée, Hôtel de Toulouse, 1718–19). Both Oppenord and Vassé had a strong influence on subsequent developments, although even their most stylistically advanced interiors remain restrained in the use of asymmetry and C-scrolls. The final move came with the interiors of Jacques V Gabriel (e.g., Le Grand Salon, Hôtel Parabère (1718–20)), and Jean Aubert whose work in the Hôtel Lassay (c.1728) attracted enormous attention among his contemporaries. Gabriel's scheme for the Grand Salon, in particular, teeters on the very brink of the Rococo style. Ornament predominates and paintings are consigned to over-doors; the distinction between wall and ceiling is dramatically reduced; and the delicate tendrils of the central ceiling rosette spread out towards the continuous curvilinear decoration adorning the border of the ceiling and curved cornice, the latter occasionally interrupted by the swelling forms of cartouches. Natural motifs abound and the ornament achieves a new rhythm which begins to break away from the traditional constraints of the architecture. It was in the exploration of these characteristics that the full-blown Rococo style emerged.

Of the three men mentioned by Blondel as the authors of the *genre pittoresque*, the most prolific in terms of interior design was Nicolas Pineau, whose work can be counted among the finest examples of the Parisian Rococo to survive. The Salon Rouge within the Hôtel de Roquelaure (c.1733) typifies Pineau's lightness of touch and extraordinary imaginative powers. Wispy tendrils and garlands, *rocaille* and ribbonwork, are united with seemingly effortless grace and exemplify Cochin's comment in 1755 that ornamental motifs in the hands of Pineau were "manipulated with such delicacy that they almost entirely vanished from view: within a given space, he was able to multiply their number six-fold."

Boffrand's Hôtel de Soubise, Paris (1735–39) was even more magnificent. The interior reaches a crescendo on the lower and upper floors with two central oval salons – the Salon du Prince and the Salon de la Princesse. The latter, in particular, is heralded by many as the supreme manifestation of Parisian Rococo. Still *in situ*, the decorative ensemble represents an unprecedentedly rich combination of gilded wood, stucco and painted reserves with mirrors and windows. The supremely decorative paintings by Charles Natoire depicting the legend of Cupid and Psyche (1738) which fill the spandrels between the arches, reflect the fresh, *galant* spirit of Rococo mythological scenes. The gilded ornament of natural forms and the curve of the mouldings gently undulate around the room and upwards into the smooth curve of the ceiling where delicately perforated balusters meet in a central rosette. But in terms of the vital elements of the full Rococo style, the reputation of this room must be qualified and it is ultimately much more conservative than Pineau's work. Boffrand eschews asymmetrical effects and the Baroque tradition remains largely intact within the robust

Rococo: Goldene Galerie, Schloss Charlottenburg, by G.W. von Knobelsdorff, 1740–43

mouldings and the solidity of the decoration. The architectural framework, although in itself much less rectilinear, is not superseded by the decoration.

Chinoiserie, with its inherent exoticism, asymmetry and novelty, proved to be the perfect stylistic companion to the Rococo, and so successful was the union between these two styles, that “Rococo Chinoiserie” must be viewed as one of the most distinctive characteristics of the Rococo movement. Moreover, the perceived “foreignness” of the East allowed for greater artistic licence, and moved the Rococo yet further from classicism.

Unlike previous interpretations of the Orient, the Rococo exploited the epicurean nature of the East, incorporating scenes ranging from gentle landscapes with rustics fishing to languid scenes of sophisticated oriental “aristocrats” barely distinguishable from their Parisian counterparts, all executed in the spirit of the *fête galante* or pastoral. Inevitably, some of the most influential artists associated with the Rococo style were also integral to the development and popularity of Rococo Chinoiserie. These included Watteau, whose designs for the château of La Muette were particularly influential and some of which were published as engravings in *Figures Chinoises et Tartares* in 1731. Another important figure was Boucher, who not only devised a Chinese boudoir for Madame

de Pompadour at the château of Bellevue, but also designed highly successful Chinoiseries woven by the Beauvais tapestry works, and published engravings which were copied in many media particularly by craftsmen in Northern Europe. Two of the best-preserved Rococo Chinoiserie interiors are Le Grande and Le Petit Singeres of the Château de Chantilly (c.1735) by Christophe Huet. Generally accepted as masterpieces of their kind, these rooms are decorated with a series of large panels which are painted with Chinese characters whose attendants are monkeys in oriental dress. Each panel is enclosed within an elaborate, gilded wooden frame decorated with natural motifs. Elsewhere, monkeys are seen playing and hunting on the doors and around the stucco scrolling of the ceiling, along with a plethora of other animals, exotic birds and garlands of flowers. The whole effect perfectly illustrates the spirit of the style not only in its emphasis on delicacy and decorativeness but also in its light-heartedness and sense of humour.

Mention should also be made of Jean-Baptiste Pillement (1778–1808), who was the last great designer of Rococo Chinoiserie and who remained active up to the 1780s when the Rococo was all but finished. Pillement’s work was characterised by its ethereal, whimsical qualities, a style more in keeping with Watteau than the more robust Boucher. His many foreign commissions included a Rococo pavilion at Sintra in

Portugal and a Chinoiserie study for the king of Poland. His designs were also used in panels and on silks and cottons and many other decorative media. One of his few surviving interiors is the Salon Pillement in the Château de Craön, Haroué (c.1750), a small, circular room, which was decorated with delicate painted arabesques and oriental scenes on a ground of powder blue and white scrolling. There are a number of other surviving examples of Rococo Chinoiserie in Europe, including the tea house in the grounds of Sanssouci Park, Potsdam, the porcelain room from Portici, now in the Capodimonte Museum, Naples, and the Chinese pavilion, Kina, in Drottningholm, Sweden, whose refreshingly light interiors include designs not only by Pillement and Boucher, but also the English designer, William Halfpenny (d.1755).

From the 1730s, the influence of the Rococo spread throughout European countries and their colonies, where it developed in association with princely courts or as a regional style – as in Prussia and Venice – or was assimilated into the existing traditions of the late Baroque or alongside the Palladian and Gothic styles – as in Britain. The production of engravings proved to be its most powerful ally, flooding the market with illustrations of the latest fashions in ornament and room elevations. These were published not only in Paris, by influential engravers such as Gabriel Huquier (1695–1772), but also in foreign centres, above all in Nuremberg and Augsburg. Concurrent with this was the direct involvement of French- or Paris-trained architects such as Nicolas Pineau in Russia, Germain Boffrand in Würzburg, François Cuvilliers in Munich and Jean Pillement who worked in many of Europe's major cities including London.

The Rococo style had a particularly strong influence within the German states of central Europe – Austria, Prussia, Swabia, Bavaria, etc. – where it was most influential from the late 1730s up to the late 1760s. It took hold not only through the employment of French architects, but also through the talents of native architects, decorative engravers and stucco-workers. Many produced extraordinarily imaginative and skilful interiors that took the spirit of the Rococo into realms of fantasy and asymmetry far beyond that found in the more orthodox French designs, and in contrast to the French preference for graceful forms, the Germans delighted in more irrational abstract forms.

The Rococo was also applied more extensively within religious buildings in Germany than in France, where the style was essentially secular. Thus some of the most dynamic interpretations were realised within the pilgrimage churches, above all of rural Swabia and Bavaria, with examples including Balthasar Neumann's Vierzeheiligen (from 1743) and Die Wies (1745–54) in the foothills of the Alps. Die Wies in particular exemplifies the "Bavarian Manner" (white or coloured stucco with important decorative details highlighted in gold) as perfected by Dominikus Zimmermann and his brother, Johann Baptist.

German princes also admired and emulated the intimate French pavilions, pleasure houses and hunting lodges. Frederick the Great, King of Prussia, in collaboration with the aristocrat / architect, Georg Wenzeslaus von Knobelsdorff (1699–1753), realised many architectural and interior projects including those at Schloss Charlottenburg and the Stadtschloss in Berlin in the 1740s. None, however, equals the charm and

intimacy evoked by the small *maison de plaisance*, Sanssouci (Potsdam, Germany), which was built from 1745 as a quiet retreat in which the king could conduct affairs of state and entertain. Although the central reception hall (the Marmorsaal) retains a certain grandeur, the suite of rooms leading from left and right are informal and are decorated in a light and pleasing style. Frederick was a talented musician and placed particular importance on the Music Room (c.1747). The painted over-doors and *galant* mythologies on the main walls are set within gilded, asymmetrical cartouches of foliage, flowers and grapes. Other motifs include putti dancing and playing, and trophies of musical instruments. Gilded trellises surround the mirrors as if the room were in fact a garden setting, the sense of which is continued in the ceiling of gilded stucco on a white ground. Here, the decoration forms an arbour of trellis work with trailing vines and fountain-like sprays, executed in steep perspective so that it appears to be pushing up into the sky. In the centre, stretching out as if attached to the trellis, is a fantastic spider's web, a witty variation on the ceiling rosette.

The close political ties between the Bavarian court and France meant that the Rococo emerged somewhat earlier in this region than elsewhere and François Cuvilliers (1695–1768), who trained as an architect in Paris between 1720 and 1724, played an important role in the introduction of the style. Cuvilliers's work exemplifies the French manner that was used almost exclusively at court and he created a splendid scheme of decorations in the Reichen Zimmer (Rich Rooms), the parade rooms of the Munich Residenz (1730–37). His supreme achievement, however, was the small hunting lodge called the Amalienburg (1734–39) in the Nymphenburg Park, near Munich, where he worked in partnership with Johann Baptist Zimmermann. The simplicity of the external architecture is in startling contrast to the drama of the interior, and the decoration, combined with the light airiness of the rooms, makes the Amalienburg one of the most refined examples of the Rococo anywhere in the world. The circular Spiegelsaal (Room of Mirrors) is Cuvilliers's masterpiece. The light pours in through the windows and shimmers in the tall mirrors and across the ornament of musical instruments and motifs of rural pastimes and birds soaring across the blue sky. Figures seated casually on the cornice line are surrounded by plant life which creeps up into the domed ceiling. Almost *al fresco* in effect, this harmonious interior rivals anything that was produced in France, and makes the contemporaneous decorations of the Hôtel Soubise seem almost heavy and monumental.

Adherence to Baroque traditions resulted in a late maturing of the Rococo style in Franconia, and above all in the Catholic bishoprics of Würzburg and Bamberg. In Würzburg, under the court architect Balthasar Neumann, the results were so exuberant and distinctive that they are sometimes known as "Würzburg Rococo". Neumann himself occupies a position between the late Baroque and the Rococo; his secular work often remains close to Baroque principles, but the decoration is uncompromisingly Rococo. One of his most significant projects was the building of the Würzburg Residenz, where a group of artists led by the court stuccoist, Antonio Giuseppe Bossi, was assembled to execute the decorations. In the Weissersaal (1744–45) Bossi's white stuccowork, which forms the principal decoration on a pale grey background, shows him

Rococo: Salon Doré, Hôtel de Matignon, Paris, 1725

to be a genius in Rococo ornamentation. The delicate tendrils, charged with energy and rhythm, flicker upwards towards the ceiling as if the room were alight. Adjoining the Weisseraal lies the domed Kaisersaal, which was spectacularly decorated with a lively pageant of stucco, marble and fresco. Among the many artists and craftsmen who worked on this room was Giambattista Tiepolo whose celebrated fresco cycles within the Residenz are acknowledged masterpieces of 18th-century decoration.

The area of present-day Belgium experienced direct French influence with the occupation of Louis XIV's troops in the early 18th century. But it was with the withdrawal of his successor's army in 1748 that building projects began to accelerate, producing a combination of both the Rococo and Flemish Baroque. Architecture in Ghent was dominated by two local architects, David 't Kindt (1699–1770) and Bernard de Wilde (1691–1772), the latter being more adventurous in his designs. The Hôtel Falligan (1755), attributed to de Wilde, is an example of the "Ghent Rococo". Both the gaming room, with its stuccowork and grisaille overdoors of playful putti, and the drawing room, decorated with painted panels set into Rococo frames, illustrate the light, charming style that was adopted by local artists and craftsmen. The painted panels of the drawing room are the work of Emmanuel van Reijsschoot, a member of a family of Ghent artists who specialised in this type of work. In Liège, Rococo interiors can be seen in the Palace of the Prince-Bishops, including the former throne room which has Rococo frames, ornament, and panelling (originally painted pink), and the chancery of the Privy Council, known as the Chinese Room, which has a Chinoiserie ceiling decoration by the artist Paul-Joseph Delcloche (1716–55). The Rococo decoration of the Leda Room in the Château de Colonster contains a painted overdoor dated 1763 from which the room takes its name and *singerie*s on the ceiling attributed to the Lorraine painter Joseph Billieux.

In Italy, the Rococo developed into regional styles, although Rome with its strong classical and Baroque traditions remained largely unaffected. In Northern areas, the proximity of the border with France and Germany may have resulted in the more direct influence of French models, for example, in Turin, Genoa and Venice, where rooms were often decorated in a true Rococo fashion. The court of Turin, in particular, moved towards a style of the Rococo that was as close to France as could be found anywhere in Italy. The suite of small rooms in the Palazzo Reale, designed by Benedetto Alfieri (1700–67), who was first architect to the king, exemplifies the delicate style that was favoured in many royal and ducal residences. Turin was also second only to Venice in the production of lacquer, the employment of which can be seen within the palace in a room dated 1735. This striking interior boasts numerous pieces of black, red and gold oriental and Italian lacquer set into elaborate Rococo gilded frames on a rich vermilion ground. In general, however, the application of the Rococo was always Italian in flavour. Some commentators have also linked the Italian Rococo with the early decorative vocabulary of Borromini.

The Rococo had a strong impact on Venetian interior design – Venice was the birthplace of Tiepolo, arguably one of the style's greatest exponents. The style lingered until the 1790s and was closely linked to the frivolous spirit of the Venice

Carnival. It flourished, as in France, within more intimate rooms, and a series of such interiors can be seen in the Palazzo Foscari, in which the ceilings are simply but effectively decorated with gilt Rococo scrolling and flying birds, and Chinoiserie scenes made up of tiles painted in gold on a white ground adorn the walls. The collection in the Museo del Settecento (Ca' Rezzonico) also demonstrates the influence of Rococo on almost every area of the decorative arts from lacquered and gilded furniture to silks, cottons, glass and stuccowork. The period interiors within the museum include the Camerino degli Stucchi, originally executed for the Palazzo Calbo Crotta at Cannaregio, and decorated with exuberant Rococo stuccowork.

Neapolitan Rococo tended to lack the sophistication and lightness of its French counterpart, but was still lively and colourful in the best tradition of Southern Italy. Nevertheless, very few interiors remain that could be classified as pure Rococo, many palaces and villas having been destroyed or adapted. A fortunate exception is the series of rooms behind the chapel of the Monte di Pietà, decorated with frescoes and stuccowork in light Rococo designs (c.1740s). An extraordinary Rococo gem also exists in the form of a tiny gilded and mirrored study (1732) by Filippo Buonocore in the Palazzo Corigliano whose vibrant decorative details include scrollwork, floral sprigs and reeds, fantastic creatures and animated human figures, forming a series of interconnecting frames within which are set mirror panels. And perhaps the most famous example of Neapolitan Rococo is the porcelain room originally from the Villa Reale at Portici, but now on exhibition in the Museo di Capodimonte. Designed in 1757 by Johann Sigismund Fischer and made at the Capodimonte factory, the room is decorated entirely with colourfully painted porcelain, except for the mirrors and coloured stucco of the ceiling. The porcelain forms a complicated matrix of figures, motifs and undulating lines and includes Chinoiserie panels, trellis work and musical trophies. Stylistically, however, the room has more in common with the German Rococo than with Italian counterparts, and its origins lay in the Porzellanzimmer in the Munich Residenz, Sanssouci, and the Amalienburg.

The geographical remoteness of Sicily meant that it was less influenced by the Rococo than might be expected but a stunning example of the style survives in the Sala degli Specchi (ballroom c.1750) in the Palazzo Gangi, Palermo. The room is lit by two rows of windows between which are hung mirrors elaborately framed. Each window has a set of shutters which are painted with floral motifs and gilded ornament and the decoration of the walls includes swirling Rococo forms and trellis work. When the room is prepared for a ball, the shutters are closed and the guests are totally enveloped in a complete Rococo fantasy.

As in Germany, Swedish receptiveness to the Rococo was greatly enhanced by the close cultural ties between the French and Swedish courts in the late 17th and early 18th centuries. The Tessin family of architects was particularly important within this context with Nicodemus Tessin the younger (1654–1728) and his son Carl Gustaf (1695–1770) actively transmitting the new style from Paris to Stockholm. Its use at court was also encouraged by royal links with Frederick the Great of Prussia whose sister, Lovisa Ulrika, was married to the king of Sweden. In 1754, Queen Lovisa commissioned a tea-

house in imitation of Frederick's tea-house at Sanssouci, and in 1763 her Chinese pavilion at Drottningholm was replaced by the Chinoiserie fantasy of Kina, designed by the court architect Carl Fredrik Adelcrantz. Carl Hårleman (1700–53) was the most influential exponent of the Rococo style in Sweden, and his work following his training in Paris marks the birth of Swedish Rococo. At the height of his career Hårleman was in control of all state architecture and prepared designs for official buildings and government residences. A great admirer of French models, he seems to have been particularly influenced by his friend, Charles Etienne Briseux, who published several pattern books in the French style, and he supervised a large number of French artists who worked on the redecoration of the Royal Palace in Stockholm. This project was begun in the late 1720s and continued during the 1730s, spanning various stages in the progression of the Rococo style. Hårleman's work outside the royal circle included Rococo buildings and interiors for Carl Gustaf Tessin at Åkero, and for Baron Ramel at Ovedskloster. Begun in 1745 and completed in the 1760s, Ovedskloster encapsulates in a single building Hårleman's interpretation of the Rococo.

Although French influences were evident in Russia during the reign of Peter the Great (1672–1725) – notably in the work of the architect A.J.B. Le Blond (1679–1719) and Nicolas Pineau who were active at the Russian court from 1716 – it was not until the accession of Elizabeth Petrovna (reigned 1741–62) that the Rococo style was fully embraced. A committed Francophile, Elizabeth also had a rapacious appetite for building and for richly decorated interiors. Her chief architect was the Italian-born Bartolomeo Rastrelli (c.1700–71) whose highly personal Russian version of the Baroque was developed by the 1740s and was evident in buildings such as the Winter Palace, St. Petersburg (1754–68). Rastrelli also designed some exceptionally rich and vigorous Rococo interiors in the palace of Tsarskoe Selo (now extensively restored).

The assimilation of the Rococo in England should be viewed in the context of English architecture and design at the time. It was preceded by the adoption of several European styles, including the Italian late Baroque, but, most importantly, from 1715 the Palladian style. In addition, two styles developed concurrently with that of the Rococo; that of the Gothic and the Chinese. It was not unusual, therefore, to see elements of all three styles within the same design. A taste for variety might also persuade a client to commission a series of rooms treated in different styles, one eccentric example being the Classical, Gothic, Chinese and Rococo interiors at Claydon House, Buckinghamshire. Here, the builder and carver Luke Lightfoot (c.1722–89) created extraordinarily elaborate designs in carved wood (c.1769) which represent some of the finest examples of Rococo decoration in England.

Most English forms of the Rococo were derived from the French *genre pittoresque* which was fostered by the many Huguenot craftsmen working in London. The draughtsman and engraver Hubert Gravelot (1699–1773) was particularly influential and greatly encouraged the adoption of the style in all branches of the decorative arts through his published designs and teaching. Other important figures were the designers Matthias Lock (c.1710–65) and Henry Copland (c.1706–53) who collaborated on *A New Book of Ornaments* in 1752, and Thomas Johnson (1714–after 1778) whose

engraved designs for carving, metalwork and furniture were vigorously asymmetrical.

In the course of time the influence of the Rococo style in England was felt in many different spheres ranging from porcelain and silks to carving and stuccowork. Its impact on furniture is best illustrated by the work of Thomas Chippendale (1718–79) whose famous *The Gentleman and Cabinet-Maker's Director* (1754, 1755, 1762) included several items in the Rococo style. Nevertheless, unlike in France and Germany, very few complete interiors in England were executed in the Rococo style, many being a mixture of classical and Rococo decoration with perhaps one of two items of Rococo furniture. The leading stuccotors – the Artari brothers and the Vassalis family – were from the Ticino (now Italian-speaking Switzerland) and popularised the Rococo fashion for purely abstract ceilings and wall designs. The most talented native plasterers included the Perritt family in York and the Rose family in Doncaster. Joseph Rose the elder executed confident Rococo decoration (probably from his own designs) at Heath Hall, Wakefield, Yorkshire (1758).

Most English interiors of this period had walls hung with silk damask, and French-style *boiseries* were not popular. However, the existence of a few examples such as the Music Room, Norfolk House (now in the Victoria and Albert Museum, London), the White and Gold Room (1753), Petworth, and Isaac Ware's interiors at Chesterfield, part of which survive at the Bowes Museum, Durham, serve to show that the English Rococo style was not exclusively expressed through furniture design as has been argued by historians such as Fiske Kimball.

The American Rococo was primarily an urban style that emerged in the 1740s; it was at its strongest from approximately 1750 to the 1770s, and was in decline by the 1790s. American craftsmen and designers relied heavily on English engravings, including those of Copland and Locke and Chippendale's *Director*, which found particular favour in Philadelphia. The style was also popularised by the direct importation of finished products and the arrival of immigrant craftsmen, many of whom were trained in London. Hence the centres of the American style were those cities that had close trading links with England, for example, Boston, New York, Philadelphia and Charleston.

American craftsmen concentrated mainly on ornament. Thus rooms were often quite simple with Rococo elements serving as a decorative focus or cheerful flourish, for instance, on fireplaces or over-door mantles, and in stuccowork of which very little survives. Examples include a Rococo chimneypiece in East Apthorp House, Cambridge, Massachusetts (1760–61) and an elaborate Rococo ceiling in the Phillips Manor House, Yonkers, New York (1756), the latter being one of the earliest examples of American Rococo in the area. The Van Rensselaer Manor House (1765–68), Albany, whose entrance hall is displayed at the Metropolitan Museum of Art, represents the most complete Rococo interior from New York. Although the walls follow the Ionic order, the bright hand-printed wallpaper from London (1768) includes grisaille landscapes of the four seasons and scenes of classical ruins within *trompe-l'oeil* Rococo frames. The designs of scrolled foliage in the spandrels of the archway were taken directly from Lock's *New Book of Ornaments*.

The anti-classical and a-tectonic nature of Rococo that had initially proved so appealing ultimately led to the style's downfall, and its detractors strongly criticised its apparent lack of discipline. It was also perhaps more difficult to master than is generally realised, especially in the sense of achieving a stylistic equilibrium. In skilful hands, the plethora of decorative motifs and asymmetrical bias was handled with an exquisite poise that allowed for the free movement of ornament while retaining a sense of structure. Alternatively, however, it could be (and sometimes was) misused, resulting in a giddy excess of ornament and clumsy asymmetry. The style was openly attacked by the 1730s, and Blondel himself derided the "ridiculous jumble of shells, dragons, reeds, palm-trees and plants which is the be-all of modern interior decoration" in his *De la Distribution des Maisons de Plaisance* of 1737. Between 1750 and 1770, it was gradually overtaken in France and in the rest of Europe by the growing popularity of Neo-Classicism.

Criticisms of the Rococo came from two camps: the classicists and the traditionalists. The classicists harked back to Antiquity drawing inspiration not only from the arts but also from the supposed spiritual purity and moral strength of Greece and Rome. To them, the hedonism and undisciplined nature of the Rococo was closely linked to the moral degeneracy of society under Louis XV. An even stronger impetus for change came from the traditionalists' camp, who came to see the reign of Louis XIV as the glittering period of French architecture and interior design. The demise of the Rococo was also greatly hastened by the tour of Italy made by the Marquis de Marigny in the early 1750s during which he inspected the Roman excavations of Pompeii and Herculaneum, which were largely responsible for inspiring a renewed interest in the Antique. Marigny was accompanied by the staunch traditionalists Jacques-Germain Soufflot, Charles-Nicolas Cochin, and the Abbé Le Blanc, and he returned to France to take up his position as Directeur-General of the Bâtiments du Roi violently opposed to the Rococo. In 1756, he addressed the Academy of Architecture, calling upon its members to "correct the poor taste that at present reigns in the field of decoration", and thus, the new *goût grec* was championed at the highest level. The anti-Rococo feeling appears to have come largely from intellectuals and the Academic establishment whose influence had been muted during the first half of the 18th century but who represented the continuation of the French architectural and artistic tradition formed during the previous century. For the majority of the social elite, ever hungry for new styles and diversion, the move from Rococo to Neo-Classicism was simply a matter of changing fashion.

Rococo Revival

The Rococo Revival, or "Ancient French" style as it was also sometimes called, was among the most popular of 19th-century furnishing styles. Although the style was scorned by design reformers, it came to prominence as an expression of apparent wealth rather than as evidence of correct taste. It originated in England, but its popularity soon spread, and examples of the style could be found all over the world from the 1820s right through to the 20th century. In fact, it was commercially the most successful style and perhaps represented the true nature of 19th-century design. It always remained a decorator style, and rarely found favour with progressive architects or designers.

The use of Rococo patterns and motifs in combination with French furniture and *boiseries* in an 18th-century style has also been seen as a reaction to the Empire and Directoire styles. By being expressly Bourbon in taste, the designs repudiated any

Napoleonic associations and could appear to refer to more certain times.

The Rococo Revival seems to have begun in England in the early part of the 19th century. Some collectors had become interested in objects from the French *ancien régime*, the availability and variety of which had been increased by the dispersal of French treasures during the Revolution. William Beckford and the Prince Regent both showed a taste for this style by collecting Boulle furniture and Sèvres porcelain. And when George IV became ensconced in Windsor and Buckingham Palace, he set about creating rooms in the "Old French Style", now known as the Rococo Revival. The State Reception Room at Windsor by Sir Jeffry Wyattville is one example. This lead was soon followed by others who were refashioning their interiors.

This aristocratic taste can be found in Belvoir Castle where Elizabeth, Duchess of Rutland chose the Louis XIV style which was used by her architect, Benjamin Dean Wyatt. A saloon was designed which incorporated *boiseries* from the château of Madame de Maintenon. The same architect worked in the identical idiom for the Marquis of Stafford, at Stafford House (now Lancaster House), London, in 1825 and 1826. In 1828 Wyatt designed the Waterloo Gallery for the Duke of Wellington's Apsley House in London.

Early Rococo Revival designs were characterised by a rather vigorous and sinuous curving which was in contrast to much 18th-century Rococo design. In fact, little attempt was made at accuracy, except at Wrest Park built by Thomas Philip, an amateur architect, between 1834 and 1839. Philip used correct sources for the exterior and slightly less accurate effects for the interior, which was supplied with reproduction Louis XV furniture.

The Rococo Revival was popularised in England by a range of promoters and by pattern book publishers in particular. These included Thomas King, who in 1829 produced *The Modern Style of Cabinet Work Exemplified* and John Claudius Loudon who recognised the Rococo as one of a number of suitable styles for interiors. When John Weale published reprints of the pattern books of Matthias Lock, Thomas Chippendale, and Thomas Johnson in the 1830s, the Rococo Revival was gathering pace. At first it was the comprehensive firms like Gillows who revived the style for furniture and interiors, adopting the famous C- and S-scrolls and acanthus motifs in the 1820s. Philip Hardwick's well-known white and gold fly chairs designed for Goldsmiths' Hall in 1834 are a classic example of the early revival.

The revival reached the mainstream when Henry Whitaker's *Practical Cabinet Maker and Upholsterer's Treasury of Designs* was published in 1847, soon followed by *The Cabinet Maker's Assistant* in 1853. Both volumes featured a range of Rococo Revival designs which could be adapted and manipulated to create a wide range of furniture designs. Even as late as 1864, Lorenzo Booth's *Original Designs for Decorative Furniture* had many examples of Rococo motifs.

Among many familiar motifs which are clearly derived from 18th-century Rococo work, two other details represent the Rococo Revival. The development of the familiar balloon-back shape, both for dining and easy chairs, came from the Louis XV panel-backed side chairs, but with the padding removed. When combined with cabriole legs, these remained a mainstay

of Victorian taste for many years. Alongside this development was the introduction of coil springing and deep buttoning which provided not only the comfort desired, but a change in the shape of the upholstery which adopted the swirls and curves of a Rococo idiom to the plush sumptuousness that was required of interior furnishings. In addition to drapery, quilting and stuffing, a varied range of upholstered furniture was devised including *crapauds*, sofas, *confidantes*, ottomans, bornes and *tête-à-têtes*. It is clear that the Rococo Revival was ideally suited to the "theatre" of the 19th-century saloon, drawing room and boudoir.

The Great Exhibition of 1851, held in London, revealed that work produced in the Rococo Revival was a predominant style among commercial manufacturers, and it also revealed that the Rococo Revival or the neo-Rococo style had developed into an international fashion.

"Le Style Pompadour" was trumpeted in with the Second Empire in 1851 which signalled a Rococo Revival in France. Public buildings and grand apartments such as the new Louvre, Chantilly palace, and some apartments at Fontainebleau were also refurbished with the new Rococo. It was not long before the style cascaded to the nouveau riche. As in England the influence of pattern books was important. For example, Théodore Pasquier's *Dessins d'ameublement* (1830s) was influential in promulgating upholstery designs, especially suites which were often of seven items: a sofa, two chairs and four side chairs. For the rest of the century Louis XV styles were copied for furniture and furnishings.

The Rococo Revival soon reached Germany where it was known as the *Zweites Rokoko*. Wilhelm Kimbel, a furniture-maker from Mainz, promoted the Rococo Revival from 1835 through three important pattern books, which were published in instalments, and included many Rococo Revival designs. A member of the same family, Anthony Kimbel emigrated to New York and was partly responsible for developing the Rococo Revival in America. During the 1840s another Mainz maker, Anton Bembé, was producing neo-Rococo furniture as well as designs for rooms and furnishing schemes. An amazing example of the Rococo Revival was made by Ludwig II of Bavaria who built Schloss Linderhof (1870–84) to the designs of Georg Dollmann. This confection was wildly elaborate and extreme. A later creation also in the Rococo Revival, the Schloss Herrenchiemsee (1878–86), was far more accurate in its reproduction of Rococo features. In 1880–95 the Royal Palace in Berlin was fitted out with neo-Rococo bedroom furniture by the firm of Zweiner.

The revival was adopted in Austria by Carl Leistler who, from 1842, supplied the Palais Liechtenstein in Vienna with Rococo Revival pieces, together with Thonet bentwood work in the same idiom. Bentwood was, of course, ideally suited to the curved forms required by the style.

In Russia the style took hold by the late 1840s. The Pink Drawing Room, and later the Gilt Drawing Room at the Winter Palace in St. Petersburg (1846–50) featured the newly fashionable interiors. As late as 1895, a neo-Rococo scheme was also used to furnish and decorate the private dining room in the same Winter Palace.

Although Italy supported a version of the Rococo Revival, the style never really found full favour there. The aristocracy, however, took to it, and many important interiors featured the

style. For example, the apartments in the Pitti palace in Florence which were occupied by Queen Margherita were redecorated in a Rococo style in 1860 and in the last years of the century the Quirinale Palace in Rome was given a completely Rococo Revival scheme for King Umberto.

It was in America that the interpretation of Rococo was developed to its fullest. The combination of a nouveau riche taste and available technology meant that American furniture in a Rococo Revival style would go further than its European counterparts. Furniture used the cabriole leg, C- and S-scrolls in great abundance and particular items became fashionable. *Etagères* were successful for display purposes and a range of sociables, love seats, and *tête-à-têtes* were manufactured in large quantities for American drawing rooms.

A number of well-known makers are associated with the Rococo Revival in America. In New York were the firms of Meeks, Roux and Belter; in Philadelphia, Henkels, Pabst, and Vollmer were among the top names. In New Orleans, there was François Seignoret, and in Cincinnati S.S. Johns. However, the most important exponent of the combination of style and technology was undoubtedly John Henry Belter.

Belter founded his firm in New York in 1844 and was widely successful in producing Rococo Revival furniture, using a patented lamination technique which allowed his furniture to be decorated with scrolls, curves, cut-through carving, and embellishment of all kinds. His success meant that his designs were soon copied by firms such as Charles Baudouine and Alexander Roux in New York.

Initially a style for the rich, with its lavish use of ornamentation, gilt carving and the need for collections of original French furniture, or at least copies from French originals, the Rococo Revival soon filtered down the social scale and became popular for bourgeois drawing rooms. This demand was fuelled by ignorant upholsterers who mixed periods and ended up with the so-called "tous les Louis" style. In these cases French-polished wood furniture, with some Rococo features, was made from mahogany, walnut and particularly burr walnut. These items were supplied for drawing rooms, rather than the more delicate and fanciful Rococo designs. The scope for ornament meant employment for a range of plasterers, papier-mâché suppliers (Bielefeld) and composition makers (George Jackson). No doubt it was these sorts of furniture and fittings that Robert Edis in his *Decoration and Furniture of Town Houses* (1881) complained about when looking back on the furnishings of a room in 1861: "the furniture of the stiffest kind ... propped up against the wall in straight lines so as not to over-task the bandy-curved legs which bore them ... an enormous glass over the miserably ugly fireplace in a still more enormous gold frame, with bits of plaster ornament, also gilt, stuck on like bats and rats on a barn door, and like them showing signs of decay and decomposition ...".

The Rococo Revival continued into the end of the 19th century and was partly absorbed by Art Nouveau and then found its own continuity in many 20th-century interiors. Furnishing firms such as Maples continued to offer "Meubles Louis XV et Louis XVI" well beyond World War I.

Rome, ancient

The ancient Romans' passion for embellishing the interiors of their houses, well documented in the ancient literature, stemmed from the fact that the house was not only a dwelling for the family and its dependents but that it was also a place for daily business. Unlike the classical Greeks, or even the Greeks of the Hellenistic period (327-31 BC), who conducted their business affairs in public spaces, the *domus* was the locus of a variety of activities ranging from the daily greeting of clients to special entertainments of peers to family religious rituals. Decorators took special care in appointing each space of the house with decoration suited to its uses. We know much more about the interiors of Roman houses than those of the Greeks because the eruption of Vesuvius in AD 79 preserved whole houses at Pompeii and Herculaneum, in Campania.

The systems for decorating the interior surfaces of the Roman house developed logically from the construction technique. Houses were built on a "slab" made of pounded earth and cement, and all the walls of a house, both exterior and interior, were made of stone and cement coated with plaster. Because there were few windows to the exterior, wall surfaces tended to be continuous and unbroken. Two basic approaches characterize the decoration of walls: the boundaries of each space could be emphasized as solid surfaces by sheathing them in real or painted imitations of precious colored marbles (the First Style), or they could be "opened up" with perspective schemes seeming to recede behind the physical boundary of the wall (Second Style). Similarly, the cement floors could either be decorated as flat surfaces, or elaborately framed illusionistic pictures could be set into them. Because Roman interior decoration used permanent materials (fresco on plaster walls and ceilings, stucco mouldings, and mosaic or cement floors), and because owners often took special pains to preserve rooms decorated in earlier styles ("period rooms"), scholars have

Rome: Ixion Room, House of the Vettii, Pompeii, 1st century AD

been able to chart with great accuracy the fashions in Roman interior design from 200 BC through AD 79.

The First Style covers the period 200–80 BC. One result of Pompeii's great prosperity during the second century BC was the elaborate decoration of several houses much larger than the palaces excavated in the Greek east. Decorators borrowed their vocabulary from palaces and basilicas to create grandiose interiors. Using inexpensive plaster and paint, they imitated costly marble masonry, thereby introducing into the private house the wealth and status associated with palace and temple. The "illusion" in the First Style is a rather literal one; like faux-marble techniques used to this day, it succeeds if the viewer is fooled into believing that painted plaster walls are really constructed in or sheathed with precious marbles. Rather than being work for painters, the First Style was carried out by stuccoists, skilled in applying and carving plaster to make the fluted pilasters, mouldings, and capitals that substituted for ones sculpted from marble. These architectural elements formed the basis of the credibility of the First-Style schemes: the successive rows of marble blocks and mouldings of the wall's socle, middle zone, and upper zone were framed by pilasters and capitals placed at doorways and openings to

rooms. All of these elements received the colors of bright and expensive marbles and were carved and modeled with the same mouldings found in masonry. The First Style, then, is really a plaster cast of architectural forms.

Most First-Style houses received simple red or black cement pavements decorated with geometric designs outlined in rows of cubic stones (*tesserae*). Their all-over designs imitated carpets in both their compositions and their placement within rooms. In the latest phase of the First Style, however, designers often inserted illusionistic pictures into the floors. These pictures were prefabricated in a workshop using extremely small colored *tesserae* (1–5 mm), specially shaped and arranged to imitate the individual brushstrokes of a painting. Executed by specialists on marble or terracotta trays, these paintings in stone were portable. Called *emblemata*, or insets, they would be chosen by the patron and carried to the site for installation into the usual mosaic floor worked in much larger, uniform cubic *tesserae* (0.5–1.0 cm). Whereas the geometric pavements in red or black cement made few demands on the viewer, use of illusionistic *emblemata* created curious problems. The mosaic picture-insets on floors required a certain suspension of disbelief – particularly because they could be

walked on. They constituted an illusionistic “hole” in the flat surface underfoot.

The Second Style was prevalent between 80 and 20 BC. Unlike the First Style’s structural decoration, where imitation marble blocks articulate all wall surfaces, with special framing elements at openings, the Second Style uses columns painted in perspective that appear to hold up the ceiling. By spacing these columns regularly around the walls of a room, the painter created a kind of colonnaded pavilion; often the viewer sees landscapes or architectural prospects opening up “behind” the wall. In the early Second Style (80–60 BC), these colonnades wrap around all four walls of a room, with only one vanishing point at the center of the back wall. In the mature Second Style (60–40 BC), the painters placed greater emphasis on the views opening up behind the colonnade than on the continuity of the colonnade itself. With the late Second Style (40–20 BC) they introduced the *aedicula*, a shallow temple-front that frames a painting in the center of each wall. Thus over this sixty-year period artists went from the conceit of the colonnaded pavilion from which the viewer could look out to that of the picture gallery (*pinacotheca*), intent on presenting the viewer with imitations of “masterpiece” paintings framed by the *aediculae*.

The Second-Style painter had to have an excellent knowledge of perspective, the ability to create convincing lighting effects, and a full repertory of still-life subjects to decorate these *trompe-l’oeil* architectural fantasies. Scholars believe that the Second Style got its impetus and subject matter from theatrical scene painting. Second Style rooms encouraged the viewer to stand at a point in the room’s center to enjoy the illusion of the whole and the symmetry of its construction; painters always made the perspectives of right and left walls mirror each other, changing only minor features that appeared on illusionistic ledges, such as representations of theatrical masks, exotic birds, or fruit still lifes.

Central to the success of the Second-Style room was the coordination of painting, stucco, and mosaic work. A bedroom in the Villa of the Mysteries provides a clear picture of how wall painter, stuccoist, and mosaicist coordinated their skills to differentiate areas with separate functions within the same space. A mosaic carpet with a pattern of red and black crosses defines the circulation space of the anteroom. Two contrasting bedside carpet mosaics meet at right angles by the closet, separating the two alcoves that housed the beds (*lecti*, see below). They coordinate closely with the scheme of the wall painting, where a red and green pilaster folded around the outside corner of the closet meets them. The pilasters end in elaborate stucco capitals. Each alcove has a different stucco pattern in its vaulted ceiling. Such functional division employing wall, floor, and ceiling decoration also occurs in dining rooms (*triclinia*), where decoration differentiates the space for the dining couches from that for the servers.

If the Second Style allowed the owner to revel in the luxury of exciting, colorful – and somewhat invasive – theatrical backdrops in his house, the Third Style (20 BC–AD 45) signaled a much simpler and more sober attitude toward interior decoration. The Second Style had already reduced its demands on the viewer by abandoning wrap-around perspectives in favor of the *aedicula* in the center of each wall. The late Second-Style emphasis on the big picture within the *aedicula* gave the viewer a single focus on each wall, emphasizing the autonomy of each

wall’s perspective system. With the Third Style, one has to search for an indication of architectural members because the painter has made every element in the scheme miniature. This reduction to utter flatness of the substantial architecture and daring, deep perspectives of the Second Style emphasizes the wall as a spatial limit rather than one that opens up through illusions of perspective. The viewer, rather than standing in the middle of the room to grasp the over-all perspective effect, now comes up close to individual parts of the wall to appreciate the artist’s miniatures, whether they be intricate architectural decoration, little Egyptian friezes, or delicate landscape vignettes. The painter regularly divides the wall in three horizontal bands, corresponding to the positions of his scaffolding as he paints the wall from the top down (traditionally called the upper zone, the median zone, and the socle). He also employs a tripartite scheme for the walls’ vertical divisions, with a larger panel in the center of the wall flanked by two thinner panels. In important rooms the central division will feature a picture framed by an *aedicula*.

In the tablinum of the House of Lucretius Fronto this scheme achieves great sophistication. The upper zone features a highly stylized representation of the stage front, or *scaenae frons*, of the theater, consisting of *aediculae* arranged symmetrically on a shallow platform. The median zone presents a fancy central picture of Mars and Venus with little landscapes on ornate easels in the flanking panels. This *tablinum* boasts an intermediate zone, traditionally called the *predella*, that features a miniature frieze. Finally, the painter has decorated the black socle with the image of an enclosed formal garden.

The new techniques and decorative motifs that begin to appear in mosaics around 20 BC parallel the changes in taste that occur in wall painting. Both polychromy and the three-dimensional decorative motifs it served disappear in favor of flat black-and-white designs. Third-Style pavements, like the frescoed walls, avoid representation of depth; instead of the colored and shaded *trompe-l’oeil* meanders and cubes in perspective which begged the question of the floor’s flatness, Third- (and Fourth-) Style mosaics are emphatically two-dimensional.

The Fourth Style covers the period AD 45–79 but instead of constructing temporally successive phases, recent scholarship has favored dividing the Fourth Style into decorative “manners” with coherent diagnostic characteristics. The Tapestry Manner employs the motif of the hanging carpet with carefully executed borders, called “carpet” or filigree” borders. Flying figures or pictures decorate the centers of these tapestries. They often hang from large candelabra or from thin, multistoreyed pavilions that create a perspectival slot behind them. Sometimes the tapestries effect startling contrasts with their large fields of red and gold or light blue and black. As in the Third Style, central pictures abound, with a preference for brightly colored scenes representing dramatic moments in mythological or heroic cycles.

The Tapestry Manner represents a new decorative conceit that held great appeal for patrons tiring of the chilly rigors of the flat, miniaturistic Third Style. It offered greater variety in the treatment of the flat wall, with perspective views to either side of the taut tapestries interrupting the walls’ flatness. The Tapestry Manner introduced a compromise for the viewer not available in Third-Style schemes, where one had the choice of

either a synthetic view of the whole wall or a close-up, analytic view of its details. Now the viewer could enjoy the walls in sectors defined by the stacked pavilions between tapestries.

The Plain Manner, used in less important rooms of the house, emphasizes the wall's flatness by dividing it geometrically into a patchwork of color panels arranged horizontally and vertically. In place of the perspective slots of the Tapestry Manner are conventionalized ornaments like candelabra and incense burners. The Plain Manner activates the wall by juxtaposing the colored panels themselves, in white, black, bright red, and porphyry red.

The Tapestry Manner and the Plain Manner seem quite tame compared to the exuberant Theatrical Manner. Its salient characteristic is the *scaenae frons*, or stage front. Unlike the flat representations that occur in the upper zone of some Third-Style walls, the Fourth Style *scaenae frons* can take over all three zones of the wall, with the socle a podium surmounted by a median zone composed of adjacent, stacked *aediculae*, topped by yet another stage front in the upper zone. Such compositions occur frequently in Nero's Golden House (AD 64–68). In other Theatrical Manner decoration only the upper zone features the *scaenae frons*, with central pictures dominating the median zone. The Theatrical Manner converts the flat wall into a kind of slotted screen in which each *aedicula* or opening frames a limited perspective view, often suffused with a hazy white light. Upper zones tend to be evanescent and airy, rendered in indistinct whites, golds, and grays. Theatrical too are the figures descending staircases within these stage fronts. Despite the Theatrical Manner's delight in architectural illusionism, it does not signal a full-fledged return to the Second Style. Whereas the Second Style depended on making the viewer believe that its fictive columns supported the ceiling, the Theatrical Manner's architecture supports nothing. Views through the stage front's *aediculae* provide local spatial release; they are not extensive enough to induce the viewer to believe that he is standing in a portico looking out at the landscape or into a sanctuary. Assertively flat decoration interspersed among the *aediculae* – such as central pictures, stretched tapestries with flying figures, monochrome panels, and faux-marble socles – keep returning the viewer to the wall as a spatial limit. If anything, the Theatrical Manner signals an eclectic summation of elements of all previous styles, from the imitation marbles of the First Style to the architectural conceits of the Second to the miniaturism and central *aedicular* pictures of the Third.

As with the Tapestry Manner, there is no single viewing station in the Theatrical Manner; the proliferation of points of interest entices the viewer into examining the entire wall, feature by feature. While the *scaenae frons* serves as an armature to give the figural and decorative elements logical slots, and symmetrical repetition of color and motifs balances the visual field, the effect is one of an all-over pattern rather than one with a single focus of interest. When combined with important central pictures, as in the Ixion room of the House of the Vettii, the viewer comprehends the wall painting in two stages. He first identifies the meanings of the central pictures. Next, he takes in the imagery arranged in sectors in the uniformly activated wall surfaces. This “something for everyone” approach oversteps the boundaries of restraint and miniature of the Third Style yet provides much more latitude

in choice of subjects than the standard sacred groves and temple precincts of the Second. The Theatrical Manner's all-over pattern evolves into the panel styles typical of the Second and early Third centuries.

For the ancient Roman, furniture was as integral to the overall decoration of the house as its wall paintings and statuary. Often considered as a continuation of the styles and forms developed by the Greeks, the furniture of the Roman household responded, as did that of the Greeks, to the dictates of functionality. However, the Romans' interest in decoration apparent in the majority of their art forms carries over to their elaboration of the Greek and Hellenistic designs they inherited. Thus, unlike their Greek predecessors, Roman designs tended toward the Baroque, exhibiting a richness of design that no doubt complemented their fancifully painted walls and ornate floor mosaics.

Romans also showed special concern for the arrangement of their furniture. In dining rooms, for example, the pattern of the mosaic floor often indicates the placement of the dining couches; similarly, bedside carpet designs in bedrooms mark off the margins of the spaces for the beds. Often Roman designers also used contrasting painting motifs on the walls and ceilings to carry this differentiation of the space for furniture from floor to ceiling. Such careful planning demonstrates the Roman concern for an interior decoration with all its elements – painting, mosaic, and furniture – harmonized.

The Romans used fine woods, metals, and stone to construct their furniture. They designed many pieces for greater portability than is general today. Lighter frames for beds and chairs allowed easy movement of pieces from one room to another, since the ancient Roman home was not so full of furniture as a typical 20th-century home. Often a piece, such as a sleeping couch (*lectus*) could be used in a variety of spaces. The Roman aristocrat, whose house had many rooms suitable for dining or reception, would have servants move furniture to take advantage of the particular decoration or views from this room or that.

The history and appearance of Roman furniture is documented in a variety of sources. The charred or carbonized remains of furniture have been found in many of the houses destroyed by the eruption of Vesuvius in AD 79. In addition, artists sometimes depicted furniture in wall paintings and mosaics. Other sources include ancient texts, funerary monuments, such as tomb markers, altars and sarcophagi, and terracotta wall plaques.

An especially touching visual source for furniture is a Roman sarcophagus now in the Museum in Leiden. The sculptor carved the interior of this stone coffin to represent a home and its furnishings, complete with couch, chairs, table, chest, shelves, a sideboard, and clay vessels. The furniture is representative of the basic types of furnishings one would have found in the Roman house. Since for the ancient Roman the tomb was his home after death, its decoration must have reflected his ideas of proper interior furnishings.

A small room in the House of the Carbonized Furniture at Herculaneum contained the remains of a small three-legged table and an unusually elaborate bed frame. The carver made the ends of the curved table legs into the heads of greyhounds. Other examples of furniture recovered from excavations in the Vesuvian area include lamp stands, chests, shelves, large

marble tables, and chairs, often found where the occupants left them at the time of the eruption.

To date the best source for information on the furniture of the ancient West is Gisela Richter's *Furniture of the Greeks, Etruscans and Romans* (1966), presenting 668 images. Numerous types of chairs, called *cathedrae* or *solii*, appear repeatedly in the visual sources. The most common form is much like our four-legged dining chair, with a back. Its legs were often turned, and the seats appear to have been covered with cushions. On occasion one finds representations of *cathedrae* accompanied by a footstool, a *scamnum* or *suppedarium*. The Roman poets Martial (*Epigram* III, 63, 7) and Horace (*Satires* I, 10, 90–91) both suggest that Romans considered *cathedrae* to be women's chairs. The Romans may have associated women with these types of chairs because of the nature of their domestic work, which included weaving and spinning of wools, probably done where light was best at different times of day, thus necessitating the portability of a light-framed chair.

The *lectus*, a bed or couch, was a common piece of furniture used both for dining and for sleeping. *Lecti* had four legs, usually turned, supporting a horizontal frame that held a stuffed mattress. Rising from its short ends (usually both, but sometimes only on one end) were its *fulcra* – flanking projections much like head- and footboards on modern beds. *Lecti* were often the most precious furnishings in the household. Later developments in the form of the *lectus* included the addition of a solid back. The 5th-century AD manuscript of Vergil's *Aeneid* includes an image of Dido before her suicide, reclining on a *lectus* with a tall back. In this same image one can find a small step ladder reaching up to the bed for easier access. Indeed, it seems that some *lecti* were too high to be mounted without the aid of a small stool or ladder. Archaeologists have often found *lecti* in the rooms that opened onto the atrium, suggesting that some of these rooms were used as bedrooms, or *cubicula*. Sometimes the architect created separate alcoves for the *lectus* or made indentations in the walls to accommodate its frame.

The U-shaped dining room or *triclinium* got its name because its principal furniture consisted of three *lecti* (*klinai* in Greek) arranged at right angles around its perimeter. Roman custom designated each couch according to its position: the one on the right rear wall the upper couch (*summus*), that against the rear wall the middle (*medius*), and the one against the left rear wall the lower (*imus*). Each guest's place at table indicated his or her status; the most important guest reclined on the left-hand side of the middle couch (*imus in medio*). Servants placed food and drink on one or more low tables within the diners' reach.

Richter has counted five types of tables from the Roman period: rectangular with three legs, rectangular with four legs, round with three legs, round with a single supporting leg, and rectangular with transverse supports. This last type, probably called a *cartibulum*, that is, a table for books and tablets, is usually marble and is often found in the atrium near its main reception space, the *tablinum*. The *cartibulum* also appears in gardens. Small three- and four-legged tables (*mensae*) with raised edges around their table tops, generally made of bronze or wood, often had elaborately carved or cast legs in the forms of animal paws or hooves.

Chests (*arcae*, *cistae*), cupboards (*armaria*), and sideboards

(*abaci*) were the main storage units in the Roman house. Archaeologists have found *arcae* cemented into the walls of the atrium secured with bronze fittings and locks. They contained the household valuables. *Armaria*, probably adapted from the preceding Hellenistic era, became very popular with the Romans (Richter, p. 115). The Leiden sarcophagus includes a representation of such a cupboard, used to contain anything from textiles to books to family votive figurines. A cupboard found in the House of the Wooden Shrine at Herculaneum served as both a storage space and a household shrine (*lararium*). The lower two-thirds of this cupboard had shelves protected by double-batten doors, while the upper third took the form of a small temple with double Corinthian columns.

The *abacus* was a third type of storage unit for the Roman house. Although little is known about its form, Richter has suggested that it was something of a combination of table and chest; she notes that the piece of furniture in the Leiden sarcophagus with double shelves supporting ceramic vessels may have been an *abacus* (Richter, p. 116).

The Romans appreciated and demanded beautiful workmanship and decoration on their furniture. The characteristically intricate carving of wood and stone, as well as the carefully cast bronze fittings, reveals their taste. Like their Greek predecessors, the ancient Romans displayed a keen interest in animal forms for decorating their furniture. Dog and horse heads were particularly popular forms for the finials that rose from the *fulcra* on elaborate dining couches (*lecti*) or for the feet of tables. Mythological animals, such as griffins, enjoyed great popularity. Finials also took anthropomorphic forms; it is not uncommon to find divinities like satyrs and maenads (companions of Dionysus) on the *fulcra* of dining couches – appropriate for furniture that would be used at a wine-drinking feast.

Like the references to the god of wine on the dining couch, apotropaic or prophylactic devices in furniture reveal the Romans' religious and superstitious beliefs. Because they believed that the phallus warded away evil, patrons bought tables with legs that figured hermaphrodites with sexual organs exposed or ithyphallic males; these would protect the diner from potential illness at table (Marcadé, p. 28).

Pliny the Elder, author of the 1st-century AD *Natural History*, describes in book XVI, 233, the Roman desire for exotic woods, such as citron and maple, as well as a love for fine workmanship, like veneering, inlay, and fine metal plating. A reconstructed *lectus* now at the Metropolitan Museum of Art in New York, worked in bone and colored glass inlay, exemplifies this Roman love of expensive and elaborate ornament. The Romans further embellished their furniture with pillows, leather skins (especially sheep), and elaborate woven fabrics, most commonly made from wool and linens, but also occasionally silk (Richter, p. 117). Unfortunately these have survived only in painted representations.

Room Dividers

Room dividers developed during the mid-20th century as a direct response to open planning. During the 1920s and 1930s, when open planning was first introduced into Modernist interiors, sliding doors or folding concertina screens were discreetly installed where partition walls would once have stood, so that the newly-created large open plan living room / dining room area could, at times, be broken down into smaller units. The middle classes in Europe still maintained a relatively formal lifestyle during the inter-war years, and the screen-type room divider was considered necessary in order to preserve some of the social conventions of the old order. At this date even the most progressive architects were conscious that their clients might feel uncomfortable and rather exposed at meal-times eating in full view of the living room. The temporary screen device created a smaller and more intimate space in which to serve food, without destroying or seriously compromising the architectural grandeur of the spacious new open plan interior.

By the end of World War II, however, life had changed irrevocably and the old order had largely been swept away. Lifestyles became increasingly informal and even in the houses of the wealthy middle classes it was unusual to find live-in servants. By the mid-1940s open planning was beginning to be accepted as standard in new houses, especially those designed in the "Contemporary" style, the revised post-war version of Modernism. Furthermore, open planning was now extended to

encompass not only the living room and dining room but the kitchen as well. In many American houses of the late 1940s and 1950s, all three rooms were swept into one. As open planning began to seem less unusual and people became accustomed to living in larger and more open rooms, the need for screen-type divisions seemed less important, and they were installed less commonly. Room dividers lived on, but in a modified form: the new invention of the early post-war era was the room divider as a piece of furniture.

The post-war room divider was no longer merely a placebo; it was intended to serve a useful and practical role within the room. "Contemporary" room dividers were freestanding units composed of a combination of open and closed storage in the form of cupboards and shelves. They were often modular in design so that they could be arranged in a variety of different flexible combinations, and they were usually constructed from a framework of metal bars or poles, with shelves or cupboards positioned in between. They replaced the old-fashioned bulky sideboard which used to stand against the dining room wall, but which by the 1950s had become something of a dinosaur in the smaller, more compact post-war home. Room dividers were physically lighter than sideboards, and being partly open structures, they did not obscure the light or obstruct the room. They were well-organised structurally and, unlike sideboards, they were intended to deter rather than to encourage clutter. Many did have a display component, and sometimes, as in the case of the plant trough room divider, display was their primary function, but in most cases the main purpose of the unit was to provide storage.

Adopted in a variety of open-plan interiors during the 1950s, and suitable for both the workplace and the home, room dividers were multi-functional and were used both to indicate boundaries and to provide valuable storage and display space. It could be argued that the emergence of the room divider signified an admission of failure on the part of "Contemporary" architects: interior walls were abolished but in their place came room dividers to mark the line where a wall would once have stood. No doubt an element of security and reassurance was still involved, but the room divider was now above all a practical and functional item of furniture, the primary role of which was storage.

In the home the most common location for room dividers was either in between the kitchen and the dining area, or in between the dining and recreational areas of the living room. When all three rooms were combined into one, a variety of room dividers might be employed to screen the different activities taking place in each area. Although there were obvious benefits in adopting open planning, such as making what would otherwise appear a relatively small interior look larger, and being able to maximise the use of limited space, human conditioning was not easily shed. A room divider was the compromise solution: it served as a physical marker of different territories, but it did not act as a barrier to communication and movement. Room dividers located in between the kitchen and dining area became particularly popular during the 1950s, and it was out of these structures that the concept of the breakfast bar developed. As well as providing a perch where snacks could be eaten, the kitchen / dining room divider enabled food to be passed directly through from the place of preparation to the place of eating without being carried through doors and

Room Dividers: Comprehensive Storage System (CSS) by George Nelson for Herman Miller, 1959

corridors, while the implements and accessories required at mealtimes were stored close at hand in the cupboards of the unit. Such cupboards were usually designed to open on both sides, thus facilitating the process of retrieving crockery and cutlery at mealtimes and putting it away again after it had been washed. One further social advantage of this type of room divider was that it meant that the housewife was not isolated from the rest of the family or her guests: she could converse freely while preparing the meal, and she could also watch over the children while they were playing in the nearby living room without having them under her feet. There were many reasons, therefore, why the "Contemporary" room divider was a success.

Room dividers located between the dining and relaxation areas of a main living room, although still largely functional, often served a decorative purpose as well, providing shelf space for ornaments and, when decorated with coloured or patterned panels as they often were, enlivening the interior. For example, brightly coloured monochrome panels or sheets of abstract patterned formica were often to be found on cupboard doors and tops. As well as incorporating regular cupboards and bookshelves, living room dividers often had built-in fold-down desk flaps or purpose-designed storage space for radio, television or hi-fi equipment. Such features were considered particularly important at this date because of the growing interest in electrical gadgetry. Domestic appliances such as record players and television sets were becoming common during the 1950s, and it was recognised that new and more flexible forms of furniture were needed to house them. The room divider took on this role.

The challenge of the room divider attracted the attention of many leading architects and designers of the day, including Jean Prouvé in France, Charles Eames in the USA and Robin Day in Britain. An important influence on the designs of all these post-war designers was the pioneering work of Le Corbusier during the mid-1920s in the development of his modular *Casiers Standard* storage cabinets. The designer most closely associated with the development and refinement of the "Contemporary" room divider was George Nelson, Design Director at the American furniture company, Herman Miller, from 1946. Nelson came up with the concept of a modular *Storagewall* system as early as 1945. This led to the launch of his *Basic Storage Components* for Herman Miller in 1949, a set of bench-like stands and box-like cupboards which could be stacked together in various arrangements, and which included optional components such as drawers, sliding doors and speaker panels. The final version of the *Storagewall* concept was the *Comprehensive Storage System (CSS)* manufactured by Herman Miller from 1959 until 1973. This system, which comprised 22 different basic components, could be purchased flat-packed and then suspended from adjustable aluminium poles sprung between the ceiling and floor. The CSS could either be set directly against a wall, or, with additional poles in place, it could be erected as a freestanding structure in the centre of a room. Highly adaptable, it could be used in a purely functional capacity as office, study or workshop equipment; it could also serve as kitchen or dining room storage; and it looked equally comfortable and elegant in a living room setting as the housing for a music centre or ornaments. Most importantly, being modular, it could be built up to whatever

size or scale the owner desired and in a variety of physical arrangements.

The room divider had its heyday during the 1950s and 1960s when domestic open planning was widely adopted in both new and converted old houses. When open planning began to go out of fashion in the 1970s, however, the demand for room dividers declined and they have since become virtually extinct, except in offices where open planning is still widespread today. Room dividers are now associated almost exclusively with office furniture, and are no longer considered suitable for the average home, where they have been replaced by cheap flat-packed bookcases and purpose-designed stands for hi-fi and video equipment.

Rose Family fl.1750-1799

British stuccoists

For much of the 17th and 18th centuries, decorative plaster and stucco work formed an integral part of the decorations in stylish public and domestic interiors, but from the first quarter of the 19th century its popularity began to wane. The shifting fortunes of the Rose family of plasterers reflects this pattern of popularity and decline. The firm enjoyed its greatest success during the second half of the 18th century partly due to the adroit management of Joseph Rose Jr., and also because of its partnership with Robert Adam. The connection with Adam meant that the Rose family became synonymous with the highest standards of workmanship and with plasterwork executed in the Neo-Classical style, and for as long as this style dominated interior design, the Rose family maintained its unrivalled position as the leaders in their field.

Generally speaking, the advent of Neo-Classicism saw a move away from the monumental, high relief plasterwork characteristic of the Baroque and neo-Palladian styles and from the combination of sculptural and free-flowing organic forms which was the result of the English flirtation with Rococo. Examples of Baroque plasterwork can be seen in work executed by James Pettifer and Robert Bradbury (both of whom worked at Sudbury Hall, Derbyshire, 1765), and George Goodgeon. A superb example of Palladian Classicism survives in Thomas Clark's plasterwork in the hall at Holkham (c.1760). The Rococo style was perfected by Swiss and Italian craftsmen such as Giuseppe Artari and Giovanni Bagutti at St. Martin-in-the-Fields, London, and the Octagon Room, Twickenham, both designed by James Gibbs; Francesco

Vassalli, who worked at Towneley Hall, Lancashire; and Giuseppe Cortese at Studley Royal and Gilling Castle, both in Yorkshire. Native plasterers such as William Wilton and John Whitehead produced a version of Rococo that synthesised the influence of the Italian stuccoists with designs from predominantly French sources such as pattern books by De La Cour and Parisian engravings by Blondel and Huquier. The elder Joseph Rose executed several interiors (initially with Thomas Perritt) for the architect James Paine in a less Gallic and subsequently less flamboyant Rococo style; these included Doncaster Mansion House (late 1740s), Nostell Priory (late 1740s–early 1750s), and Felbrigg Hall (1752). His design and execution of the plasterwork in the Drawing Room at Heath Hall, Yorkshire (1758), for the architect John Carr, reveals his familiarity and confidence with this quintessentially English interpretation of Rococo.

The excavation of ancient Roman towns and the opening up of Greece to the West during the second half of the 18th century brought fresh impetus and direction to the interest in all things classical. Despite the inevitable faddism of “chic antique” there was a genuine desire among many architects and patrons to create interiors based upon detailed archaeological research. Plasterwork, particularly within the interiors of Robert Adam and James Wyatt, became more subtle, with greater emphasis upon geometric designs and lower relief. The domination of the Rose family during this period is partly explained by the death or departure from England of the country’s few remaining Italian stuccoists. In addition, the Adam brothers held a virtual monopoly on the use of various popular plaster compositions. They had acquired the rights for the famous Liardet composition (patented 1773) and successfully challenged the right of other architects to use this composition in a case brought against John Johnson in 1778. As a result they practically cornered the market in the production of stock Neo-Classical details and their favoured plasterers prospered accordingly.

Although the Rose firm dominated the Adam brothers’ commissions, they were astute enough not to restrict their allegiance and activities to one architectural practice. They worked for other premier architects of the day, such as William Chambers (Amptill, Bedfordshire) and James Wyatt (Chislecoote, Ireland, and Heaton Hall, Manchester). However, it seems that the family’s close identification with the Neo-Classical style, and perhaps a reluctance to abandon what had been a winning formula, meant that they were not the obvious choice for commissions in other styles that were becoming increasingly popular in the late 18th and early 19th century. James Wyatt, for example, used Francesco Bernasconi in preference to the Rose family for his Gothic interiors, despite the fact that he frequently employed them on other commissions and that the family had executed Gothic-style plasterwork for Adam at Hune Priory, Northumberland (1778).

It was for their work for Robert Adam that the family were most famed, and in the majority of cases they executed his designs with little or no change. But, if the originality and conception of the interior can be attributed to Adam, the dexterity and skill behind the rendering belongs to Joseph Rose Jr. and his craftsmen. Adam’s description of the Library ceiling at Kenwood is instructive in laying down the general principle

for his use of coloured plasterwork as executed by the Rose firm: “the ground of the panel and freeses are coloured with light tints of pink and green [actually blue], so as to take off the glare of white, so common in every ceiling till late. This always appeared to me so cold and unfinished, that I ventured to introduce this variety of grounds, at once to relieve the ornaments, remove the crudeness of the white, and create a harmony between the ceiling and the sidewalls, with their hangings, pictures, and other decorations” (Bryant, 1993). In addition, Joseph Rose Jr. directed work on the plasterwork at Bowood, Wiltshire, Croome Court, Worcestershire, Harewood House, Yorkshire, Kedleston, Derbyshire, Northumberland House and numerous other of Adam’s major buildings. Rose plasterers working at Audley End, Essex during the redecoration of rooms by Adam between 1762 and 1797 were also involved in the plaster decoration of the garden monuments (the Grecian Temple, 1774, and the Temple of Concord, c.1790).

By the 19th century, the use of plaster and stucco within interiors had declined. The first challenge came by way of cheaper materials such as papier-mâché and machine-stamped composition ornament. In addition, the development of fire-proof cements that dried quickly and, unlike plaster, did not crack or swell, increasingly usurped plaster and stucco in all but figure modelling. Perhaps more significant was the growing acceptance of the new principles espoused most forcefully by the Gothic Revival architect A.W.N. Pugin. Publications such as Pugin’s *True Principles* (1841) called for a return to integrity and honesty in the use of building materials and by extension outlawed faux architecture. Plasterwork that aped medieval stone tracery and fan vaulting, as, for example, at Strawberry Hill, was strongly criticised. A fleeting interest in plasterwork was shown by the late 19th century “Revival” styles.

JACQUELINE RIDING

Joseph Rose, Sr. Born in Yorkshire, c.1723, the son of the plasterer Jacob Rose. Apprenticed to Thomas Perritt of York (1710–59), 1738–45. Active as a plasterer in Doncaster, York, from 1752; collaborated with his brother, Jonathan (died after 1780), and after 1760 with his nephews Joseph and Jonathan. Worked primarily for Robert Adam from 1760. Died in Carshalton, Surrey, 11 September 1780. Left his business to Joseph Rose, Jr..

Joseph Rose, Jr. Born in Norton, Derbyshire, 5 April 1745, the son of Jonathan Rose and nephew of Joseph Rose, Sr. Trained by his uncle and visited Italy in 1768. Married Mary Richmond in 1774. Worked for the family firm of Joseph Rose & Co.; appointed Master of the Worshipful Company of Plasterers, 1775; succeeded to the business on his uncle’s death in 1780. Died 11 February 1799.

Selected Works

A sketchbook containing 331 friezes by Joseph Rose is in the library, Royal Institute of British Architects, London. Additional sketchbooks by Joseph Rose are at Harewood House, and Sledmere, Yorkshire.

Interiors

- 1741–47 Temple Newsam House, Leeds (plasterwork for interiors; Joseph Rose, Sr.)
- 1751–63 Wentworth Woodhouse, Yorkshire (plasterwork including the great hall, dining room and drawing room; Joseph Rose, Sr. and Joseph Rose, Jr.)

- 1752 Cusworth Hall, Yorkshire (plasterwork for interiors; Joseph Rose, Sr.; building by J. Paine)
- 1761–63 Shardeloes, Buckinghamshire (plasterwork for interiors; building by R. Adam)
- c.1763–64 Bowood, Wiltshire (plasterwork including the, entrance hall, gallery, dining room, cube room, King's room, and corridors; building by R. Adam)
- 1765–70 Harewood House, Yorkshire (plasterwork including the dining room, dressing room, music room, library, salon, bedrooms and gallery): Edward Lascelles
- 1766 Mersham Le Hatch, Kent (plasterwork including the drawing room, dining room, and other principal rooms; building by R. Adam): Edward Knatchbull
- 1766–77 Nostell Priory, Yorkshire (plasterwork for interiors; building by R. Adam): Sir Rowland Winn
- c.1772 Kenwood, Middlesex (plasterwork for interiors):
- c.1775 Kedleston, Derbyshire (plasterwork including the music room, drawing room, library, portico, hall, saloon and dining room; building by R. Adam): Lord Scarsdale
- 1792–97 Castlecoole, Co. Fermanagh, Northern Ireland (plasterwork ceilings; building by J. Wyatt): 1st Viscount Belmore

Rossi, Karl 1775–1849

Russian architect

The work of Karl Rossi marked the culmination of the great period of Classicism in Russia. His creative period began after Russia's victory in the Napoleonic wars and during the final decade of Alexander I's reign and the early years of Nikolai I's rule (mid 1810s to early 1830s) he was Russia's leading architect and exponent of the late Neo-Classical or Empire style. Active mainly in St. Petersburg, he was involved in a wide range of activities. He built grand ensembles, public and

administrative buildings, palaces and park pavilions, decorated state interiors and designed suites of furniture and numerous *objets d'art*. He was known principally as the consummate master of the architectural ensemble, and his greatest skill lay in the organising of large spaces.

The ceremonial and monumental buildings which he designed for the squares of St. Petersburg, enriched with allegorical sculptures, became the apotheosis and consummation of the Russian Empire style. They symbolized the pathos of the might of the Russian Empire and Rossi's own proud ambition to "surpass everything that the Europeans might create". The same ceremonial and monumental qualities, together with a high sense of decoration and refinement, are to be found in Rossi's interiors, where he not only worked out the overall structure, but was also responsible for the entire decor right down to the smallest of details and all the furnishings. Rossi saw his interiors in terms of a synthesis of the arts. The sculptors V.I. Demut-Malinovsky and S.S. Pimenov, the artists D.-B. and P. Skotti, A. Vighi and B. Medici, the Dadonov brothers, T. Dylev, N. and S. Sayiagin and the Tarasov engravers all worked permanently under Rossi's leadership. Taking the musical analogy, Rossi was able to achieve a single polyphonic sound from all the performers through his own role as virtuoso conductor.

Rossi began work in the 1790s under the guidance of his tutor Vincenzo Brenna and he participated in the decoration of the interiors of the palaces at Pavlovsk and Gatchina, and of the Mikhailovsky Castle – the St. Petersburg residence of Paul I. From Brenna he inherited a devotion to interiors saturated with decoration, and to the extensive use of the sculptural relief and military motifs, which both became integral features of the Empire style.

Rossi's first significant independent commission was his reconstruction of the Prince of Oldenburg's palace in Tver (1809) where he built magnificent state rooms, using his own designs for furniture and decorative objects (these have not survived). He subsequently worked as an artist and craftsman at the Imperial porcelain and glass works in St. Petersburg from 1814 to 1819. And from the mid 1810s, he was a leading figure in the massive and intensive programme of building in St. Petersburg where, with characteristic versatility, he was simultaneously able to supervise the planning and the actual building work and complete the interior design and furnishings.

For ten years from 1817, Rossi worked on the interiors of palaces belonging to the Imperial family. As part of the reconstruction of the Anichkov palace (from 1817), he redecorated a number of state rooms where decorative methods that Rossi frequently returned to in subsequent projects were used for the first time – the walls were decorated with artificial marble and covered with fabrics and allegorical and decorative paintings. Of the interiors which Rossi completed for the palace at Pavlovsk, the library stands out in particular (1822–24). Its bow shape was determined by the fact that it was added onto a curved wing of the palace and it is beautifully lit by large arched windows. The austere and elegant furnishings and the grisaille paintings in the vault create an atmosphere that is at one and the same time elevated and workmanlike.

Rossi's most notable contribution as an interior designer was in the Elagin palace built in 1818–22 for the widowed

Empress Maria Fedorovna, the mother of Alexander I. The precise and compact design for the palace consisted of a series of rectangular, en suite state rooms. The tall Oval Hall, built along the axis of the palace, contrasted with the other rooms (the Oval Hall in the Mikhailovsky Castle was probably the direct prototype for its namesake in the Elagin palace). The Ionic colonnade, stucco caryatids and paintings in the vault all give the Oval Hall a distinctive architectonic quality. The two tiers of windows and the artificial white marble facings on the walls and mirrors help create the impression of a light space which opens onto the space outside. The refined yet austere decor of the Crimson and Blue Drawing Rooms was the work of A. Vighi and D.-B. Skotti. The study is equally full of excellent paintings. Contemporaries considered the Elagin palace to be “an example of exquisite taste and refined architecture”. They noted that “every room possesses a sense of harmony: the bronze artefacts, the furniture, marble fireplaces, vases and the wallpaper – everything meets the purpose of the room” (the building was badly damaged during the blockade of Leningrad and was restored in the 1950s).

Rossi designed and partially completed new interiors for the main state rooms in the Winter Palace, the Imperial family’s main residence (1817–18, 1826–27) where he modified the classical methods of composition and decoration so that every room was unique. In general, the main halls had a strict decorative order imposed on them; the bedchambers were painted in delicate patterns, and the decorative qualities of the fabrics were used to particularly good effect. Unfortunately these interiors were destroyed in the catastrophic fire of 1837; only the War of 1812 Gallery (1826–27) was left intact (with some small alterations) – a majestic memorial to the victory in the great war against Napoleon’s armies. The gallery has more than 330 portraits of generals and war heroes, painted by the English artist D. Doy. There are no windows in the room and Rossi cleverly solved the problem of the lack of natural light by putting glass openings in the vaulted ceiling. The huge chandeliers were deliberately made to look like laurel wreaths above the heads of the war heroes. The painting in the high cylindrical vault is the work of D.-B. Skotti and depicts military triumphs.

Rossi’s greatest achievement in interior design was the Mikhailovsky Palace in St. Petersburg, built from 1819 to 1825 for the Grand Duke Mikhail Pavlovich, the brother of Alexander I and Nikolai I. Rossi designed massive ensembles of halls and employed a vast range of decorative styles for their decor. The nucleus of the design was the grand main staircase. Below it the space seemed to be suppressed by blank walls; above the staircase it moved more freely, sweeping around wide galleries with colonnades. Powerful Atlas figures, painted as though they were holding up the ceiling, accentuated the spatial effect. The grandest rooms in the palace were the Yellow Dining Room and the Ballroom, which had a blue and white decor. Faux marble, *trompe-l’oeil* painted renderings of stucco mouldings, friezes and *panneaux*, bronze gilded furniture and light fittings, the effect of which was multiplied by the use of mirrors, were used throughout the palace, and Rossi designed individual suites of furniture for each room to complement the architectural features he had employed.

Little remains of the Mikhailovsky Palace’s former splendour. Most of the rooms were renovated when the Russian

Museum acquired the building in the 1890s. Apart from the main staircase, the only room which retains its original decor is the White Room. Its friezes (by A. Vighi) and furniture are organically linked to the overall structure of the room, which is divided by columns into three areas. The furniture is not only arranged along the walls, but also within the hall itself, dividing the internal space into manageable zones. The Mikhailovsky Palace delighted not only the people of St. Petersburg, but also European visitors. King George IV ordered a large-scale model of the White Room, which was made by Russian craftsmen and transported to London.

The most famous of Rossi’s buildings was the headquarters of the Ministry and the General Staff (1819–29) on Palace Square. The building is interesting for the innovations in its construction. Rossi skilfully used metal frameworks for the cupola over the library (with a diameter of 30 metres), and for the ceilings of the round galleries and the archive. They were made by an eminent engineer from Petersburg, a native of England, M.E. Clark. Within the interiors of the Ministry, Rossi once again put rows of pilasters along the walls and introduced *plafonds* painted with voluptuous female figures and decorative patterns.

From 1828 to 1834, Rossi designed a vast complex, known as the Alexandrovsky Theatre ensemble, which included two squares and a street, the Theatre, Public Library and a number of administrative buildings. At the centre of the ensemble was the theatre, a compact, rectangular volume with a multi-tiered auditorium and a deep stage. The foyer and other rooms have comparatively modest decors and the whole effect is concentrated in the auditorium with its lavish and glittering decoration (which has survived, albeit with a number of alterations). Outlined on the plans as a bow-shaped room, the auditorium is outstanding both acoustically and visually. Its colours and forms are quite captivating. The decor is a combination of military insignia and theatrical attributes. The slender elongated columns and the lancet arches along the walls in the boxes are highly original. These details introduce an unexpected neo-Gothic touch to the otherwise Empire style of the auditorium. In using a cast-iron construction for the stage’s portal and the roof of the theatre (also built by M.E. Clark) Rossi had to overcome not only bureaucratic officialdom, but also the opposition of the most experienced St. Petersburg engineers. Other architects were responsible for the interior design of the Public Library and other buildings in the ensemble. The same was the case with the Senate and Synod buildings (1829–34); the latter was one of Rossi’s most remarkable projects, but it never got beyond the design stage.

Rossi designed furniture and *objets d’art* for other buildings apart from his own. The best craftsmen in Russia – I. Bauman, V. Bobkov, A. Tur and G. Hambs – worked on his furniture designs which, as a rule, were characterized by a clarity of line, expressive proportions and effective combinations of the texture of the wood and the design superimposed on it. All the furniture was made from red wood, either Karelian birch or poplar, and was sometimes painted white with gilt details. Rossi preferred to use bronze, cut-glass crystal or coloured glass for his light fittings. He was also particularly fond of using decorative stone vases. These were made in factories in Peterhof, Ekaterinburg and Kolivansk and were one of two basic compositional types: tall and oval-shaped, or short, like

a flat cup. They all shared the same fine qualities which enhanced the natural beauty of the stone.

At the beginning of the 1830s Rossi fell out of favour with the Imperial government and he retired. The end of his brilliant career coincided with the rapid decline of late Neo-Classicism and the Empire style. For the last fifteen years of his life, Rossi contributed nothing of any significance, either as an architect or as an interior designer.

BORIS KIRIKOV

translated by Charlotte Combes

Biography

Karl Ivanovich Rossi. Born in Pavlovsk, Russia, the son of an Italian ballerina, in 1775. Studied with the architect Vincenzo Brenna (1747–c.1819); named as Brenna's assistant by 1796 and worked with him on the construction of Pavlovsk, Gatchina and the Mikhailovsky Castle, St. Petersburg. Toured Europe with Brenna, 1802–05. Married twice: 10 children. Worked independently in Moscow and Tver, 1808–12; returned to St. Petersburg, 1814; became leading member of the Committee of Building and Hydraulics, St. Petersburg, 1814. Died in 1849.

Selected Works

Interiors

- 1816 & Pavlovsky Palace, Pavlovsk (additions and interiors including the large library)
- 1822–24 Anichkov Palace, St. Petersburg (remodelling and interiors)
- 1818–22 Park Palace Complex, Elagin Island (buildings and interiors; park designer D. Busch)
- 1819–c.25 Mikhailovsky Castle, St. Petersburg (building and interiors including the state apartments)
- 1819–29 Ministry and General Staff Headquarters, St. Petersburg (building and interiors)
- 1826–27 Winter Palace, St. Petersburg (interiors including the War of 1812 Gallery)
- c.1828–34 Alexandrovsky Theatre Ensemble, St. Petersburg (architecture and planning and interior of theatre)

Ruhlmann, Jacques-Emile 1879–1933

French designer of interiors and furnishings

The elegant and finely crafted furnishings and interiors designed by Jacques-Emile Ruhlmann exemplify the most fashionable and luxurious aspects of Parisian Art Deco. Born of Alsatian parentage in Paris in 1879, Ruhlmann was the son of a prosperous house painter who owned a shop specialising in wallpaper, mirrors and paintings located in the up-market 1st arrondissement, near the Place Vendôme. He joined the family business in 1897 after leaving school and returned to the firm after national service in 1901 when he began designing wall-papers and his first unrealised pieces of furniture. On the death of his father in 1907, he took over the running of the Société Ruhlmann and was thereafter closely involved in the design of furnishings and decoration. Despite his lack of any formal training, his work was to exercise a profound influence on the Art Deco style throughout the 1920s and 1930s.

In 1912 the family business moved to new premises with entrances on both the rue de Maleville and rue de Lisbonne, in the 8th arrondissement, and the following year Ruhlmann decided to add decorating and furnishing agencies to the firm. The same year he exhibited a secrétaire at the Salon d'Automne. Unfit for military service during World War I, he continued designing furniture, and when peace came, established Ruhlmann & Laurent in 1919, with Pierre Laurent, an expert in paintings. During the next fourteen years the company was to acquire an international reputation for quality workmanship and innovative design. In 1920 Ruhlmann was made a Sociétaire of the Salon d'Automne and was a founder-member of the Société des Artistes Décorateurs. In 1926 he was made Chevalier de la Légion d'Honneur. He died in 1933, having ordered the winding up of the company he founded.

Ruhlmann was a perfectionist in every area of his work. He was not a cabinet-maker himself, so his furniture was produced either by outworkers or in his own workshops, but he did not allow the craftsmen to depart from the plans – again produced by specialists – in even the smallest degree. He was also unashamedly elitist: "New creations have never been made for the middle classes. They have always been made at the request of an elite which unsparingly gives artists the time and money needed for laborious research and perfection of execution." At the same time, his approach to manufacture was refreshingly down to earth. "I work on the principle that nothing that can be done by machine should be done by hand. Modern furniture has little ornamentation and consists almost entirely of flat surfaces veneered with precious woods. Machines make it easier to do the preparatory work, to make the carcass."

Between 1913 and 1923 Ruhlmann's furniture was made by Haentges Frères & Fenot, but to ensure the strict control of manufacture, he developed his own workshops in the rue d'Ouessant which, by 1927, comprised six floors devoted to specific crafts. The first floor was used for cellular lacquering, the second for upholstery and the third for cabinet-making. The fourth floor was the Atelier, later divided into two sections, where designs were finalised and manufacturing plans drawn to various scales. The fifth floor was occupied by a panelling shop and the sixth used for the storage of wood and

Ruhlmann: bedroom for 1925 Paris Exposition Internationale des Arts Décoratifs et Industriels Modernes

veneers. The mirror department was moved to other premises around this time. The original two-entranced premises remained as a shop and display area, which included lighting, contemporary ceramics, glass, sculpture and paintings, as well as the administration of the company which employed a wide range of expert craftsmen.

In much of his furniture, fine craftsmanship was matched and complemented by the use of rare and expensive materials. Woods such as macassar ebony, ambrosia, American burr-walnut and violet wood feature prominently, with inlays of ivory or tortoiseshell and shagreen. For marquetry work, Ruhlmann would have woods dyed various colours, but also used the natural grains and burrs as part of the decorative scheme. Surprisingly, he produced little lacquerware, having experimented in partnership with Jean Dunand (*Salon des Artistes Décorateurs*, 1927) but he did develop a cellular lacquer spray technique (Duco) which he used on plainer furniture, such as the Ducharne Bar of 1930, jokingly mounted on skis!

Ruhlmann's sketchbooks show clearly his working methods. Most designs appear in six to eight stages, often starting with items whose appearance suggests a strong 18th-century influence. This was refined and simplified until he arrived at the final vigorous geometric forms which emphasise the volume and sculptural qualities of the piece. These qualities

were themselves reinforced by subtle surface decoration or inlay and represented a determined break away from the curvilinear and naturalistic fantasy of Art Nouveau furniture. Only in details such as lock plates, by Foucault or Janniot, do figurative designs occasionally appear.

Most of Ruhlmann's work was for individual clients, with items often named after the original commission, although occasionally, as in some furnishings for the Cité Universitaire, multiples were produced. Minor modifications, however, such as slight changes in form or variations in materials or decoration, were sometimes incorporated. Much of Ruhlmann's work reflects his fondness for 18th-century Neo-Classical styles but towards the end of his career he experimented with more Modernist designs including furniture made of glass and chromium-plated steel. In 1929 he devised a scheme of modular furniture in macassar ebony for the Maharajah of Indore which could be assembled to provide filing cabinets, display cases, sideboards or room dividers, and which could also be produced in less luxurious materials.

Ruhlmann's largest single commission and the crowning point of his career, was the House of an Art Collector in the 1925 Paris Exhibition. The architect of the building was Pierre Patout, a lifelong friend since they had met during national service in 1900, and Ruhlmann designed the interiors and coordinated the work of more than 80 artists and craftsmen as

“Master of Works”. His furniture for the study included a desk and bookcase in solid macassar ebony with metal frames and a voluminous hide-covered *Elephant* armchair. The heaviness and mass of many of his pieces was lightened by the use of legs that were attached halfway or more up the side of a cabinet, table or sideboard, rather than supporting it from underneath. These legs were often fluted or faceted; in the latter case the edges were inlaid with ivory. After c.1923 these were often delicately curved.

During the late 1920s Ruhlmann was responsible for a series of interiors for luxury apartments, rooms for the Paris Chamber of Commerce (c.1926) and in 1927, interiors for the *Ile de France*. The *Ile de France* was literally the flagship both of the Compagnie Générale Transatlantique and of contemporary French decorative arts – a floating exhibition of luxurious interior decor. Ruhlmann’s First Class Lounge and the attached Salon de Thé were panelled in coloured veneered ashwood and used mirrors to increase the width of the companionways and back-lit frosted “windows” to give light to the area that was below the water-line. If Ruhlmann did not create the Art Deco style, he was perhaps its finest exponent.

Biography

Born in Paris, 28 August 1879, the son of a housepainter. Studied painting informally; began designing furniture, 1901. Trained and worked with his father in the family housepainting business, Société Ruhlmann, from c.1897. Married Marguerite Seabrook, 1907. Took over management of the family firm; business moved to new premises and divided into two sections, 1912–13: paint, wallpaper and mirror workshops, 10 rue de Maleville, and interior design and furnishings agency, 27 rue de Lisbonne. Founded Etablissements Ruhlmann et Laurent, interior design and decorating business, in partnership with Pierre Laurent, 1919; business wound up, 1933. Designed wallpapers, lighting, textiles and furniture from c.1911; numerous commissions for furnishings and interiors throughout the 1920s and early 1930s. Exhibited at the Salon d’Automne, from 1910, and at the Salon des Artistes Décorateurs, Paris 1925 and 1931. Chevalier, Légion d’Honneur, 1926. Died in Paris, 15 November 1933.

Selected Works

Collections of Ruhlmann’s sketchbooks, including working drawings for furniture and designs for patterns, are in the Musée des Arts Décoratifs, and the Bibliothèque Nationale, Paris. Examples of Ruhlmann’s furniture are in the Art Gallery and Museums, Brighton, the Victoria and Albert Museum, London, the Metropolitan Museum of Art, New York, the Musée des Arts Décoratifs, Paris, and the Toledo Museum of Art, Ohio.

Interiors

- 1924–25 Hôtel Ruhlmann, 27 rue de Lisbonne, Paris (decorations and furnishings)
- 1925 Exposition des Arts Décoratifs et Industriels, Paris (Hôtel du Collectionneur; interiors and furnishings with others including Pierre Patout, Léon Jallot, Jean Puiforcat, Jean Dunand, Edgar Brandt, Pierre Legrain, Emile Decœur and François-Emile Decorchemont)
- c.1926 Chambre de Commerce, Hôtel Potocki, Paris (decoration and furnishings for the conference chamber and ballroom)
- 1927 *Ile de France* liner (decoration and furnishings for the Salon de Thé, passageways, and games room)
- 1929 Salon, Société des Artistes Décorateurs, Paris (furniture for the Maharajah of Indore)

- 1932 Salon, Société des Artistes Décorateurs, Paris (decoration and furnishings for “Rendez-Vous de Pecheurs de Truites” including a hall-living-diningroom and bedroom)

Russell, Gordon 1892–1980

British designer and furniture maker, writer and administrator

The work and ideas of the designer and furniture maker Gordon Russell have made an important contribution to 20th-century British design. Yet, surprisingly, Russell himself received no formal training, and his early, formative influences arose largely out of his family background and circumstances. Russell’s lifelong love of craftsmanship, buildings and furniture began in 1904 when he moved from London, with his mother and brothers, to join his father in Broadway, a small village in the Cotswolds. S. B. Russell had recently purchased the Lygon Arms, a pub in the village, with the intention of turning it into a country hotel. And it was this move, and a childhood spent observing at first hand the refurbishing of the Lygon Arms, that were to prove decisive factors in determining the younger Russell’s interest in, and philosophy for design and manufacture. He later acknowledged his debt to his Worcestershire childhood in a recollection that also summarised the central tenets of his design ethos, declaring: “I never cease to be grateful to my unknown but deeply revered teachers, the builders of these little Cotswold towns and villages. I came to them to

learn and they taught me many things for lack of which the world is a poorer place today. They taught me that to build beautifully is quite different from beautifying a building. They taught me to employ direct, workmanlike methods and to try to apply the searching test of honesty to all work and actions".

Clearly Russell had absorbed much of the mood of the British Arts and Crafts Movement. Again, a childhood spent in the Cotswolds would have been very significant in this respect. William Morris had lived at Kelmscott, thirty miles from Broadway, until 1896; C.R. Ashbee was working with his Guild of Handicraft, established in 1902, in nearby Chipping Camden; and the furniture makers, Edward and Sidney Barnsley and Ernest Gimson, had also recently moved to the area. But, while the spirit of the Arts and Crafts Movement exerted a profound influence upon Russell's sympathies as a designer, he did not altogether adhere to its practices. He recalled: "I saw that the Arts and Crafts leaders were trying to bring designer and maker together, in itself a worthy objective, but by insisting that the craftsman should design everything that he made they went a bit too far ... It became clear that the designer must have a thorough knowledge of the methods of production, whether by hand or machine" (Myerson, 1992).

Russell's involvement with furniture began in 1908 when he joined his father's antiques business and worked on the repair of old pieces; in 1919 he was made a partner in the firm and began experimenting with design. His influence was first felt at a very local level in the furniture, glass- and metalwork designs made at the Russell workshops and on sale in the Lygon Cottage showrooms in the 1920s. The period in which he was actively involved in design, however, was quite short-lived and, despite winning a gold medal at the Paris 1925 exhibition, he abandoned this work at the end of the decade. Dick Russell, Gordon's younger brother, had returned from training at the Architectural Association where he had met his future wife, Marian Pepler. Having received a thorough grounding in Modernism, it was he rather than Gordon who now began to produce designs for Gordon Russell Ltd., the company that was formed with a London showroom in 1929. The firm became known for furniture that was solid, sensible and well-made, blending simple modern forms with traditional wood finishes and vernacular features such as the ladderback for chairs. Its designs became synonymous with British Modernism in the post-war period.

Meanwhile, Russell himself had his first chance to put his ideas about the importance of the machine process and its applicability to good design into practice in 1931. The engineer Frank Murphy had contacted Russell in his search for contemporary, well-designed and well-made cabinets for his radio sets. The alliance was to suit Russell well since Murphy's aim was to use industrial design to shape the radio set's formal qualities and with Dick Russell as Murphy's in-house designer, the brothers' ideas increasingly moved away from their craft-based origins towards the possibilities for improving standards for mass production.

This shift in emphasis was to come to the fore during World War II. In 1942, Gordon Russell received an invitation from the Board of Trade President, Hugh Dalton, to join the Utility Furniture Advisory Committee (UFAC). Established the previous year, the committee aimed to produce quality furniture of simple solid design and construction using a minimum of the

now-rationed timber supplies. Russell seized the opportunity to combine neat, unornamented modern design with an emphasis on craftsmanlike quality for mass manufacture. Chairing the UFAC between 1943 and 1947, Russell also had the chance to proselytise the benefits of Utility design and firmly believed that if British design was to achieve its potential, the taste of both retailer and public needed to be reformed.

In 1947 Russell became Director of the Council of Industrial Design (CoID) and was given the best opportunity for realising his reformist ideals. He steered the Council through the years of post-war reconstruction, and his influence was felt at a number of important government-backed exhibitions, notably the 1951 Festival of Britain held at London's South Bank. A more lasting chance for the CoID to make its mark under Russell's aegis came in 1956 with the opening of a permanent national exhibition centre for design – later the home of the Design Council – in the Haymarket in London.

Retiring from public service in London the following year, Russell returned to the Cotswolds and to Gordon Russell Ltd. with which he had not been actively involved for twenty years. Changes in the retail market led to the need for the company to take a new direction, and the 1970s saw an expansion of activity and a move away from domestic furniture into the contract market. Once again, Russell's vision and his ability to see the potential offered by different opportunities came to the fore, enabling the creation of a new-look company with the vitality and international reputation to carry it forward with a new lease of life. It is proof of Russell's convictions that the company had already received an RSA Presidential Award for Design Management in 1962.

Gordon Russell died at the age of 88 in 1980, and, although taken over by the multi-national company Steelcase Strafor at the end of the 1980s, the Gordon Russell name is still preserved as a separate identity within the larger organisation. Steelcase Strafor recognise Gordon Russell Ltd.'s unique qualities and their description of them is just as applicable to Russell's personal vision as it is to his company's mission: "It is one of entrepreneurship, international vision and innovation" and, its "heritage can be made accessible and relevant to contemporary markets without the company losing that special quality, style and mystique".

Biography

Sydney Gordon Russell. Born in Cricklewood, London, 20 May 1892. Educated in London and in Repton, Derbyshire, until 1904; moved to Broadway, Worcestershire, and educated in Chipping Camden, Gloucestershire, 1904–07. Served in the British Army Worcester Regiment, 1914–19; Military Cross, 1918; served as Special Police Officer, London, 1939–45. Married Constance Elizabeth Jane Vere (Toni) Denning in 1921; 4 children. Worked as a furniture restorer and manager in his father's antiques business, 1908–14; partner, Russell and Sons furniture makers, Broadway, 1919–46. Founder-director, Gordon Russell Ltd. furniture makers, Chipping Campden, 1926–66; Chairman, 1966–77. Founder-director, Gordon Russell design studio, Kingcombe, Gloucestershire, 1960–80. Published various books on crafts and furniture from the 1920s. Chairman, Board of Trade Utility Furniture Advisory Committee, London, 1943–47; Director, 1947–59, and life-member, 1960–80, Council of Industrial Design, London; President, Design and

Industries Association, London, 1959–62. Member of numerous arts organisations and committees including Royal Society of Arts, 1947–49 and 1951–55, Royal College of Art council member, 1948–51 and 1952–63, and Crafts Advisory Council, 1971–74. Fellow, Society of Industrial Artists, 1945, Royal Institute of British Architects, 1965. Numerous honours including Commander, Order of the British Empire (CBE), 1947; Knighted, 1955. Died in Kingcombe, 7 October 1980.

Selected Works

Examples of Gordon Russell Furniture are held at the Museum and Art Gallery, Cheltenham, and at the Victoria and Albert Museum, London. The company's archive, including designs, correspondence, catalogues, and business records, is held by Gordon Russell Ltd., Broadway.

Russia

Many of the surviving Russian buildings from the 11th to the 17th centuries are ecclesiastical and their interiors remain largely unaltered. The solid, cross-shaped and domed church type, which differed from the Western European basilica, was introduced to Russia from Byzantium, as was the use of monumental paintings. Wall paintings and icons were the main means of transforming the internal space (sculpture and

stained glass windows were alien to the ancient Russian church interior).

Within the ancient Cathedral of Sancta Sophia in Kiev (completed in 1037), which has a structure of five naves on an almost square plan, both the original frescoes and the monumental mosaic of the Virgin Orans in the semi-dome of the apse have survived, the latter forming the focus of the entire inner space of the church. Subsequent church construction involved the use of distinctive national methods amidst the development of regional schools of architecture with their own types of churches. Mosaic came to be replaced by fresco.

The most significant examples of church painting were completed in the second half of the 14th century and the beginning of the 15th century by Theophanes the Greek (the Church of the Transfiguration in Novgorod, 1378) and Andrei Rublev (the Church of the Dormition in Vladimir, 1408; the Church of the Trinity in the Trinity-Sergius Monastery, 1425–27). The work of Theophanes the Greek was very powerful and was characterized by the dramatic expression of forms and a bold and grand painterly style. Rublev's frescoes contained a heightened spirituality and a calm sense of harmony, purity and perfection. The highly acclaimed painter Dionysius, who worked at the end of the 15th and beginning of the 16th century, brought a lightness and refinement to church frescoes, as well as a festive sense of order (Therapont Monastery, 1500–03). A new, specifically Russian type of iconostasis came into being in the 15th century, replacing the low Byzantine altar barriers. The Russian iconostasis consisted of a multi-tiered construction with rows of icons, creating a clear barrier between the altar-space and the main part of the church.

The transformation of Moscow in the second half of the 15th century into the capital city of a centralized single state led to the complete reconstruction of the city's Kremlin. Italian masters were involved in the project. Within the Cathedral of the Dormition (1475–79), built by Aristotele Fioravanti from Bologna, a traditional Russian structure was combined with a Renaissance-style division of the internal space into compartments of equal size. This created a feeling of integrity and an unusual sense of spaciousness, so that the church interior was more like a grand hall. The most important secular state building was the Faceted Palace in the Moscow Kremlin (1487–91, built by the Italian architects Marco Frazzini and Pietro Antonio Solario). This is the oldest example of a civic interior in Russia, apart from the Archbishop's Palace (*Vladichnaya palata*) in Novgorod (1433). The palace's design, which involved a central load-bearing column supporting a groined vault, was already known in Russia. The main innovation was the sheer size of the square hall (approximately 500 square metres). At the end of the 16th century, the white stone walls of the palace were painted with religious and historical subjects.

By the 17th century, church architecture was dominated by a clear, patterned style. This was most marked in the churches of Moscow, Yaroslavl and Nizhni-Novgorod, where several decorative paintings and magnificent carved iconostases have survived. Traces of the influence of Western European Mannerism and Baroque can be found both in the interiors and on the façades of buildings. The most notable monument to 17th-century Russian architecture was the Terem Palace in the Moscow Kremlin (1635–36). It was built of stone and brick,

Russia: Rotunda, Winter Palace, St. Petersburg, by Bartolomeo Rastrelli, 1754–62; watercolour of 1862

although ancient Russian buildings were traditionally made out of wood. The domestic quarters were situated down below, the main floor was given over to the Imperial rooms and the largest apartment (the "attic" room or Terem) was situated at the top of the palace. Inside, the palace was decorated throughout with fantastic patterns of vegetation and symbolic compositions. In the 17th century, brick houses were built for wealthy merchants in Moscow, Pskov, Gorokhovets and other cities. As a rule, these houses had a passage (vestibule) in the middle which linked all the reception rooms; the living quarters were situated upstairs in additional wooden storeys. The walls and vaults were usually whitewashed and often decorated with ornamental paintings and tapestries. The stoves, faced with tiles, occupied an important place in the overall structure of the interior, as did the new furniture that was installed.

At the end of the 17th and beginning of the 18th century, Russian culture underwent fundamental changes, linked to the reforms of Peter I (the Great). Saint Petersburg, founded in 1703, became the focus of frenetic attempts to assimilate and equal the achievements of the West. The world of the interior played a significant role in Peter's reforms, becoming one of the ways of transforming the old tenor of life. Foreign architects and artists were invited to Petersburg and this promoted the rapid establishment of a European type of interior. Houses were designed with the main suite of reception rooms and entrance hall arranged along the building's central axis; rooms appeared that were new to Russia: studies, state bedchambers etc. For the first time, a sense of order was imposed on the decoration of the interior. *Plafonds* were decorated with allegorical paintings and stucco moulding; wallpaper and paintings began to be widely used, as was fretwork and glass. One of the distinguishing characteristics of Peter the Great's era was the construction of large kitchens following the Dutch model, with the walls and even the ceilings faced with Dutch and Russian ceramic tiles. Furniture, on the whole, came from Holland, Germany and England or was made by Russian craftsmen in imitation of Western examples.

Of the interiors from the beginning of the 18th century which have survived to the present day, those that stand out are Peter I's Summer Palace (1710–14, D.M. Fontana, I.G. Shedel) and the Palace of Monplaisir at Peterhof (1714–22, J.B. Le Blond). They both reflect a fusion of Dutch burgher tastes with classical Baroque and Rococo motifs (especially at Monplaisir). The interior of the Cathedral in the Peter and Paul Fortress in St. Petersburg (1712–33, D. Tressini) is especially interesting. The very nature of the building, a basilica with three naves, was new to Russia, as was the use of wall paintings and the dynamic forms on the carved wooden iconostasis which are the apotheosis of Peter the Great's early Baroque style. The art of the interior from this period was characterized by a stylistic diversity; it absorbed impulses from different European schools, including both Baroque and classical trends.

The mid-18th century marked the golden age of Russian Baroque, largely due to the work of the brilliant Bartolomeo Rastrelli (c.1700–71), court architect to the Empress Elizabeth I. Rastrelli's magnificent palace interiors, which exuded luxury and capricious fantasy, revealed his liking for dramatic effect. The extensive suites of reception rooms stretching out one after another created the impression of endless perspectives, and the play of reflections from the huge mirrors gave the illusion of

limitless space. Rastrelli employed the widest possible range of decorative devices: painting, stucco moulding and fretwork, gilding and parquet flooring. The lavish and lively patterns of the decor took on a life and significance of their own. Rastrelli came closest of all to the Rococo style in his treatment of the interior. As part of this, his plans were distinguished by precise rectilinear axes and outlines.

Rastrelli's greatest interiors in the Grand Palace at Peterhof (1746–55) and in Catherine's Palace at Tsarskoe Selo (1752–56) were restored after World War II. His style of arranging several suites of rooms one after another is seen to greatest effect in Catherine's Palace where adjoining rooms stretch the whole length of the extensive building. Rastrelli's magnificent decorative style reached its height in the palace's Throne Room. Within the Winter Palace (1754–62), only the chapel, main staircase and galleries have survived of Rastrelli's original interiors. The other great master of the Baroque was S.N. Chevakinsky, who was responsible for the interiors of the Duke I.I. Shuvalov's palace and the naval Church of St. Nicholas in Petersburg (1750s). Russian furniture from the mid-18th century mainly reflected French influences and echoed the forms of Baroque and Rococo architecture.

In the 1760s, following the accession of Catherine II, Russian Baroque was replaced by Classicism. There were various manifestations of the early stages of this style. In his work, Antonio Rinaldi (c.1710–94) evolved from a refined Rococo style to a stricter classical manner, relying on Italian examples. The interiors of Peter III's palaces (1758–62) and the Chinese Palace (1762–74) at Oranienbaum provide exquisite examples of the Rococo style. The Chinese motifs (*Chinoiserie*) used to decorate the interiors are also in keeping with the spirit of Rococo. The Marble Palace in Petersburg (1768–85), built by Rinaldi, still has traces of the Baroque and the Rococo in its decor, but, at the same time, the structure of its Marble Hall reflects Renaissance methods. Virtually none of the classical interiors of Yu. M. Velten (the Grand Palace at Peterhof, 1770s) and J.B. Vallin Delamot, which cultivated a classical style along French lines in Russia, have survived to the present day. The entrance hall which they designed for the Petersburg Academy of Fine Arts has faint echoes of the Baroque.

The 1780s and 1790s marked a period of strict Neo-Classicism in Russian architecture and design, drawing on Palladianism and architectural motifs from ancient Rome. The imposition of order set against a background of large blank walls became the main means for the architect to organise the internal space. The composition and decoration of the interior became more laconic and purely architectural in nature, with fewer sculptures and paintings. Above all, this style was typical of the work of Giacomo Quarenghi (1744–1817), who worked mostly in St. Petersburg. Quarenghi's most important interiors were the auditorium of the Hermitage Theatre (1783–87), designed as an amphitheatre in imitation of Andrea Palladio's Theatre of Olympia in Vicenza, and the Assembly Hall in the Smolny Institute (1806–08). The most accomplished master of the Neo-Classical interior was Charles Cameron (c.1745–1812), a follower of English Palladianism. The rooms which he decorated for Catherine's Palace and the complex of bathhouses at Tsarskoe Selo (1780s) are charming for the delicate drawings and colours which they display, as well as for the subtle combinations of different kinds of brick, china, crystal

Russia: Large Chinese Room, Chinese Palace, Oranienbaum, by Antonio Rinaldi, 1762–69

and mother of pearl. The palace at Pavlovsk (1782–86) is particularly close to English Palladianism, with a circular hall at its centre. The Tauride Palace in Petersburg (1783–87), built by I. Ye. Starov (1745–1808) is generally seen as the standard-bearer of strict Neo-Classicism. The main suite of reception rooms does not follow the length of the façade, but rather penetrates deep into the inner reaches of the palace. One room flows into the next and an immense gallery with a double Ionic colonnade (the largest example in Russia of a columned hall in the classical style) opens onto an enclosed Winter Garden, which is in turn linked to the palace park.

For a long time, the methods of the early stages of Russian classicism were maintained in the work of the founders and leaders of the Moscow School of Classical Architecture, V.I. Bazhenov (1737–99) and M.F. Kazakov (1738–1812). Bazhenov often designed interiors with different layouts, including circular rooms (the Pashkov Palace, 1784–87). Kazakov was one of the most accomplished masters of the Russian interior. In his work, a compact and saturated decor combines with a strict elegance, and the splendour of his interiors blends perfectly with the need for comfort. The “Golden Rooms” in I.I. Demidov’s house (1780s) were decorated with simple and exquisite patterns of vegetation, as well as with

stucco moulding and gilt carving. Kazakov was responsible for designing magnificent columned interiors, for example, the Round Senate Hall in the Moscow Kremlin (1776–87) and the square-shaped Meeting Hall of the Russian Nobility (1780s). Both of these inspired much imitation. Of the country estates built around Moscow at the end of the 18th century, the palace / theatre in Count Sheremetev’s residence at Ostankino, built in the 1790s by I.P. Argunov and others from a design reworked by F. Camporezi, stands out in particular. Both the building and the interiors were completed out of wood with the most delicate imitations of stone masonry, marble, bronze and stucco moulding.

The Michael Castle (1797–1800) – Paul I’s palace in Petersburg – is a building which sums up Russian 18th-century interior design. The castle’s interiors, designed by Vincenzo Brenna (1747–1819), are richly decorated and eclectic in nature. Brenna favoured an exaggerated decor and a departure from strict classical norms. The work of his younger contemporary, A.N. Voronikhin (1759–1814) united the two centuries. It was as if all the refinement of his interiors for Count Stroganov’s palace (1790s) continued the trend begun by Cameron. Voronikhin’s designs for the interiors of the

Russia: Leonardo Room, Old Hermitage, by A. I. Shtakenschneider, 1860

palace at Pavlovsk and for the Kazan Cathedral (1800s) came closer to the methods of high classicism.

The greatest exponents of the new, emerging Empire Style were A.D. Zakharov (1761–1811) and Jean-François Thomas de Thomon (1760–1813), who both also worked in Petersburg. The main staircase in the entrance hall of the Admiralty, with its air of monumentality and the lapidary nature of its grand, generalized forms, was Zakharov's masterpiece. A sense of restrained power was also a feature of Thomon's interiors (Lavalle's private residence; the Exchange, 1800s). The interiors designed by V.P. Stasov (1769–1848) have many ordered elements and are very restrained. They also introduce paintings as part of the decor.

The last great master of the Petersburg Empire Style, Karl Ivanovich Rossi (1775–1849), is known first and foremost as the creator of vast ensembles. He also maintained the principle of the grand ensemble when designing interiors. Rossi's style was characterized by a powerful sense of ceremony and by an elegant and saturated decor. He demonstrated exceptional skill

in utilizing all the different arts. The sculptors V.I. Demut-Malinovsky and S.S. Pimenov, as well as other talented artists, worked alongside Rossi. The interiors of the Elagin and Mikhailovsky Palaces (1820s), and the auditorium of the Alexandrovsky Theatre (1828–32) rank amongst Rossi's greatest achievements.

The Moscow Empire Style was attractive for its restraint and almost ascetic simplicity, as well as for a certain lyricism and a desire for comfort. The leading architects of the Moscow School, Domenico Gillardi (1785–1845) and O.I. Bove (1784–1834), achieved a special three-dimensional quality in their decoration of walls and ordered elements. The University's Assembly Hall (1817–19), designed by Gigliardi in the form of a gigantic conch shell decorated with grisaille paintings, is quite unique.

The work of Rossi, Gigliardi and their contemporaries marked the end of the great epoch of Classicism in Russia. New Romantic trends accelerated the rapid decline of the style and heralded a new period of historicism, beginning with the

Gothic Revival. The small palace built for Nicholas I's family, the Cottage at Peterhof (1826–29, A.A. Menelaus), built in the spirit of English Gothic, was a seminal work for the development of the new style. Work on the Cottage gave rise to a new principle for organising the interior, based on the demands of comfort. Formal reception suites were replaced by isolated groups of rooms with simple arrangements of furniture. A.P. Briullov demonstrated the return to different historical styles in his work on the restoration of the Winter Palace after the fire of 1837 (1838–39). The transition from the Empire to a neo-Renaissance style can be seen in the internal decoration of St. Isaac's Cathedral in Petersburg (1818–58, A.A. Montferrand). The decor of the Main Halls in the Great Kremlin Palace in Moscow (1838–49, K.A. Ton) is characterized by a mixture of classical and medieval styles.

The leading Petersburg architect of the mid-19th century, A.I. Shtakensneider (1802–65), showed great skill in his ability to alternate between neo-Renaissance, Baroque, Rococo, Pompeian and Neo-Classical styles in the interiors he designed for palaces, private residences and park pavilions. Another great master of the interior was G.A. Bosse (1812–94); he was the most consistent in his development of the innovative system of free asymmetrical planning. The internal decorations that were completed for the palace of the Grand Duke Vladimir Alexandrovich in Petersburg (1867–72, A.I. Rezanov) showed that a certain stylistic diversity had established itself in Russian 19th-century interior design. Palace interiors during this period of eclecticism revealed an ever increasing inclination towards smaller forms and saturated decors, as well as a liking for separate rooms with all the spaces crammed with objects. The retrospective decoration of interiors sometimes combined arbitrarily with the latest iron and glass constructions for floors and ceilings. The Commercial Rows in Moscow (1889–93, A.N. Pomerantsev) and the Museum of Baron Stiglits in Petersburg (1885–96, M.E. Mesmakher) serve as examples of this.

The Modern Style (the Russian equivalent of Art Nouveau) can be seen most clearly in the interiors of the private residences in Moscow designed by F.O. Shekhtel (1859–1926). The new style's entire expressive and decorative range can also be seen in the Vitebsk Station in Petersburg (1902–04, S.A. Brzhozovsky, S.I. Minash). Its system of open spaces flowing into one another is particularly interesting and original. A number of commercial, banking and office buildings (Shekhtel, F.I. Lidval', E.F. Virrikh, N.V. Vasil'ev) organised their internal spaces with framework constructions.

Around 1910, Russian interior design saw a reversal of trends in favour of Neo-Classical and neo-Renaissance styles. The architects I.V. Zholtovsky, I.A. Fomin and M.M. Peretyakovich designed monumental interiors for private residences and banks, all noted for their strong historicism. This retrospective trend marked the conclusion of the Petersburg epoch of interior design which had spanned two centuries. The shock waves of the Revolution were to follow.

The main creative innovations of the Soviet avant-garde took the form of the aesthetic systems known as Suprematism, devised by Kasimir Malevich, and Constructivism, founded by Vladimir Tatlin. Moscow became the centre of the Constructivist movement and it was here that its leaders in the architectural field – the Vesnin brothers and Moisei Ginzburg

Russia: staircase in S.P. Ryabushinsky's house, Moscow, by F.O. Shekhtel, 1900–02

– worked. Their ideas of a functional expediency, of the rational organisation and demarcation of space into zones, and of the most economical use of artistic materials, were realized in numerous Constructivist interiors. Of these, the Living Quarters of the Narkomfin building (1928–30, Ginzburg), with its flats on two levels, and the Likhachev Palace of Culture (1930s, the Vesnin brothers) deserve special mention. The architect K.S. Melnikov's own private house (1927–29) is one of the most original creations of the new movement, free from the postulates of Functionalism. The floors were designed as two intersecting cylindrical volumes. The diffused light from the small windows in the circular studio on the top floor created an astonishing spatial effect. Melnikov was both witty and courageous in his development of methods for the transformation of space in his series of Workers' Clubs (1927–29).

From the mid-1930s, during the period of Stalin's dictatorship, Soviet architecture and design were governed completely by a traditionalism based on the assimilation of classical architecture. This resulted in solutions which were either openly retrospective (I.V. Zholtovsky) or eclectic (A.V. Shchusev). There was an increased tendency for unchecked ornamentation and the use of all manner of decorative and fine arts in buildings' interiors. More than anywhere else, this can be seen in the decoration of the "underground palaces" of the Moscow Metro stations.

This stage of Russian interior design came to an end in the mid-1950s and with its decline came also the decline of the

“era of master architects”. The jury is still out as to whether the experiments of subsequent decades have merely been a timid neo-Functionalism and vague reflection of new quests abroad, or whether they suggest something more significant.

Rustic Style and Cottage Orné

A variety of buildings survives to recall in detail the fashionable popularity from about 1780 to 1840 of one strand of the picturesque, the Rustic Style as expressed in the architect-designed cottage orné. The English origins of this fashion are emphasised in the common habit of referring to any type of picturesque or rustic structure as “English”, even when the inspiration is clearly Swiss, as in the Hameau at Versailles. Distinctive features are the irregular plan and elevation – in contrast to the strictly symmetrical classical style then prevalent – the steeply pitched thatched roof sweeping down to the ground floor level with wide eaves supported by tree trunks, and dormers and other small fancy-shaped windows with

latted panes, often with a suggestion of Gothick which is repeated in the door frame. These ideas were applied to a plan of incredible geometric complexity for A La Ronde, a cottage orné built for the Misses Parminter in 1794. Another characteristic example of about 1809 (probably by William Evans, c.1764–1842) survives in the lodge at Gaunt's House, near Hinton Martell, Dorset. The “Swiss” style is recognisable from its construction of vertical or horizontal planks.

The American version of the Rustic style is known as “Carpenters” Gothick, so called because the small-scale wooden shingle-construction houses, lavishly decorated with bargeboarding, were well within the capacity of the local country builder. It derives from the popular and widely distributed 18th-century pattern books featuring a fanciful Gothick, by, for example, Batty Langley and the Halfpennys. Pattern books of rustic villa and cottage architecture and furniture continued to be issued in some numbers during the early years of the 19th century; after the middle of the century a shift in the perception of the Rustic or vernacular, as having a social and moral rather than decorative purpose, becomes apparent.

Abbé Laugier's *Essay on Architecture* appeared in English translation in 1755, drawing attention to theories about the derivation of the classical style from crude rustic structures made of tree trunks. Meanwhile, following the example of William Kent and Thomas Wright – the latter had embellished the park at Badminton with what may be the earliest cottage orné – a growing number of theoretical treatises on landscape and gardening focused on the relationship between the house and the natural world. Rustic estate buildings by Humphry Repton for the Earl of Leicester at Holkham, by John Soane for a dairy at Betchworth Castle and the collaboration between John Nash and George Stanley Repton at Blaise Hamlet show the influence of these works. Pattern book designs by, for example, John Plaw (1799), J. B. Papworth (1818), T. F. Hunt (1829) and P. F. Robinson (1833) draw on the same sources. The English fashion spread quickly, and the Russian Imperial Park at Peterhof was embellished in the 1820s with a Gothick cottage and a farmhouse by Adam Menelaus, based on this picturesque style.

Inspiration was not far to seek since Britain has some of the most varied and interesting medieval and later vernacular buildings in the world. Attention had been drawn to these through the fashionable idealizing watercolours of rustic buildings and by James Malton's *Essay on British Cottage Architecture* of 1798. The rustic villa or cottage orné derives from rural British precedents with an admixture of other countries and cultures, notably colonial architecture. The wide eaves of the early 19th century cottage orné come from verandas and awnings shading the terraces in tropical dwellings.

Malton wrote: “The rude ornaments of Indostan supersede those of Greece; and the returned Nabob, heated in his pursuit of wealth, imagines he imports the *chaleur* of the East with its riches; and we behold the stretched awning to form the cool shade, in the moist clime of Britain ...”. The veranda and later the conservatory linked the inside of the cottage with the outdoors, bringing the essential element of nature almost into the interior. The decoration of the cottage was thus conditioned by the proximity of garden or park. This included scenic painting and much use of trellis-work, both real and *trompe-l'oeil*. The paintwork was a harmonious mixture of buff, green

Rustic Style: Swiss Cottage, designed by P.F. Robinson, c.1830

and sky-blue, J.B. Papworth even suggesting a range of “tints resembling an autumnal leaf”.

Rustic furniture made of untrimmed branches or roots was used out of doors, and indoors the newly fashionable lightweight furniture in rosewood and fruitwood combined with simple oak joinery pieces were preferred to mahogany. Windsor and other regional chairs were advocated, but their spare, regular forms rarely appealed to the romantic (or Romantic) impulse that had led to the choice of a cottage orné.

The Hameau and farm at Versailles and the Gothic Cottage at Peterhof (recently restored) survive more or less unaltered. A La Ronde, near Exmouth in Devon, Blaise Hamlet (1810–11) at Henbury, Gloucestershire, the Swiss Cottage at Cahir Park, County Tipperary in Ireland (probably designed by Nash, about 1812), have also been restored. There is also a great variety of ornamental gate lodges and garden buildings or follies attached to the country homes of the aristocracy and landed gentry. Model estate and factory villages (Abbotsbury in Dorset is an example of the former, and Port Sunlight, Liverpool, of the latter) were added to their number throughout the 19th century. Many are now listed and carefully preserved.

A La Ronde – now open to the public, but like a matchbox in its present-day fragility – is noteworthy since it still contains the unique handmade decorations of feather- and shell-work made by the first owners, Miss Jane and Miss Mary Parminter. The Earl of Glengall’s Swiss Cottage (not at all “Swiss” as

proposed by Robinson in his various cottage books of the 1820s) at Cahir, has been described as the most perfect cottage orné in the world. All the essentials are present, including thatched roof, root-and-branch veranda and balcony, ornamental trelliswork and exotic decoration. The building has a number of deliberate imperfections – walls and windows askew, for example – to make it appear picturesque and unsophisticated. Inside there is a wooden spiral staircase and the walls of the living room are lined with the finest scenic French wallpaper showing pictures of Turkish life, supplied by Dufour et Cie. of Paris. The window panes are etched with rural scenes. The beautifully restored cottage has been designated an Irish National Monument and is open to the public.

Other well-publicised essays in the rustic style such as Nash’s Royal Cottage in Windsor Great Park and Knowle Cottage in Sidmouth are unrecognisable under subsequent alterations. Sidmouth itself was a microcosm of the picturesque, and evidence of contemporary interest comes from the large number of views that were made of the cottages, many of them preserved in the Sidmouth Museum.

The more substantial villas in the rustic mode were built to fill a gap, which widened as the 19th century progressed, between the great houses of the aristocracy and landed gentry, and the dwellings more or less thrown up for the working and labouring classes. The need to create a style for the prosperous middle-class patron was to result in many stylistic experiments. John Claudius Loudon provided the ultimate manual for the

villa owner, with his *Encyclopaedia of Cottage, Farm and Villa Architecture and Furniture* (1833, new and enlarged edition 1839). For the decorative accessories the householder could consult Shirley Hibbert's *Rustic Adornments for Homes of Taste* (1861). Periodicals like *The Builder* and *Building News* published the plans and elevations for a great variety of vernacular domestic architecture. Loudon's example was followed in the United States by the architect A.J. Downing, who published a manual of rural architecture and furniture, *The Architecture of Country Houses*, in 1850. The emphasis is on Gothic and other antiquarian styles.

The fashion for rustic architecture had a basis in the Romantic view of nature and the rural idyll as providing the ideal life. It was fascinating to those tied to a demanding social or professional life, who saw it as an escape from the artificiality of social obligations. For royalty the prospect of rural seclusion was compelling, and the rustic retreat is a recurring theme in royal building operations. Marie-Antoinette's Hameau was planned by the French royal architect Richard Mique from 1783 as a refuge from the stifling formality of court life. Although inspired by English picturesque – appropriate to the English garden surrounding the Petit Trianon and the Hameau – the buildings are little Swiss chalets. There the queen and her ladies played at farming and gardening in specially designed rustic costumes. The cottages were said to have been decorated with landscape scenes by Hubert Robert. Various attempts have been made to present the farming experiment as practical, even profit-making, but the similarities to a real farm were few; the farmhouse boasted a billiard room and the cows in the byre wore ribbon bows. The element of fantasy in these so-called farms was tellingly emphasised in the Princesse de Lamballe's dairy at Château de Rambouillet where the milk buckets were made of Sèvres porcelain.

The fully-equipped Swiss Cottage, built at Osborne House on the Isle of Wight for the children of Queen Victoria and Prince Albert, was designed to teach the royal children all the domestic arts that they would never otherwise learn.

The “Ladies of Llangollen”, Lady Eleanor Butler and Miss Sarah Ponsonby, cousins who fled their families to live away from society in a Gothick cottage in Wales, used the time gained by ignoring conventional social and domestic obligations to pursue their “system”; to “devote hearts and minds to self-improvement; to eschew the vanity of society; to beautify their surroundings and to better in so far as they could, the lot of the poor and unfortunate” (Mavor, 1971). They were the subject of much curiosity among members of the society that they had repudiated and numerous descriptions survive of their way of life. Like A La Ronde, the Ladies' Plas Newydd was a perfect example of do-it-yourself decoration, being a fantastic amalgam of ancient carvings and sculptures with fragments of stained glass retrieved from the ruins of nearby Vale Crucis Abbey.

In 1785 Queen Charlotte, passionate horticulturalist, requested plans of the cottage and garden at Llangollen, and this may have influenced her own rural domain of house and farm at Frogmore, which she transformed from 1790. Although it had been conceived as a Gothic cottage designed by James Wyatt, Frogmore emerged as a substantial classical house, but the queen's idea was to own a “little paradise”, and it contains evidence of the decorative options considered right

for a rural retreat. It has a mixture of the rural and the exotic; flower paintings by Mary Moser for one room are paralleled by imitation lacquer panelling executed by Princess Elizabeth, George III's talented younger daughter, for the “Japan” room. The Queen's Cottage at Kew also had a painted room possibly done by the Princess in about 1805. These modestly conceived retreats were cast into the shade by another royal cottage orné, Brighton Pavilion, designed by John Nash for the Prince of Wales. It was a cottage in name only, being of a size to accommodate the royal entourage.

Gradually the fashion for Rustic architecture was submerged in the Gothic style, with furniture to match. Dissatisfaction with meretricious upholsterers' Gothic led William Morris on a quest for plain furniture and inevitably to the discovery of the vernacular. His first biographer, J.M. Mackail, believed this to be his most significant achievement in shaping decorative taste.

The use of the Rustic for model housing must have seemed to the rural working classes like a parody of the environment from which it was designed to release them, and a satirical view of the social conscience that prompted this interest in rural architecture comes into novels by Jane Austen (*Northanger Abbey* and *Persuasion*, both 1817) and Benjamin Disraeli (*Coningsby*, 1844 and *Sybil*, 1845). The ten cottages making up Blaise Hamlet were built by J.S. Harford, a Quaker banker, for his retired servants. In *Villages of Vision* Gillian Darley remarks on the “dingy rooms” in the Holly Village cottages, Highgate, which were Baroness Burdett Courtt's picturesque exercise in philanthropy, also for retired servants. Rustic style model housing for employees would have little relevance in a history of interiors were it not for the circumstances under which many of these dwellings were equipped. Both inside and out they were repositories for past fashions, since the furniture and even the long out of fashion topiary and the plants in the garden were discarded from the great house. Some landowners, who had at considerable expense replaced a primitive rural slum with pretty old world cottages, felt able to insist that the inhabitants wore picturesque costumes to match.

The random mixture of 18th-century mahogany furniture with regional pieces and locally-made traditional joinery was discovered first by artists migrating to the country (the community at Witley in Surrey was particularly significant as a strand of artistic influence) and later by influential tastemakers like Gertrude Jekyll. The cottage garden was even more important as a hunting ground for lost species and the examples of the long-lost art of topiary inspired a revival.

With Sir Edwin Lutyens, Gertrude Jekyll can be described as the creator of the late 19th century rustic style. Their collaboration over her own house at Munstead Wood in Surrey exemplifies the rural ideal in all respects, both inside the house and in the carefully contrived surroundings, the theme of linked dwelling and garden which was central to the Rustic idiom. She published her discovery of the surviving country trades and crafts of her home county in *Old West Surrey* (1904), a book that was hugely influential on the vernacular style in the present century. This nostalgia became the basis for artistic interior decoration in the later 20th century; it was the leitmotif of the *House and Garden* look throughout the 1960s and 1970s, in which plain rooms were equipped with country furniture, folk pictures, antique engraved glasses and bits of

old pottery. It was to be exploited commercially with great success by Laura Ashley.

Although it went through many radical transformations and modifications, the Rustic or vernacular style never completely disappeared and it has now undergone a reappraisal and renaissance, with the idea of the village as a perfectly evolved social and ecological environment being explored once more.

S

Saarinens, Eero 1910–1961

American architect and designer

Eero Saarinen was born the son of the famous Finnish architect, Eliel Saarinen, and his achievements as architect and designer were equally celebrated. He was brought up in an atmosphere totally immersed in the world of design; his mother, Loja Saarinen, was a sculptor and weaver, and the family house in Finland was both a meeting place for other architects and designers and an influential exemplar of Arts and Crafts ideals. When the family moved to America in 1923, the Saarinens established a larger educational enterprise at Cranbrook, Michigan, and Eero matured in this cultivated and stimulating environment. In 1937 he joined his father's architectural practice and, as the 1940s progressed, Eero became the dominant force.

Eero's first exercise in furniture design occurred when he was only 20, when he designed some chairs for the dining room of the Kingswood Girls' School, a joint project that he worked on with his mother and father from 1929. He also designed some innovative seating for the Mary Seaton Room of the Streamline-Moderne Kleinhans Music Hall, in Buffalo where he and his father were the architects in 1938–40. But it was in 1940 that Eero made his real breakthrough as a designer when, in collaboration with Charles Eames, he won the two first prizes in the Museum of Modern Art furniture competition.

The Museum of Modern Art chair was made of sponge rubber laid on moulded plywood, using newly introduced techniques that enabled plywood to curve in two directions. The use of these techniques was a clear indication that Eames and Saarinen were designing for machine production, as opposed to the Arts and Crafts approach favoured by Eliel Saarinen. Charles Eames used the MOMA competition to launch his career as one of America's foremost designers of modern furniture. Eero Saarinen, however, worked primarily as an architect but he continued to design chairs throughout his life, some of which have become icons of mid-20th century Modernism. The *Womb* chair of 1948, for example, marked a turning point in contemporary design. Described by Saarinen as a modern version of the overstuffed club-chair model, it was a direct descendant of his 1940 prize-winning entry and had a curvilinear, organic shape with a large comfortable body supported

on thin metal legs. His *Deep Easy Chair* of the following year was, by contrast, more formal. The chair was produced for the lobbies of the General Motors Technical Center, near Detroit, and in it Saarinen abandoned the curvilinear forms of his earlier designs in favour of a precise geometry, but, as in his previous work, he retained a clear separation between the upholstered upper seat-section and the thin machine-made supporting frame. His 1955–57 pedestal furniture range, which included his celebrated *Tulip* chair, is more sensual, and deliberately blurs the distinctions between the upper sections and supports. The chairs and tables are shaped like wine glasses with heavy round bases, thin stems, and rounded moulded seats made of plastic or fibreglass. Their design illustrates Saarinen's interest in designing one-piece, sculptural furniture and their use of the innovative pedestal shape represented his attempt to rid interiors of the forest of furniture legs. His forms were also witty and whimsical, in marked contrast to the overly serious nature of much other modern design.

Saarinen's reputation as an architect grew considerably in the enormously productive years following his takeover of his father's practice in 1950. His first major independent architectural commission, largely completed by 1956, was the General Motors Technical Center. This vast complex of buildings represented the first realisation of the Modern Movement's promise of well-serviced, well-crafted machine-made buildings, both inside and out. The entire complex is organised on a five-foot grid, and this dimension is used for partition modules, suspended ceilings, luminous ceilings, office screens and so on to provide order and coherence to the overall design. By the 1960s these features had become commonplace in modern offices throughout the world but Saarinen's General Motors' buildings represent the first time they were employed. As a contrast to the uniform grid layout of the offices, the commission also included extravagant, glamorous staircases, often curving and usually hung from stainless steel rods, that reveal the more sensuous side of the designer's work.

The approach taken in the General Motors offices was applied with even greater sophistication in Saarinen's designs for IBM at Yorktown, New York, for Bell at Homdel, New Jersey, for John Deere at Moline, Illinois, and for other corporate headquarters. But he also gave free rein to the more organic side of his work in a series of curvilinear buildings of striking originality and power, the most notable of which were the chapel at Massachusetts Institute of Technology, the TWA

Eero Saarinen: *Tulip* chairs and tables for Knoll, designed 1957

Terminal at JFK Airport, New York, and Dulles Airport, Virginia.

The exterior of the chapel for MIT (1955) is a simple brick drum, but the interior is far more dramatic and inventive, with the internal face of the outer walls waving in and out. Natural light enters the building from two sources: through the walls, and through a circular rooflight, as in the Pantheon in Rome. The light from the roof floods down onto the altar through a Harry Bertoia sculpture made up of hundreds of small gilded plates which scatter the reflections like snowflakes. The chapel is one of the few satisfactory modern churches.

The use of curvilinear forms was taken a stage further in the TWA Terminal at Kennedy Airport (1956–62). All the forms are curved in an organic, as opposed to geometric fashion. Saarinen believed that curved shapes with gull-like wings would symbolise flight, and while the exterior is, perhaps, a little heavy for this idea to be completely successful, the effect in the interior is spectacular and almost magical with walls, windows, roofs, display boards, handrails – in fact everything except the floor – curving in a dream-like sequence.

Dulles International Airport, near Washington DC, completed after Saarinen's death, is much more disciplined than the TWA Terminal and is hence more convincing. It was the first all-jet airport and Saarinen was keen to employ advanced technology in both construction and functional innovation. Thus, the curved roof slab was poured integrally with suspension steel cables slung between sloped pylons, without the use of scaffolding, creating a clear span of nearly 170 feet. And the plan is simple and well-ordered as passengers are processed

through to mobile lounges to be driven to waiting planes. The great space of the terminal is an impressive and masterful interior and represented a fitting end to Saarinen's extraordinarily prolific and innovative career.

JOHN WINTER

Biography

Born in Kirkkonummi, Finland, 20 August 1910, the son of the architect Eliel Saarinen (1873–1950) and the sculptor and weaver Loja Saarinen (1879–1968). Emigrated with his family to the United States, 1923; naturalised, 1940. Studied sculpture at the Académie de la Grand Chaumière, Paris, 1929–30; studied architecture at Yale University, New Haven, Connecticut, until 1934; awarded the Charles O. Matcham Fellowship for travel in Europe, 1934–36. Married 1) Lily Swann, 1939 (divorced 1953); 2 children; 2) Aline Bernstein Loucheim, 1954: one son. Civilian consultant in the Office of Strategic Services, Washington, DC, 1942–45. Worked as an architect in his father's practice in Ann Arbor, Michigan, 1936–41; partner with his father and J. Robert Swanson, Saarinen-Swanson-Saarinen and Associates, Ann Arbor, 1941–47; partner with his father in Saarinen, Saarinen and Associates, 1947–50; principal of the successor firm, Eero Saarinen and Associates, Birmingham, Michigan, 1950–61. Designed furniture from c.1940; numerous designs for Knoll from 1946. Received numerous awards and prizes including two First Prizes with Charles Eames, Furniture Design Competition, Museum of Modern Art, New York, 1940; Grand Architectural Award, Boston Arts Festival, 1953; First Honor Award, American Institute of Architects, 1955 and 1956; Gold Medal, American Institute of Architects, 1962 (awarded posthumously). Fellow, American Institute of Architects, and American Academy of Arts and Sciences. Died in Ann Arbor, 1 September 1961.

Selected Works

Interiors

- 1938–40 Kleinhans Music Hall, Buffalo, New York (building, interiors and furniture; with Eliel Saarinen)
- 1938–40 Crow Island School, Winnetka, Illinois (building and interiors; with Eliel Saarinen; Perkins, Wheeler and Will)
- 1948–56 General Motors Technical Center, Warren, Michigan (building, interiors and furniture; with Smith, Hinchman and Grylls)
- 1953–55 Kresge Auditorium and Chapel, Massachusetts Institute of Technology, Cambridge (building and interiors with Anderson and Beckwith)
- 1953–58 Irwin Miller House, Columbus, Indiana (building and interiors with A. Girard and Dan Kiley)
- 1955–60 United States Embassy, London (building and interiors; with Yorke, Rosenberg and Mardall)
- 1956–62 Terminal, Trans World Airlines, Kennedy Airport, New York (building and interiors)
- 1957–63 John Deere Administration Center, Moline, Illinois (building and interiors)
- 1958–62 Dulles Airport, Chantilly, Virginia (building and interiors; with Ammann and Whitney)
- 1960–64 Columbia Broadcasting System Headquarters, New York (building; interiors completed by Florence Knoll)

Saarinens designs for furniture date from c.1940. His association with Knoll, the principal manufacturer of his designs, dates from 1946; his most well-known pieces include the *Grasshopper* upholstered lounge chair (1946), the fibre glass *Womb* chair (1948), and the fibreglass and aluminium *Tulip* chair (1957).

Saarinens, Eliel 1873–1950

Finnish architect and designer

The fifty year career of Eliel Saarinen can be divided into two parts. Practising in Finland for 25 years, he first established an international reputation based on his "National Romantic" and Jugendstil-inspired architecture. The second phase of his career began when Saarinen emigrated to the United States in 1923, after being placed second in the 1922 Chicago Tribune Tower competition. While practising in the United States, he also assumed the role of educator, first at the University of Michigan and then at the Cranbrook Academy of Art. Saarinen not only designed the Cranbrook complex but, under his stewardship, it became one of the most influential design schools in the nation.

In 1896, a year before Saarinen graduated in architecture from the Technical Institute in Helsinki, he joined with Herman Gesellius and Armas Lindgren to form the firm of Gesellius, Lindgren and Saarinen. At this time Finland was undergoing a period of national self-awareness, a nationalism founded on the desire to search out and understand traditional Finnish cultural origins. For the new firm, as for other Finnish architects and artists, the powerful, poetic imagery of the recently published *Kalevala*, the Finnish national folk epic, coupled with the interest in developing a national form of artistic expression, provided a profound source of inspiration for Finnish artists that resulted in a style known as National Romanticism.

National Romantic architecture was an adventurous, eclectic admixture of sources that included Finnish vernacular and medieval architecture, Continental Art Nouveau imagery, and the Romanesque-inspired work of the American architect H. H. Richardson. The massive granite volume comprising the Pohjola Insurance Company in Helsinki (1899–1901) was the firm's first truly National Romantic work, while their Finnish Pavilion for the 1900 Paris Exhibition established their international reputation. These works were characterized by picturesque plan composition, irregular building massing, tactile material vocabulary, and the incorporation of motifs and images from Finnish architectural history. Public buildings, such as the Pohjola Insurance Company and the National Museum in Helsinki (1901–11), are of granite construction with decorative ornamentation derived from Finnish nature or

folktales. Within the context of these works, we see Saarinen's strong and confident hand in the development of the interior spaces as well as the design of the furniture, textiles, and numerous other appointments. Explored through the most astonishingly wonderful watercolors, these designs for interiors, furniture, and details are revealed in their full impact.

Two villas, *Hvitträsk* (1901–04) and *Suur-Merijoki* (1901–03), exemplify his concept of a totally integrated work of art: a synthesis of art, architecture, and design facilitated by the close working relationship between designer, artist, and artisan. *Hvitträsk*, the studio house of Gesellius, Lindgren, and Saarinen, is an excellent example of Finnish National Romanticism. Located on a steep hillside outside Helsinki, the compound is organized around a courtyard within a series of terraced gardens. The complex is presented as a reinterpretation of Finland's vernacular past, and its picturesque massing is articulated with a rustic stone base and stuccoed or shingled walls; it has upper storeys of log construction, and is capped by a tiled roof. The interior spaces of the Saarinen house contain a variety of images and details: the great hall alludes to vernacular farmhouses, and a sitting area incorporates motifs from medieval churches; inglenooks and sleeping rooms are executed in an Arts and Crafts style. These spaces are furnished with appointments designed by either the Saarinens or their artist friends. *Suur-Merijoki*, a splendid country house located near Viborg, contains the best developed and most comprehensive interiors of his early career. The suite of watercolors produced for the design of the villa comprise a unique set of documents to access the architect's overall design process. A great many artists and artisans were engaged in the project, from inception through building. More than *Hvitträsk*, *Suur-Merijoki* contained a number of unique and particular individual interiors that exhibited a variety of origins.

The Gesellius, Lindgren, and Saarinen partnership lasted until 1905, when Lindgren left the group; Gesellius and Saarinen continued to practise together for two additional years. By the time his association with the two partners ended, Saarinen had moved beyond the stylistic limitations of National Romanticism. In the Helsinki Railroad Station (1905–14), a more classical and monumental spirit emerged: a balanced Jugendstil-inspired composition incorporating delicate concrete vaulted interior spaces. Symmetrical planning, combined with pyramidal volumetric massing articulated by strong vertical accents, which often included a dominant tower element, characterized Saarinen's work before World War I. His competition entries for the Palace of Peace in the Hague (1906) and the Finnish Parliament House (1908), as well as his designs for the town halls in Lappeenranta (1906), Joensuu (1909–11), Lahti (1911), and Turku (1911), are representative of the classical sensibility now informing his work. The furniture designs and interior decoration of this period assume a more classical and austere quality.

In 1923 the Saarinen family emigrated to the United States where his career would focus on education as well as architectural practice. Although his being placed second in the Chicago Tribune Tower competition (1922) is often cited as the reason for his move to the US, the economic conditions in Finland at this time prompted his departure. Saarinen was invited to join the architecture faculty at the University of Michigan in 1924,

and during that year one of his students introduced him to George G. Booth (1864–1949). It was from Booth that Saarinen received the commission to design the Cranbrook complex in Bloomfield Hills, Michigan.

Cranbrook, in particular the Academy of Art, was the manifestation of Booth's vision of a Midwestern institution that would facilitate the integration of the arts and crafts into contemporary culture. Under Saarinen's direction as president of the Academy and program head of architecture, Cranbrook became a nationally recognized school of design. The faculty included Carl Milles, Maija Grotell, and Marianne Strengell, in addition to the Saarinen family: Charles and Ray Eames, Florence Knoll, Harry Bertoia, Harry Weese, Edmund Bacon, and Jack Lenor Larsen are among the more noteworthy students. At Cranbrook, individuality and freedom were stressed and the sense of community was much more like the atmosphere found in the earlier *Hvitträsk* atelier.

At Cranbrook, between 1925 and 1943, Saarinen executed the School for Boys, the Kingswood School for Girls, the Academy of Art, the Institute of Science, the museum, library, faculty housing, and the resident artist's studios. These works ranged in style from the picturesque Boys School, to the Frank Lloyd Wright-inspired Kingswood School to the more austere classical Museum and Library complex. Within this stylistic diversity, the Cranbrook designs exhibit Saarinen's desire for totally integrated environmental works, realized through their excellent siting, exquisite masonry detailing, interior spatial treatments, and attendant furnishings and weaving. However, Cranbrook is more than an enclave of Saarinen buildings; it is a resonant environment incorporating sculptures, art work, furnishings, and decorative appointments designed and produced by the Academy's faculty and students, as well as by the Saarinen family.

In the 1930s and 1940s, as his practice expanded, Saarinen was involved in partnerships with his son Eero and J. Robert Swanson, a former student at Michigan. Representative works of the period include Goucher College Plan and Library competition (second prize, 1938, with Eero); Kleinhans Music Hall in Buffalo (1938–40, with Eero); Crow Island School in Winnetka, Illinois (1938–40, with Eero and Perkins, Wheeler, and Will, associated architects); First Christian Church in Columbus, Indiana (1939–42, with Eero); Smithsonian Art Gallery competition in Washington, DC (first prize, 1939, with Eero); and Wayne University Campus Plan competition (second place, 1942, with Swanson). Although these buildings and projects often include reflecting pools, towers, and excellent masonry detailing – hallmarks of Eliel's hand – their simplified cubic volumes, elemental plan compositions, and incorporation of horizontal strip windows indicate Eero's more Modernist influence.

Throughout his career, Eliel Saarinen was tied to the romanticism of 19th-century Arts and Crafts ideas. He was unable to incorporate Modernism's machine aesthetic into his work successfully, yet he remains an important and influential 20th century architect. The sensitivity of his furniture, interior designs, and architecture, and the perceptiveness of his planning ideas still provide excellent examples of how to make humane and memorable environments.

Biography

Gottlieb Eliel Saarinen. Born in Rantasalmi, Finland, 20 August 1873. Studied painting at Helsinki University and architecture at Helsinki Technical Institute, 1893–97. Married 1) Mathilda Gylén, 1899 (divorced c.1902); 2) Loja Gesellius, 1904: 2 children, designer Eva-Lisa and architect Eero (1910–61). Partner in architectural practice with Herman Gesellius and Armas Lindgren, 1896–1907; in private practice, Helsinki, 1907–23. Awarded second prize for his design for the Tribune Tower, Chicago, 1922; emigrated to the United States, 1923. Private architectural practice in Evanston, Illinois, 1923–24 and Ann Arbor, Michigan, 1924–37; practised with son Eero in Ann Arbor, 1936–41; partner, with Eero and J. Robert Swanson, Saarinen-Swanson-Saarinen and Associates, Ann Arbor, 1941–47; partner, Saarinen, Saarinen and Associates, Ann Arbor, 1947–50. Director, 1925–32, president, 1932–50, and director of the Graduate Department of Architecture and City Planning, 1948–50, Cranbrook Academy of Art, Bloomfield Hills, Michigan. Closely associated with the Friends of Finnish Handicraft, the Finnish Society of Crafts and Design, and the Finnish General Handicraft Society, c.1900–22; designed furnishings, textiles and interiors from c.1900; textiles for many of his interiors designed by Loja Saarinen from mid-1920s. Received many prizes and awards including Gold Medal, Architectural League of New York, 1933; Grand Cross of the Finnish Lion Order, 1946; Gold Medal, American Institute of Architects, 1947; Gold Medal, Royal Institute of British Architects, 1950. Died at his Cranbrook home, Bloomfield Hills, Michigan, 1 July 1950.

Selected Works

A complete catalogue of Saarinen's architectural commissions and interiors, and a chronology of his life, appears in Christ-Janer 1979. Collections of Saarinen's designs and furnishings are in the Museum of Finnish Architecture, Helsinki, and the Museum and Library, Cranbrook Academy of Art, Bloomfield Hills, Michigan.

Interiors

- 1901–04 Hvitträsk, Kirkkonummi near Helsinki (building, interiors and furnishings): Studio home for Gesellius, Saarinen and Lindgren; later the private residence of Eliel Saarinen
- 1901–03 Suur-Merijoki, near Viborg, Finland (building, interiors, textiles and furnishings)
- 1901–04 Hvittorp Haus, Lake Vitträsk, Finland (building, interiors and furnishings)
- 1905 Molchow-Haus, Mark Brandenburg, Germany (building, interiors and furnishings): Dr. Paul Remer
- 1905–14 Railway Station, Helsinki (building, interiors and some furniture)
- 1925 Cranbrook Educational Center, Bloomfield Hills, Michigan (building and interiors): George C. Booth
- 1925–30 Cranbrook School for Boys, Bloomfield Hills, Michigan (building and interiors): George C. Booth
- 1926–41 Cranbrook Academy of Art, Bloomfield Hills, Michigan (building and interiors): George C. Booth
- 1928–29 Eliel Saarinen Residence, Cranbrook Academy of Art, Bloomfield Hills, Michigan (building, interiors and furnishings; textiles by Loja Saarinen): Eliel Saarinen
- 1929–30 Kingswood School for Girls, Bloomfield Hills, Michigan (building, interiors and furnishings; textiles by Loja Saarinen)
- 1938–40 Kleinhaus Music Hall, Buffalo, New York (building, interiors and furnishings; with Eero Saarinen)
- 1938–40 Crow Island School, Winnetka, Illinois (building and interiors; with Eero Saarinen and Perkins, Wheeler and Will)
- 1940–43 Museum and Library, Cranbrook Academy of Art, Bloomfield Hills, Michigan (building, interiors and furnishings)

Saarinen designed numerous items of furniture, the majority of which were site-specific. His furniture collection for John Widdicomb (1930) was mass-produced. He also designed a full range of textiles in the early 1900s, later concentrating on *rya* rugs (from 1910). His silver and metalwork designs were produced in the Cranbrook workshops and by International Silver, Meriden, Connecticut.

Arthur Sanderson & Sons Ltd.

British manufacturer and retailer of textiles and wallpapers; established 1860

Arthur Sanderson & Sons Ltd. is one of a small number of English manufacturers and distributors of furnishings which were established in the 19th century and which, continuing to supply the upper-middle mainstream market, have gained a reputation for tradition and quality.

For the first 60 years, the firm's main business was in wallpapers. Sanderson & Ward is listed in a street directory of 1860 as selling stationery, fancy goods, music and paperhangings. Soon, Arthur Sanderson appears in Soho Square, moving in 1865 to Berners Street, which was to remain the home of the London showroom until 1992. At first the company simply imported and distributed French wallpapers, acting as agent for Bezault, Daniels and Balin. Imitation papers produced by Balin were used by the decorators Cowtan & Sons (whose record books are now in the Victoria and Albert Museum) in the late 1860s and 1870s, indicating that Sanderson imports were selling to the upper-middle-classes and the aristocracy. The same impression is given by a sample book of a similar date, showing prices of between 4s 6d (22 pence) and 16s (80 pence) per roll, a range comparable with other upper-middle market papers, those of Morris & Co., for example. But stylistically the French products are distinct, being, in the main, gaudy, crowded and textile-inspired. The company's output, when it went into printing on its own account in about 1880, was very different; there were many light and elegant two-dimensional Japanesque patterns conforming to English "artistic" or Aesthetic taste. But other fashionable types – Renaissance Revival scrollwork, faux tapestries, damasks, Arts and Crafts motifs and naturalistic florals – were also on offer. Designers in the 1880s and 1890s included Harry Watkins Wild, A.F. Brophy, C.F.A. Voysey and the Silver Studio.

Arthur Sanderson died in 1882, leaving the business in the hands of three of his sons: John took charge of sales, Arthur the showroom and Harold production. The small factory (for both hand and machine work) in Chiswick grew rapidly and by the late 1890s there was a staff of about 250. In 1899 Arthur Sanderson & Sons became a founder member of the WPM (Wall Paper Manufacturers), a powerful combine of the largest wallpaper manufacturers in the country, which was able to squeeze non-members, most of whom were smaller companies producing a high proportion of hand-work. Sanderson, with its own reputation for quality and with a large block-printing facility, was the obvious WPM member to acquire or absorb failing independents and took over, during the period 1900–40, some of the most respected names in the industry – Woollams, Knowles, Essex, Jeffrey, Heffer Scott and Morris.

It is not clear when Sanderson started its own studio, but by 1931 it was supporting a staff of about 17 in-house designers. Stylistically, its output in the first half of the 20th century reflects the main trends in middle-class decoration. Up to about 1910 there are many friezes both in the revival ("rose-and-ribbon" and classical) and late Arts and Crafts styles (the latter including nursery designs by Cecil Aldin and Will Kidd). A strong orientalising theme appears in the 1910s, continuing into the 1920s, alongside many all-over tapestry and verdure

effects in a softer colour range. The 1930s are dominated by beige, orangey-brown and green mottled effects, accompanied by striking geometric or floral borders.

The most important development of the period was the establishment of a textile printing factory. Sanderson had probably been displaying the fabrics of other manufacturers at its showroom since at least the 1870s but the opening of its own print works shortly after World War I gave an obvious advantage. Eton Rural Fabrics, as the firm's textile division was known, was run separately from the wallpaper facility (the split continued into the early 1980s) and its styling was, initially, more avant-garde, with a strong representation of modern Chinoiserie, French-inspired "futurism" and "Jazz" or "Bizarre" patterns. Mea Angerer was chief designer for a short while in the late 1920s and the fabrics of this date favour the abstract and colourful. Some patterns were produced as both textiles and wallpapers. But soon the range was expanded to include less challenging but cheerful florals and sturdy Jacobean. By the mid 1930s mainstream taste was fully represented by indistinct geometrics, many of them produced in Sanderson's new weaving shed. As was general at this time, designers well known outside the trade were not much involved.

After the manufacturing hiatus of World War II, Sanderson came, slightly late but very enthusiastically, to the modern approach which was such a feature of the period. The company mounted a number of exhibitions, among them Decorama 1956 which showed decorative schemes devised by Sir Hugh Casson and the staff and students of the Royal College of Art, and by artist-designers such as Edward Bawden and Humphrey Spender. The firm's 100th anniversary in 1960 was celebrated in style; the *Centenary Collection*, of both wallpapers and fabrics, included work by Frank Lloyd Wright, Gio Ponti, Spender and Raymond Loewy; five silk-screen printed fabrics were commissioned from John Piper as well as a stained-glass mural for the glamorous new showroom built by the architects Slater & Uren on the old site. The company inclined less towards the spindly "contemporary" than the "artistic", as demonstrated both by its own studio's output and by the very fine range of bought-in and outside-printed textiles (which included American-made examples by Picasso).

An innovation of the same date has outlived passing fashions; the *Triad* collections of 1962 onwards (*Options* from 1981) presented an identical or near-identical fabric and wall-covering alongside a quieter companion paper. Straight matching was not new, but Sanderson's achievement was to refine coordination and present it, ready-made, as a decorative practice to the middle market. It took a firm hold, moving into all consumer levels and becoming increasingly elaborate and sophisticated. Now there is greater variety in the "matches" and coordinating ranges also include woven fabrics, carpets, paints, bedding, made-up items and giftware.

Sanderson ceased to be a family firm in 1965 when, together with the rest of the WPM, it was taken over by Reed International. But in spite of several changes of ownership it has retained its identity. The company has always offered a choice of styles, but its "signature" is perhaps a large, naturalistic floral, sometimes employing scrollwork cartouches. The inspiration for this theme is drawn, indirectly, from 18th and mid 19th century printed textiles. Such patterns have become

Sanderson: *Rose & Peony*, printed textile, late 1980s

closely associated with the English Country House revival, a style developed by decorators such as Colefax and Fowler, and which became widely popular on both sides of the Atlantic in the 1980s. Not surprisingly, Sanderson's largest export market has always been in countries of the former Commonwealth, followed by South America, Europe and Scandinavia, but more recently the "traditional Englishness" of its products has been of great appeal in the United States and the Far East. Today, the company has also won international renown as the producers of many 19th-century wallpapers, hand-printed from the original blocks, which include most notably the designs of William Morris.

LESLEY HOSKINS

Selected Collections

The largest collection of designs and documentation relating to the history of Arthur Sanderson & Sons is preserved in the company's Archive in Uxbridge, Middlesex. In addition to examples of wallpapers and textiles, the Archive contains original art work, and miscellaneous business records and printed material. Further examples of the company's work are in the Victoria and Albert Museum, London, and the Cooper-Hewitt Museum, New York.

Further Reading

A comprehensive history of Sandersons was published by the company to accompany an exhibition commemorating 125 years of trading and appears in Woods 1985. Additional references can be found in surveys of the history of wallpaper, the most recent being Hoskins 1994.

Santa Fe Style

The Santa Fe Style, or Southwestern Style, is a 20th-century form of interior design and decoration derived from the southwestern region of the United States. This geographical area encompasses the states of New Mexico, Colorado, Utah and Arizona, with its influences overlapping into the neighboring states of Texas, Nevada and California. Several key factors

have contributed to the rise of this style: the region's dramatic natural environment, popularity as a tourist destination, and three distinctive ethnic populations. The mingling of Native American, Hispanic and Anglo cultures has produced an extremely popular and influential design style. Santa Fe Style, named after Santa Fe, New Mexico, one of the oldest established towns in the US, and one with a rich and well-preserved architectural heritage, originated because of its unique combination of ethnic sensitivity to colour, surface textures, proportions and integrated materials.

As more people visited the Southwest, interest grew in the region's attractive lifestyle and decorative features – Southwestern-styled furnishings became highly exportable. Santa Fe Style was repeatedly featured in popular periodical literature, particularly as its interior effects were adopted by Hollywood celebrities and other wealthy, influential Americans. Lavish colour layouts were featured in such popular US magazines as *Architectural Digest*, *House & Garden*, *Southwest Passages* and *Southwest Art*. Movies, television and popular literature have also enhanced the style's appeal. Decorating in this mode became a viable and fashionable alternative. Distinctive regional modes of decoration, from Hispanic folk crafts to Native American textile patterns, have crept into diverse commercial products, from Ralph Lauren goods to those featured in the L.L. Bean mass-market mail-order company's catalogues. Knowledge and interest in the Santa Fe Style grew more established throughout the 1970s and 1980s; by the early 1990s, Southwest-style furniture alone had become a \$1.5 billion industry.

The origins of the present Santa Fe Style came in the late 19th and early 20th centuries, as Anglo emigrants to the region integrated their interior furnishings with those from the resident Indian and Hispanic cultures. An influx of educated and affluent Anglo newcomers, many of them artists and writers, not only brought the Arts and Crafts Movement to the region, but revived designs they admired from the older Anasazi cultures and modern Pueblos. An example of this early integration of decorative features can be seen in the interiors of the 1927 Nicolai Fechin home, in Taos, New Mexico. Antique Spanish colonial furniture was particularly prized but recent studies by furniture conservators, as reported in the 9 October 1994 *New York Times*, have revealed that the predominant pale pastels of the Santa Fe Style may have been a misunderstanding by Anglo settlers and other Easterners. Those Spanish Colonial pieces, the original inspiration for much of the style's look, may have been brightly painted, as in contemporary Mexican craft work, but became bleached by sun and climate. The resultant aged and faintly tinted furniture became the accepted aesthetic of the Santa Fe Style.

The appellation "Santa Fe Style" had already been given to a form of early 20th-century architecture. While the Mission Revival was popularized in the Southwest from 1895 to the 1930s, the indigenous building style inspired early 20th-century architects such as Isaac Hamilton Rapp (1854–1933) – often called the creator of the Santa Fe Style in architecture – John Gaw Meem and Mary Colter to create seminal buildings that paid homage to the local house-type; buildings were meant to harmonize with their natural settings. Houses were most often constructed from adobe, in earth-toned colours, low-scaled and horizontal with strong geometrical lines, and

flexible in their three-dimensional massing. Vigas, or beams as embedded poles, carried structural weight, and became an important design element. Santa Fe was home to many of these pioneering structures.

Consequently, resolutions in interior design and decoration were shaped by the nature of existing architectural space. Current specific interior effects evolved from an amalgam of decorative elements. The sparse furnishing of early Pueblo and Colonial homes is balanced by the modern predilection for collecting, especially art and craft works. Interior walls are often whitewashed, left with a natural surface, or painted in clear pastel colours. Detailing is often meticulous, in an effort to mirror the overall architectural form of a room. Plaster can be textured to approximate adobe. Warm colours and bold geometrical patterns are mixed. Usually, the overall appearance of a room is deliberately eclectic; for interiors, the Santa Fe Style is most notable for combining comfortable furniture, organic colours, dramatic textiles and distinctive craft objects. Some well-known designers include William Tull (Scottsdale, Arizona), Waldo Fernandez (Los Angeles) and the Santa Fe firms of Charles-David Interiors and Kailer-Grant Designs.

Southwestern furniture is made in a wide variety of styles, ranging from traditional Spanish Colonial, Mission, and Arts and Crafts to New Wave Cowboy. Such furniture can be designed by fine artists, architects or interior designers. Santa Fe Style furniture can be characterized by the following common elements: they are usually made of wood, hand-crafted, painted or given an "aged" finish, couches and chairs are overstuffed or furnished with soft pillows, and most pieces are decorated with painted or carved Southwestern symbols or motifs. While some decorative markings have been overcommercialized, such as cactus and coyotes, many designers incorporate artistically appealing indigenous images, like Anasazi "Kokopelli" flute-players, and Mimbres culture animals and figurines. Popular furniture works are reinventions of the *trasteros* (cupboards) and *cajas* (chests) of the colonial craftsmen. One landmark designer, Thomas Molesworthy (1931–77), and his Shoshone Furniture Co. of Cody, Wyoming, created prototypical Cowboy and Ranch style pieces much imitated and reworked in recent years. Current companies, like Arroyo Designs (Tucson, Arizona), Doolings of Santa Fe, and Taos Country Furniture offer furniture in either Postmodern or Revival variations on these themes.

The utilization of art and crafts within interior decoration is an important contribution to the Santa Fe Style. The Southwest is especially rich in its diversity of local arts, and in the last several decades the market for such items has become international. Popular textile combinations, often approximating the strong geometric patterns and borders of kilim-type weavings, are: Navajo (weavings from regional production centres – such as Chinle, Ganado, Two Grey Hills – and styles such as Storm Pattern, Sand Painting, Yei), Mexican Zapotec Indian weavings, and traditional Rio Grande Hispanic weavings (e.g., Chimayo). Frequently displayed Hispanic crafts are carved *santos* (saints) and *bultos* (figurines), *retablos* (painted panels), tinsmithed candelabras and wall sconces. Pueblo pottery, regional folk art, ethnic crafts from other countries, large scale, colorful contemporary paintings – many by or about Native Americans – are combined within a room. The Santa Fe Style, as pictured in magazine and book layouts, is particularly effective

in its striking use of art and craft objects in spatial areas, such as entryways and vestibules.

Despite the integration of antique and revival elements, the overall interior look is usually very contemporary. The Santa Fe Style's development in the last two decades shows a strong trend toward minimalist rooms with expansive space, architectural integrity and maximum dramatic effect. The rich blend of cultures and natural influences promotes diversity in interior decoration.

The increase in serious ethnographic study during this period has assisted the revival process, making design elements more accurate and varied. Literature referring firmly to this development as Santa Fe Style is quite recent and not totally consistent: some magazines and general books refer to a "Southwestern Style." However, the movement of this distinctive mode from a regional to national phenomenon can be seen throughout the United States interior design and decoration industry.

Scagliola

"There is", wrote the compiler of *The Builder's Dictionary* (1734), "a Sort of artificial Marble made of Gypsum ... which becomes very hard, receives a tolerable finish, and may deceive the Eye". He was referring to *scagliola*, the decorative finish which was at the time a relatively new importation to England, although it was already in use for altars and architectural elements in other European countries. Evidence is scanty, but it is believed the technique was probably known to Antiquity; if so, it appears to have been re-invented around the turn of the 16th–17th century. Traditionally the credit for this has been given to Guido Fassi del Conte of Carpi, a small city north of Modena which certainly became a centre of *scagliola* decoration; but there is reason to believe that Blasius Pfeiffer's elaborate work in the Residenz, Munich, might slightly predate Fassi's although the competition is close. Bavaria, as well as Italy, was to prove fertile soil for *scagliola*, which derives its name from a chip or flake (*scaglia*), and in effect it consists of fragments of marble embedded in coloured plaster and employed in the making of decorative architectural elements such as columns, or as parts of tables and cabinets, as wall covering or as flooring.

An early use in England was as surrounds and window sills

at Ham House in the late 17th century, but these were probably imported from Italy. William Adam reported in 1724 that “my Lord Burlington has done the floors of some of rooms with (stucco) in imitation of marble”, and two years later the Marquess of Annandale recommended Lord Hope, who was in Italy, to “inform yourself about the Huno and Scalliolly which are coming into fashion in England for floors and ornamenting of rooms”. “Artificial marble” was referred to in a payment to Francesco Vassalli for work at Castle Howard in Sir John Vanbrugh’s Temple of the Winds in 1736–37. Henry Flitcroft’s Palladian Great Hall at Wentworth Woodhouse, with its superimposed storeys of yellow Siena fluted Ionic columns and Corinthian pilasters with white capitals and bases, and a *verde Antico* surbase, was designed about 1732, but it took a long time to complete; more than thirty years later “skilful hands from Italy” were said to be “kept constantly finishing this noble design”.

Chambers’s Cyclopaedia of 1738 describes how to make elaborate plaster mosaics, but concludes: “If it be only required to make a variegated table, or other work of several colours ... they ... prepare separately, in large bowls, as many different colours as nature shews in the marble to be imitated, and after incorporating them with the gypsum and glue-water, they take a truel-full of each, and dispose them in a trough, without any order; then, without mingling them, and only by cutting or crossing the gypsum of each truel once or twice with each of the rest, they give them that beautiful confusion, for which natural marbles are so much valued; Of these they then make their tables, or lay a mold, according to the work to be done”.

In his *Complete Body of Architecture* (1756), Isaac Ware writes that “In elegant houses ... floors are made of stucco, that is, of plaister of *Paris* beaten and sifted, and mixed with other ingredients. This may be coloured to any hue by the additional matter, and when well worked and laid makes a very beautiful floor, some of it looking like porphyry”. He notes how often such floors in England cracked, “partly through ignorance, and partly through carelessness (yet) stucco floors are very common in many parts of *Europe*, particularly at Venice, where it is rare to see a crack among a thousand of them. This is more owing to the thorough tempering and working of the material, than to any secret in the composition”. Nevertheless, a certain amount of mystery has surrounded the techniques, which seem to have varied from stuccoist to stuccoist, and no doubt there has been a tradition in some families of handing down guarded formulae.

When James Adam was in Italy in 1760 he observed “the *scagliola* is curious, and could be used to answer different purposes, for columns representing various marbles, for tables representing mosaic work, and for most elegant floors for baths and low apartments, or for linings to any place damp, etc., and likewise for imitating different marbles in cabinet-work and such like things”. There were various recipes for *scagliola* circulating around this time and an obvious curiosity about it. Sir William Chambers, who had doubtless made enquiries about it when he was in Italy, wrote out a recipe in 1767, noting that “the Italians give what colour they please by mixing with the paste Brown, Red Vermilion, Yellow Occar, or any colour that agrees with Lime”. On another occasion he recommended a London firm, Richter and Bartoli, “who imitate almost any Sort of marble You please & also make very

beautiful Ornaments of it”. John Richter took out a patent in 1770 for “my invention of ‘an Art or Method of inlaying *Scagliola* or Plaister in and upon Marble and Metals to imitate flowers, trees, fruits, birds ... and all sorts of ornaments””.

Bartoli made the Ionic door pilasters in the Saloon at Kedleston Hall, and he also worked for Robert Adam at 20 Portman Square; maybe James’s interest in *scagliola* when he was in Italy was influential in the brothers’ increased use of it, not only for columns, but in table tops, as at Nostell Priory and Northumberland House, and in fireplaces at Strawberry Hill and Northumberland House, when delicate *scagliola* ornaments were inlaid in white marble. Their outstanding use of the material is in the Anteroom at Syon House (1761). Antique *verde antico* columns brought from Rome were incorporated in the design of this great Neo-Classical room, but the pilaster responds were made of *scagliola* to match. It appears that at least one of the columns was also made in the same way, either in Italy or England, to make up the required number. The famous multi-coloured *scagliola* floor in the Anteroom was apparently relaid in 1831–32 by the Coade firm which also supplied *scagliola* to Buckingham Palace and York House, among other London buildings, in the early 19th century.

The comparably great Neo-Classical room in which the material was used is the Hall at Heveningham Hall where James Wyatt was working in the 1780s. He had already introduced *scagliola* for yellow Siena columns in the Pantheon in London (1769–72) and in the Saloon at Heaton Hall (c.1772–89), and he was to continue using it in many more houses before his death in 1813; but at Heveningham he reveals not only his own mastery of decoration but also the manner in which *scagliola* could be incorporated as an integral part of a total design rather than being simply a simulation of marble. The combination of the yellow Siena columns and pilasters with the white capitals and the subtle shades of apple green on the walls and ceiling, the whole united by the darker tones of the gridded floor which binds the composition together, created a masterpiece.

The other architect members of the Wyatt family also made extensive use of *scagliola* in their Neo-Classical interiors, especially James’s son, Benjamin Dean, and his nephew, Jeffry (Sir Jeffry Wyatville). The former used it at Apsley House, the Oriental Club and Crockford’s, and at York (later Stafford and then Lancaster) House with its magnificent staircase, “the walls, galleries and columns rising with a highly polished surface from the floor to the ceiling”, as an anonymous writer described it in an article in the *Builder* in 1863, which usefully gives many examples of buildings in which *scagliola* was used – “executions of a first-rate order”. The same writer gives a great deal of information about the method by which columns and pilasters are built up and the methods by which *scagliola* can be produced in every variety of shade and colour; in every imaginable pattern and diversity of arrangement; and in an almost unlimited manifold change of form and size, from a lady’s brooch to the superficial area of a large flank of wall”.

Although the technique remained popular throughout the 19th century and was described fully in William Millar’s standard *Plastering Plain and Decorative* (1893), it fell out of favour with the changes in architectural taste, and there was no reference to *scagliola* in the 1927 revised edition. The skilled craftsmen were dwindling, and there was little demand in

England for their services; but after World War II the techniques had to be relearned in the reconstruction of bombed European buildings such as the Royal Castle in Warsaw and the Semperoper in Dresden, in which the quality of workmanship was equal to that in the great days of what a writer to the *Builder* in 1845 called “this truly beautiful art”.

Scandinavia

Introduction

A fully developed craft tradition can be traced in Scandinavia in Viking grave finds, which contained furniture for ships. After the Viking period, two cultural patterns – affecting on the one hand Norway and Denmark, and on the other Sweden and Finland – can be discerned, which, though weakening over the centuries, continued to survive. Norway and Denmark, the former Danish areas of Skåne, Hålland, Blekinge and Bohuslan, were strongly influenced by, and themselves influenced, England and Western Europe. Sweden and Finland, united as a kingdom from the 13th century, formed contacts with Byzantium along the Eastern trade routes; these were replaced by the Hanseatic League and the Teutonic Order's cultural dominance in the Baltic.

With the introduction of Christianity, both political power and the scale of the monarchy were to change significantly the conditions for cultural production, and during the medieval period the Catholic Church became the intermediary for the

introduction of general stylistic influences from Western Europe among leading patrons in interior design.

During the Viking and early medieval periods Norway became the most flourishing cultural centre in Scandinavia. Alongside its burgeoning trade and fishing industry it developed a singular wooden architecture in the form of stave churches, which often had richly sculpted decoration. Later stone cathedral buildings were also notable, such as Trondheim Cathedral, which already by the 13th century followed an English cathedral pattern.

At the end of the 14th century the Scandinavian countries were unified in the so-called Kalmar Union. Norway ceased to be part of the Swedish kingdom. Until 1814 Norway and Denmark were united, with the sovereign seat in Copenhagen. After becoming Christian in the 12th century, Finland was united under the Swedish crown until it was lost to Russia in the 1808–09 war. Only in 1917 did Finland become a sovereign state for the first time.

The development of design in Scandinavia from the Middle Ages until the beginning of the 19th century is best approached by looking historically at Sweden with Finland and Denmark with Norway. From the 19th century, until Norway separated from Sweden in 1907 and Finland from Russia in 1917, the story is mainly one of the striving for national identity. Developments during the 20th century have given design in each of the four countries its own individual character, especially Danish and Finnish design.

Even if single pieces of furniture or fragments have survived from the Viking period – mainly in the form of Norwegian archaeological material displaying a highly refined level of craftsmanship with animal ornament – today it is mainly from ecclesiastical buildings and their collections that an image of Scandinavian interior design before the Renaissance and the emergence of a secular culture during the Reformation at the beginning of the 16th century can best be reconstructed.

During the Catholic church's last dominant period at the end of the Middle Ages, Scandinavia, like other countries around the Baltic, formed part of a general Northern European culture which was spread by the monasteries and the bishoprics. A secular building culture with its roots in the Teutonic Order developed around the bishops' palaces and fortified castles.

Within its geographical area Scandinavia displays great local differences, with, on the one hand, cities and rich monasteries with buildings in natural stone or brick along the coasts and accessible inlets, and on the other, inland areas with a continuous tradition in the form of both stave churches and dwelling-houses. Ancient traditions endured in Finland and central Sweden, and especially in Norway, where stave churches were built in the same way for hundreds of years, even preserving Viking techniques and ornamental forms with dragons and animal shapes. Timbered churches and houses from the 13th century survive in Norway, Sweden and Finland as living examples of a continuous tradition which goes back to the pre-Christian period. By contrast, in the areas closer to the continent, in Denmark and southern Sweden, half-timbered buildings and clay-built buildings bear witness to the links of their building traditions with the Baltic's northern areas in Poland and Germany.

Until the first half of the 17th century, Denmark was the

most significant intermediary for Northern European ideals. A Netherlandish Renaissance architecture with its associated aspirations in interior design developed, and commissions from Brussels and Antwerp, Northern Europe's foremost craft centres, were combined with patronage which brought in Flemish tapestry weavers, painters, sculptors and intarsia workers. Denmark's dominance during the 16th and beginning of the 17th centuries was matched by Swedish royal building programmes between 1540 and 1580. The development from medieval to Renaissance styles can be traced over a number of decades at Gripsholm Castle, which was begun in 1537, and Vadstena, which reflects the impact of the Italian Renaissance on architecture and fortification, and thereby also on new domestic architectural forms. Sweden's liberation from Danish dominance from the 16th century was the result of Gustavus Vasa's (Gustav I) creation of a self-sufficient monarchy at the beginning of the 1520s. During the following two centuries this resulted in fierce enmity between Denmark and Sweden, with alternating shifts in the balance of power during the long wars which ended only with the peace of 1721.

The building work undertaken during the 1520s to the 1550s on Gustav I's castles and fortresses at Gripsholm, Vadstena and Uppsala continued under his sons' reigns, with the rebuilding of other castles and fortifications, such as Kalmar, Åbo and Stockholm Castle. The latest fashions are most clearly visible at Kalmar Castle, where some impression can still be gained of the luxuriousness of the interior decoration. Rooms contain a rich array of intarsia panels and painted and sculpted coffered ceilings, as well as stucco work displaying the influence of the Italian Renaissance via the artistic centres of Poland, north Germany and the Netherlands.

Only a few indigenous tapestries with figure subjects, as well as single pieces of sculpted and intarsia-inlaid furniture, have survived in Sweden. In Denmark, however, artistic development was much richer until the Thirty Years' War, but during the 1630s the balance of power began to change. From the mid-1640s Sweden became the most territorially aggressive nation in the whole of Northern Europe and claimed back the former Danish provinces of Skåne, Blekinge, Hålland and Bohuslän. Since then these provinces have become integrated with Sweden, but even today elements of Danish culture are evident in their building and interior design.

The cultural turning-point which came with the Thirty Years' War increased the artistic ambitions of Sweden, and during the second half of the 17th century the creation of town palaces and villa-like buildings with parks was given high priority. Roman architecture suited the Swedish belief that the Swedes were the descendants of the people who had conquered the Roman Empire. The villas and palazzos created by the 16th-century Italian architect, Andrea Palladio, and adapted in the architecture created for Louis XIV in Paris, became the models for a short but magnificent period of luxury consumption during the 1680s.

During the reign of the Dowager Queen Hedvig Eleonora a number of large castle-like manor houses were constructed around the country, with symmetrically placed wings and long avenues running through the landscape. The Dowager Queen's greatest castle project was Drottningholm Palace, which was created in the 1660s after designs by Nicodemus Tessin the Elder.

Sweden

The history of secular interior design in Sweden can be traced to the end of the 13th century when the use of bricks was introduced and the building of stone houses on royal estates made it possible to create palace-like buildings. Thirteenth-century brick houses survive both in Östergötland and in the Malar valley. The Folk-Kings' palace in Västenede was discovered during recent restorations to buildings added to the monastery and to the hospital. Traces of lime painting of a type similar to that found in churches, and traces of decoration surviving in built-in wall cupboards have enabled a reconstruction of the lost decoration. Vaulted rooms and ceilings with visible beams have been restored according to the room's character and function.

In the cities that flourished with the development of the Hanseatic League, stone houses were also built by burghers and wealthy merchants. In Visby gabled houses in limestone have survived more or less unaltered. But the earliest interiors date from the end of the 15th century. A fortified stone house on Glimminghus in the then Danish Skåne has survived almost intact. The fixed interior details are distinguished by built-in open fireplaces and fireplaces with chimneypieces in carved limestone or sandstone, and fixed built-in benches in the deep window recesses. A built-in limestone table-top for a stone trestle is the oldest preserved item of furniture. The owner of the house was the Danish nobleman Jens Ulfstand, and it is likely that Adam van Düren, the talented sculptor and architect who was also active at the cathedrals in Lund and Linköping, worked on the building.

However, it was only with the Reformation that secular interior design really began to develop in Sweden, principally through royal initiatives. Materials from monasteries were reused by Gustav I for the building of Gripsholm Castle, around 1537. The oldest preserved artistic interiors date from the beginning of the 1540s. A coffered ceiling created in 1543 in the shape of alternating square and hexagonal coffers framed by mouldings in grey, red, and blue, has been attributed to the painter Anders Larsson. Engravings by Heinrich Aldegrever, a German graphic artist, provided the models for the faces of the figures and the elegant trailing decoration, and even the medieval-style lime-paintings on the walls and vaults may be contemporary.

German influences persisted until Gustav's death, but with the ascendance of his son, Erik XIV, new artistic impulses from the Netherlands, with more developed Renaissance forms, came to prominence. Despite extensive restoration work during the mid-19th century, Erik XIV's chamber at Kalmar Castle remains the supreme example of a royal luxury interior during the latter part of the 16th century. The chamber has tall panels decorated with architectural frames and cartouches, and landscape scenes in intarsia in light, dark and coloured woods. Similar work of roughly the same date exists in northern Italy, and the aim was to create a *studiolo* like those that had been created for Italian dukes from the end of the 15th century. Above the Italianate panels and up to the ceiling the walls are completely covered with polychrome sculptural stucco friezes depicting boar-hunting scenes. By contrast, the models for the vaulted window recesses were Netherlandish engravings and cartouche frames, which give the chamber a

more modern appearance. In one of the cartouches there is a classically modelled figure of Hercules, probably the latest painted addition to the room.

Under Johan III, who was crowned after Erik's murder in 1569, interior design adopted a clearer Italian character at the expense of the older German influences. Johan III's interiors at Kalmar Castle are considered to be the foremost in Sweden during the third quarter of the 16th century.

During the later 17th century (the Caroline period), Swedish ambitions followed precepts and ideas adopted in Parisian interiors from the 1660s. These lay behind the widespread fashion among the country's nobility to acquire rich textiles for wall coverings, beds and table covers. Ready-made furniture was imported from Paris, Antwerp or Amsterdam via Hamburg. New buildings and additions to existing buildings required both technical skill and artistic talent, especially for the execution of stucco work and paintings. The Chancellor Magnus Gabriel De la Gardie was an important patron of the period, building castles, churches, manor houses, schools and hospitals, and providing layouts for new and existing towns in various locations throughout Sweden and around the Baltic. Like many patrons, he was often closely involved in the decision-making processes for many of these projects, and his library and collection of engravings were frequently used as artistic resources, particularly by painters, sculptors and woodworkers. Stucco-workers appear to have followed their own decorative designs, but could also work after architectural drawings. Stucco work was in the greatest demand, after which came painted decoration on wood or linen, or a combination of the two.

Nicodemus Tessin the Elder's (1615–81) artistry is intimately linked with that of the architects Simon De la Vallée and his son Jean. Together they laid the foundation for Caroline architecture, with its roots in 16th-century Italy, and incorporating French and Dutch classicism.

The change from visible brick to plastered façades occurs in the 1650s in an increasingly Roman style, and from the 1680s Nicodemus Tessin the Younger (1654–1728) was its leading exponent. The common ground-plan and room decoration inherited from the first half of the 17th century was additive and executed by different craftsmen, that is to say, by woodworkers, stone-sculptors or decorative painters. This was transformed under Tessin the Elder's direction, so that all the decoration was carried out according to the pattern book assigned by the architect, or after his own designs. The etchings of the French ornament designer Jean Le Pautre included Roman leaf shapes, such as acanthus leaves, fruit bunches and cartouches, and could be produced in stucco on ceilings or painted on linen in grisaille against coloured backgrounds. Thoroughly worked-out ground-plans, with symmetrically arranged rooms and architecturally divided wall panels became common. The painted, beamed ceiling disappeared, and towards the end of the century a new French Baroque taste became increasingly apparent, with fresh decorative sources derived from, among others, Jean Berain. From the time of the Caroline autocracy's rise to power, nearly all of the country's artistic activity was transferred to public building works, since the higher aristocracy's power and resources were curtailed by the state.

From the 1690s the modernization of Stockholm Palace

began with the influx of French sculptors and painters such as Jacques Fouquet, Bernard Fouquet, Jacques de Meaux and others. In 1697 most of the Royal Palace burned down, but the major part of the north range, which had been under construction since 1693, was saved. Within a few years work was begun on an even larger palace building. Charles XI had died shortly before the fire and the new king, Charles XII, was scarcely fourteen years old on his accession to the throne. The long-lasting period of war which followed for the next twenty years delayed the palace's completion. After 1709 work was halted until 1728, when building work began to gain pace, and in 1754 the royal family were able to move in.

Tessin the Younger, who created both the exterior architecture for the palace and the projects for its interiors, died in 1728. His son Carl Gustaf Tessin (1695–1770) took over responsibility, though Carl Hårleman (1700–53) acted as artistic director. Hårleman was closely in touch with the most up-to-date French stylistic developments through long study trips and visits in France, and it was his responsibility to adapt Tessin the Younger's designs to the latest Parisian fashions. Original French drawings were acquired, as well as copies of what was being produced in France. New groups of artists were summoned to Sweden, both to carry out work and to direct the training of Swedish pupils at the Stockholm Palace building workshops. A drawing academy was founded in 1737, and, with its six hundred rooms requiring decoration, the palace became a nursery for different artists and craftsmen. This resulted in craftsmanship on an international level which was to transform the entire artistic development for the rest of the century, principally in Stockholm, but also throughout the country. During the Gustavian period of the later 18th century, the lessons learned at the palace yielded results in craft knowledge which spread to other counties in the kingdom and resulted in interiors and furniture in increasingly classicising forms.

The most innovative trends in more ordinary domestic interiors during the 18th century came about as a result of Fabian Wrede and Carl Johan Cronstedt's invention of the tiled stove in 1767. In just a few years knowledge about how homes could be heated more effectively through the walling in of the chimney flue spread throughout the country. Open fires were taken out and tiled stoves with flues were installed in almost all the older Swedish homes that required heating throughout the year. Rooms that hitherto had remained unheated during the cold season could now be used all year round, and new furniture forms such as sofas and armchairs began to develop. Only then did the size of the house begin to correspond to the size of its living rooms. Nevertheless, the Baroque interior's legacy of a few ceremonial rooms, with the rest of the house given over to cold store-like fine rooms, persisted until the mid-19th century among the landed gentry, who often held to 17th- and 18th-century manor house ideals.

By the mid-18th century the glazed tiled stove had become a complement to the open fireplace, especially in cities. Generally tiles were decorated in relief in black, green and other colours. Such stoves still remain at Skokloster, and archival sources suggest that in aristocratic palaces they were also common, particularly in smaller rooms. It was not until the resurgence of building in Sweden during the 1720s and 1730s that blue and white as well as green stoves became usual

Scandinavia: blue anteroom, Sturehof, Sweden, 1708

in the royal palaces. At Ulriksdal Castle a great series of green glazed rectangular tiled stoves with twisted columns at the corners were set up in the smaller attendance rooms. A number of these still survive on the attic floors of the wings, and a stove decorated in blue on a white ground, dating from around 1730, survives in the main apartment of the palace, although in a much altered state.

After Hårleman's death in 1753, there were increasing numbers of commissions for palaces and grand houses. Carl Johan Cronstedt took over the direction of the superintendent's office and the completion of the interior decoration of the Royal Palace in Stockholm. Cronstedt's artistic direction is best illustrated in the interiors for the Royal Library in the north wing, which has large balconies and walls with fluted pilasters and columns as its principal decoration. Otherwise it is difficult to detect a renewal of stylistic trends after Hårleman's death, since most of his commissions were shared with assistants such as Jean Eric Rehn and C.F. Adelcrantz.

Rehn's (1717–93) interiors became increasingly influential during the 1750s and were distinguished by a sober, gracious ornamental style including features derived from nature rather than from traditional heraldic devices. Initially he favoured flower swags, laurel wreaths and *rocaille* motifs, but during the following decades his work owed more to the example of French classicism.

After the Royal Palace, Stora Wäsby manor house in Uppland is Rehn's most important interior commission in a clearly Rococo style, and was completed around 1760. His most characteristic feature is his use of glazed stoves as part of the interior; these stoves wholly altered the building's function and appearance. Even for the most ornate room at Stora Wäsby, the Salon d'accompanier, and in Count De Geer's silk-covered bedroom, Rehn designed blue, flat-tiled stoves on iron bases decorated with the proprietors' heraldic shields within a wholly planned composition.

During the late 1750s and 1760s the interiors of the state apartments within the manor house of Sturefors in Östergötland were renovated after Rehn's designs. These consisted of new carved panels, tiled stoves and decorative painting on the linen-covered walls. The earliest interiors including classicising decoration appeared in 1760, when imitation gilt bronze ornaments against white panels were used in Count Bielke's study. The chair backs of the furniture specially made for this room also reflect the first traces of the so-called Gustavian style. However, the decoration of this room appears to have had more to do with the study's function than with changes in fashion, and in the more intimate female quarters of the household, such as Countess Bielke's Chinese cabinet which was created c.1765, at around the same time as the Chinese Pavilion at Drottningholm, a more developed Rococo style is employed. From the end of the 1770s monochrome woodwork in a greyish-white colour dominates the whole household. The use of colour is confined to the wall-panels and textiles, and the various forms of decoration used for the tiled stoves. Gilding and bronze accentuate the dignified status of the rooms.

Rehn's significance for the 18th-century interior is exceptional. After his return from a study trip to France and Germany in 1754–56 he was responsible for almost all the major Swedish interiors until the beginning of the 1780s,

including those in the Stockholm Royal Palace, at Drottningholm Palace and the Chinese Pavilion, as well as new interiors for older houses and new manor houses. As Carl Hårleman's assistant at the Royal Palace he had executed the drawings and watercolours for the newly designed rooms in the Crown Prince's apartments on the first storey of the palace's north front, as well as those for Drottningholm Palace, which Lovisa Ulrika had received as a mourning-gift in 1744. The modernization of these rooms continued throughout her period of ownership until Gustav III purchased the palace for the state in 1776. In all these works, Rehn moved increasingly towards a more sober French classicism, which derived initially from Baroque traditions, but which from the 1770s developed a Louis XVI character, with artistic precedents in Neufforge and Delafosse.

Rehn's first purely classical work was the interior of Gustav III's state bedchamber at the Royal Palace in Stockholm dating from the beginning of the 1770s. French classical interiors were mainly in white and gold, and preserved the room's form and vertical lines, but Rococo elements on ceiling mouldings and other details, for instance, were introduced in the form of sculpted and painted elements. Laurel festoons and urns replaced mussel ornament. Meandering borders and Greek-key patterns which had been in use since the 1750s, together with columns, pilasters and beading, gave the room a cooler and more ceremonial character in the Gustavian spirit. At Övedskloster in Skåne examples of Rehn's most developed early Gustavian interior designs can be found in the saloon and gallery, which include heavy consoles under the mirrors placed between the windows and antique urns over the doors, the whole conceived in a French spirit.

Rehn's last great manor house interiors at Övedskloster, Forsmark and Ljung mark the shift towards a Pompeian version of the antique style that had become popular after Gustav III's journey to Italy in 1783–84. Jean-Baptiste Masreliez and his brother Louis also began to introduce antique references in their designs for furniture, wall panels and stoves from the 1780s. Other architects, such as C.F. Adelcrantz, emulated the columned stove in the form of a rectangular sacrificial altar set beneath a round column that Rehn had first used in 1780 at Ljung Manor House.

Carl Fredrik Adelcrantz (1716–96), who was a year older than Rehn, was appointed Superintendent and Director of Works at the Royal Palace in 1741, and of all public buildings in Sweden from 1757. The Chinese Pavilion and the theatres at Drottningholm and at Ulriksdal bear his signature, although his role as an interior architect was so consistent with Rehn's that it is often difficult to distinguish their work. Nevertheless, their shared experience under Hårleman and their development towards a stricter form of Neo-Classicism is highly significant. Adelcrantz's most important manor house is Sturehof, near Stockholm, which was constructed around 1780 for Gustav III's Finance Minister, Baron Johan Liljecrantz. The main building and its well-preserved interiors are considered one of the period's best examples of a unified Gustavian classicism. Its tiled stoves produced by the Marieberg ceramic factory and painted wall panels by Lars Bolander represent the transition from Rococo decoration to early Neo-Classical sobriety, and presage the strict Neo-Classicism that was to dominate the foremost interiors of the 1790s.

Gustav III's trip to Italy is usually seen as marking the introduction of the Gustavian period. During this trip the king's contact with Louis-Jean Desprez, who was initially employed as a theatre designer, came to have a great influence on Swedish architecture and interiors. The Neo-Classicism that had already developed in France and England drew its models above all from copper engravings such as the *Antichità di Ercolano* and the Raphael loggias in the Vatican, as well as from studies of ancient Roman buildings. The Adam brothers also influenced Swedish architects' work. Gustav III's pavilion at Haga illustrates the shift in taste characteristic of the Gustavian style. Desprez's use of a temple design and of specially purchased antique sculptures and architectural details is evident in the plans for the palace, which was to be a synthesis of a Roman circular temple with a Pantheon in its centre, and a Greek colonnaded temple. This was clearly a personal solution devised by Desprez, but it gained a great following in the succeeding decades, even if on a more reduced scale.

At Bjärka-Säby in Östergötland, F.M. Piper introduced the severe, rigidly circular central room to Sweden. Piper had studied for a long time in England, and consequently it was English as much as French influences which dominated the last decade of the 18th century. A counterpart to Piper's English-style interiors was provided by the classical tradition among architects and designers such as Rehn, Erik Palmstedt, Olof Tempelman and Jean-Baptiste and Louis Masreliez, who were all trained in the French tradition. Gustav III's palace was never completely realized, but the sketches and the surviving models were to be significant for architects of a later generation right up until the middle of the 19th century. Instead, it was the so-called King's Pavilion at Haga that most strongly expressed the taste for the Pompeian classical style, with its low column-shaped or altar-shaped tiled stoves and graphically decorated grotesque wall panels.

The faience factory at Rörstrand that opened in the late 1730s was responsible for the production of many of the stoves that survive today. These include a new type of architecturally designed tiled stove which, unlike the stepped stove, which narrowed towards the top and had identical small tiles, was made of large-format tiles, with architectural mouldings and cornice, as well as pilasters and niches. The design that was to dominate for the rest of the century had these large tiles, bevelled corners and two sections, consisting of a shelf or a mantel on the lower section and a recessed, equally wide upper section, often with a crowning cornice: all this offered scope for a great variety of decoration.

For much of this period it is difficult to distinguish between the practical and aesthetic imperatives in the design of stoves for important rooms. Until the end of the 1760s white glazed tiled stoves provided almost the sole form of decoration within interiors, but from the 1770s their prime function was as a source of heat. Marieberg's faience factory first began to produce tiled stoves in 1767, and the earliest extant example is now at Ulriksdal Castle. From the 1770s production increased, and within a few decades fine copies of Marieberg stoves were being produced as far north as Umeå and as far south as Karlshamn. These stoves were painted in several colours.

A cheaper method of improved heating was the single tile-stoves called *rorspis*, an example of which was used at Läckö Castle. Such stoves were widely used throughout Sweden

Scandinavia: design for Prince Carl's dining room, by Louis Masreliez, 1790s; Royal Palace, Stockholm

during the 19th century and were found in both cabins and the barrack-like lodgings of the mines as well as in the fruit stores, orangeries and the more simply decorated living rooms of manor houses. They were thus more characteristic of genuine Swedish interiors than rooms decorated under foreign influence or in an individual architect's style.

By the beginning of the 19th century the influence of Roman and Renaissance classicism had become more widespread. In the Stockholm area grotesque and candelabra ornaments derived from Louis and Jean-Baptiste Masreliez and their work for the Haga Pavilion. This building, decorated around 1790, is the style's most important example, but even at Tullgarn, Rosersberg and in some rooms at the Stockholm Palace it is clearly evident that the decor was adapted from engravings illustrating antique excavations.

During the summer months decorative painters, including those working at the Royal Theatre, worked on manor house interiors, for instance at Bernhammer in Västmanland. In contrast to the paintings on linen commissioned during the Rococo period, wallpaper and coloured ornamental borders printed on paper became more popular. Classicising paper ornaments printed in Paris were hung at Varnanas in Småland, for example, and at Rydboholm in Uppland. Comparatively few wallpapers were printed in Sweden before the middle of the 19th century, however French imports of both panoramic papers and repeating patterns were widespread in fashionable interiors from the 1820s. During the late 18th century, larger entertaining rooms often featured a cooler architectural division, and granite, porphyry and marbling on walls and panels increasingly took over from decorative painting. The favourite subjects during the 1790s for overdoor panels printed on paper included kneeling winged genii with Bacchus heads, masks, flowers, and fruit-filled bowls.

Progressive tastes in the relatively few stone houses built during the first decade of the 19th century favoured monochrome walls or wall panels painted as drapery, especially in combination with printed borders beneath the ceiling mouldings. This style has been described as the "stone style": panels,

Scandinavia: design for the Vita Havat Hall, by Axel Nyström, 1844; Royal Palace, Stockholm

high double-doors and ceiling mouldings emulated the appearance of stone temple rooms, even though the materials used were paper, wood and paint, as a result of the economic depression that lasted from the 1790s until the mid-1810s.

Marbling and graining were simpler, indigenous methods of following fashionable foreign trends. These techniques began to appear around 1790 when walls were painted pink or red with grey grounds in a manner that consciously imitates red porphyry and grey granite. One of the country's earliest and best preserved examples of painted faux porphyry and granite is in the foyer of the Drottningholm Theatre, which was decorated for Gustav III around 1790 after designs by Desprez. By the beginning of the 19th century, such effects had come to dominate halls and corridors, and the less formal areas of the house. Nevertheless, silk damask remained the preferred form of wall treatment in state bedchambers and drawing rooms, even if such luxuries could be afforded only by the scions of royal houses, nouveau-riche merchants, and wealthy landowners.

Carl Christopher Gjörwell (1766–1837) and Carl Fredrik Sundvall (1754–1831) were two of the most important architects providing Neo-Classical domestic interiors before the emergence of Neo-Renaissance styles in the 1840s. Fredrik Blom (1781–1853), a fortifications officer, held a position close to Carl XIV Johan, and in addition to barracks in Stockholm and a church for the Admiralty – the Skeppsholmen Church – he received the commission to build a summer palace for the king on Djurgården. This wooden building in prefabricated

parts was decorated in a Swedish Empire style inspired by French sources, and fulfilled the king's need to supervise his troops at Gärdet and to acquire a palace for personal entertaining. Rosendal was built from 1823 and was completed between the end of the 1820s and the early 1830s. It had the character of an informal craft museum, in which the choice of furniture, textiles and artistically produced objects functioned simultaneously as examples of Swedish industrial production, ranging from silk cloth woven by the Almgren weavers in Stockholm to porphyry from the works in Dlarne.

Axel Nyström (1793–1868) was Professor at the Academy of Art and Stockholm city architect, and he led the critics of the Neo-Classical tradition, even though his own architecture and interiors drew directly upon it. A new taste in interiors emerged, favouring the Neo-Renaissance and the Neo-Rococo, with their richer decorative effects. As palace architect, Nyström renovated some interiors at the Royal Palace by knocking together two rooms to give his decorative schemes greater weight.

Like Nyström, Johan Fredrik Åbom received a string of official commissions, as well as private ones, for the new interiors of several large manor houses such as Nynäs in Söderland and Dylta Mill in Närke. Important ingredients in these interiors included decorative painted ceilings, tall double-doors with decoratively shaped mouldings, cornices and panels painted in imitation veneer. Entrance halls were characterised by rich wall decoration, especially in combination with a monumental staircase, and by the articulation of the wall with columns and

pilasters. Large colourful, patterned wallpapers dominated the living quarters, together with tall, often monochrome tiled stoves.

A break with the symmetry and clarity of classicism is first expressed in Fredrik Wilhelm Scholander's new interiors and in his restorations of older castles and manor houses. His most significant work was the decoration of Ulriksdal, where he also designed a new free-standing palace chapel. Scholander was bewitched by the Middle Ages, and his taste for the variation and richness of Venetian and German medieval villages was transferred to 17th- and 18th-century buildings. Ulriksdal, which had deteriorated into a war hospital during Carl Johan's period, became Crown Prince Carl's (Carl XV) pleasure palace. Together the king-to-be and Scholander created historicising medieval rooms with stained-glass windows and tall Renaissance panels – both old ones purchased in Germany and newly-made examples. These interiors offered emotional links with the past for people who dreamed of lost ideals. A museum approach, which had become increasingly dominant during the 19th century, was also explored at Ulriksdal when Carl XV completed the palace in a series of historical styles, with collections displayed in room arrangements. In the king's will of 1872 he bequeathed the completed collections to the state to form the first museum of applied arts. The Renaissance and Rococo woven tapestries, and the Baroque gilt-leather hangings, gave the rooms an atmosphere and richness which served as models for contemporary, industrially-produced woven and paper wallhangings.

The period of these historicising styles, between 1850 and 1900, was also a time of large exhibitions. At the art and industry exhibitions examples of glass, porcelain, textiles, iron and furniture were exhibited in styles reflecting the tastes generally current in the rest of Europe. Neo-Gothic, Neo-Renaissance and Neo-Baroque patterns dominated until the turn of the century, with increased sales of industrially produced objects for interior decoration for well-to-do consumers.

Some attempts to launch a more distinctively Swedish or Scandinavian style were made by the painter Johan August Malmström in collaboration with the architect Magnus Isaeus, who designed an Old Norse service for the Gustavsberg porcelain factory in the 1860s. In addition, several architects produced furniture in the Old Norse style at the end of the 19th century.

The ideas of the British Arts and Crafts Movement also had a strong impact in Sweden during the late 19th and early 20th centuries and the vision of artistic domesticity propounded in the watercolours of Carl Larsson proved hugely popular among the country's educated and wealthy professional classes. The 1920s witnessed a revival of these rural craft traditions, with Swedish classicism (known as "Swedish Grace") burgeoning at home and abroad, and winning prizes at the 1925 Paris Exposition des Arts Décoratifs.

From this point on many of the best-known 20th-century Swedish architects and designers were committed to Modernist approaches to design. Bruno Mathsson (b.1907), for example, has been one of the country's most innovative furniture pioneers; his anthropomorphic and subtly curved forms won acclaim at the New York World's Fair in 1939. Mathsson's emphasis upon natural forms and the honest treatment of

materials, and his desire for a collaboration between artists and industry, perfectly encapsulate the aims of the movement known as Scandinavian Modern which dominated Swedish design until the 1960s.

Finland

For the greater part of its history Finland has been colonised by its neighbours, and much of the country's architecture and design has therefore been dominated by foreign influences. From the 13th century until 1809, Finland was the eastern half of the Swedish kingdom, and, following Sweden's defeat in the 1808–09 Swedish-Russian war, it became a satellite state of the Russian empire until its liberation in 1917. Despite this, there has always been a strong tradition of native culture, and this formed the basis of the resurgence of Finnish nationalism from the mid-19th century onwards. Much of the focus for this nationalism stemmed from the rich oral heritage of *Kalevala* songs and legends that predated the introduction of Christianity and that flourished in the Finnish-speaking rural areas that lay behind the strip of Swedish-dominated coastal towns. Since the mid-19th century these legends have provided the basis for a national identity and the growing political and cultural moves toward national sovereignty. The desire to express a specifically Finnish heritage, as distinct from one arising from Swedish and Russian influences, has remained strong during the 20th century, particularly within the large Finnish-speaking population.

The rediscovery of a Finnish heritage is closely linked to the survival and revival of the Finnish language. Even prior to Erik the Holy's crusade in the 1150s, which brought Christianity to Finland, a Swedish-speaking population had settled along the coast in the southwestern areas of the country. Another crusade in 1249, led by Birger Jarl, consolidated Swedish interests. During the 14th century, Finland's northern coastal strips also became Swedish-speaking, and Swedish remained the country's official language until the end of the 19th century. The *Kalevala* was revived by the historian Elias Lönnrot, who produced the first published version of this national epic in 1835. This event signalled the beginnings of Finnish nationalism and the creation of the modern conception of Finland as a separate culture and country.
